Health and welfare. Thailand's health and social-welfare services remain far from adequate. The emigration of potential medical practitioners to more lucrative practices in the West has tended to undermine the government's attempts to upgrade services within the country. Mobile medical centres and helicopters attempt to alleviate the concentration of facilities in Bangkok and the regional centres. The doctor-patient ratio is poor, and medical practice on the midwife level is common. Infant mortality and diseases of childbirth are leading causes of death, whereas malaria has been widely reduced through the use of pesticides, although such agents as DDT also have contributed to the devastation of many forest animals as a side effect.

Only Bangkok and a few other large municipalities have housing shortages. The construction of government-financed housing cannot keep pace with demand, and slum areas occupy some parts of the city.

Cultural life. It formerly was thought that the Thai's original home was in China, but it is now generally believed that Tai-speaking peoples originated in northern Vietnam and began settling the Indochinese Peninsula and southern and southwestern China about 1,000 years ago. These people, however, brought with them many cultural institutions of the Chinese. As they moved southward into what is now modern Thailand, they encountered Mon and Burman peoples from the west, Javanese from the south, and Khmer from the east and were influenced by their cultural traditions. In addition, an Indian presence already had been established in the region, and the continuous absorption of Indian culture became a significant component of Thai cultural development.

The royal palace plays an important role in leading and preserving Thai culture through frequent royal functions and state ceremonies. Among these is the *kaṭhina,* or robe-offering, ceremony, a colourful pageant marking the end of *vassa,* the period of Buddhist monastic retreat. It takes place with a procession of royal barges on the Chao Phraya River, reconstructing a tradition dating from the earliest days of Buddhism. Thai temples hold ceremonies to mark the special events of the Buddha's life, which often are accompanied by fairs attracting large crowds to the temples.

Silpakorn University in Bangkok provides training in all Thai fine arts, including drama and music. The university also designs buildings for the government and for religious institutions in styles that preserve traditional Thai architectural forms. Other important national cultural institutions include the Royal Institute, the Siam Society, and the National Museum, all located in Bangkok.

The arts. Religion has had a major influence on Thai artistic expression and is especially manifested in the sculpture of Buddhist images. Traditional Thai architectural style also is best seen in the multiple-structured temple compounds. Wood is usually the basic construction material, with the walls made of bricks and plaster. The ornamental parts are generally gilded and enriched with glass mosaic, gold leaf, porcelain, stucco, lacquer, and inlaid mother-of-pearl. Remnants of the original sites of palaces and temples can still be found in many of the old provincial centres. In Chiang Mai the old, square city walls are still extant, with numerous Buddhist temples scattered inside and outside the walls.

Architecture

Porcelain and pottery, at first made primarily for utilitarian purposes, later came to be regarded and fashioned as objects of art. Thai painting is probably derived from India and Sri Lanka and is mostly religious. The paintings, executed by anonymous monks or dedicated laypeople, are usually drawn on temple walls.

Traditional Thai music shares close affinities with the musical forms of Laos and Cambodia. There are three orchestral types: *pi phat,* which are used at court ceremonies and in the theatre; *kruang sai,* which perform at village festivals; and *mahori,* which accompany vocalists.

Press and broadcasting. The first type for printing the Thai written language was derived by a British military officer in 1828, and the first printing press was brought to Thailand by an American missionary in 1836. The Thai government first made use of the printing press in 1839, when a royal proclamation banning opium smoking and trade was printed. The press is the oldest of the mass media, with daily newspapers in Thai, Chinese, and English. The state directly controls radio and television broadcasting, but newspapers and periodicals are under private ownership and enjoy a wider freedom than elsewhere in Southeast Asia. Great care is taken, however, to depict the royal family and monarchy positively. (P.P.A./Ja.A.H.)

For statistical data on the land and people of Thailand, see the *Britannica World Data* section in the BRITANNICA BOOK OF THE YEAR.

HISTORY

The modern Thai are descended from a much larger group of peoples who speak Tai languages. Tai-speaking peoples are found from extreme northeastern India in the west to northern Vietnam in the east and as far south as the central Malay Peninsula. In the past scholars held that a parent group called the Proto-Tai originated in southern China and pushed south and west from the China landmass into northern mainland Southeast Asia. Most scholars now believe that the Tai came from northern Vietnam around the Dien Bien Phu area and that about 1,000 years ago they spread from there northward into southern China, westward into southwestern China, northern Myanmar (Burma) and northeastern India, and southward into what are now Laos and Thailand.

Early Tai culture. The Tai were lowland peoples who historically settled along river valleys in northern mainland Southeast Asia and southwestern China. There they formed small settlements where they practiced subsistence agriculture based on rice cultivation, supplemented by fishing and gathering forest products. Early in their history the Tai domesticated animals: they used water buffalo for plowing and ritual purposes and pigs and fowl for food. Women were accorded relatively high social status and could inherit property. The Tai practiced animism; they believed that spirits could be benevolent or malevolent and needed to be propitiated through offerings and special ceremonies.

The *müang*

The basic unit of Tai political organization was the *müang,* or group of villages, ruled by a *chao,* or hereditary chief or lord. During the 1st millennium AD the political strengths of the *müang* system enabled the Tai to move out of their original homeland until, by the 8th century, they had expanded across much of northern mainland Southeast Asia. By the 11th century they had begun to filter down into the area of present-day Thailand, and by the middle of the following century they had formed petty principalities there.

Mon-Khmer civilizations. As the Tai moved into mainland Southeast Asia, they came in contact with peoples speaking Mon-Khmer languages who had long inhabited the region. During the early centuries of the 1st millennium AD, Indian traders traveling to China had carried Hindu and Buddhist beliefs and practices to some of these peoples. Among them were the Mon of Myanmar, the first peoples in mainland Southeast Asia to adopt Buddhism. Between the 6th and 9th centuries the Mon established several small Buddhist kingdoms within the area encompassed by present-day southern Myanmar and central Thailand. From what are now the towns of Nakhon Pathom and Lop Buri (Lopburi) in west-central Thailand, they extended their power eastward across the Khorat Plateau, northward as far as Chiang Mai (Chiengmai), and northeastward into what is now Laos. These Mon kingdoms collectively are called Dvaravati. The Dvaravati period is noted for its artwork, particularly its Buddhist sculptures and votive images made of terra-cotta or stucco.

As the Tai moved south into mainland Southeast Asia, they also encountered the Khmer of Cambodia. Between the 9th and 13th centuries Khmer rulers expanded their domains from their capital at Angkor, establishing an empire that at its height under Jayavarman VII (ruled 1181–*c.* 1220) extended over approximately half of modern Thailand. While Mon kingdoms were predominantly Buddhist in character, Khmer civilization—which found its supreme expression in the great temple complex at Angkor—was heavily influenced by Hindu ideas and practices. Tai contacts with the Khmer led to many Hindu elements entering Tai culture, particularly in regard to royal ceremonies or classical dance and literature. Many of these elements can still be found in modern Thai culture today.

By the beginning of the 13th century, the Tai were starting to place pressure on both the Mon and Khmer empires. The Tai were settled throughout the Chao Phraya basin, and a Tai ruler was established as far south as the principality of Nakhon Si Thammarat, on the Malay Peninsula. Through Nakhon Si Thammarat a new form of Buddhism—Theravāda—had entered mainland Southeast Asia from Sri Lanka. Theravāda Buddhism was carried by monks not only to areas under Mon or Khmer rule but also to the new Tai principalities that were beginning to emerge. Sukhothai and Lan Na (Lanna), the first major Tai kingdoms in Thai history, were Theravāda Buddhist.

Sukhothai and Lan Na. The kingdom of Sukhothai, situated in the upper Chao Phraya basin, was founded in the mid-13th century when a local Tai ruler led a revolt against Khmer rule at an outpost of the Khmer empire. During its first two reigns, Sukhothai remained only a small local power. Under its third ruler, Ramkhamhaeng (ruled *c.* 1279–98), however, Sukhothai power was extended to the south as far as Nakhon Si Thammarat, to the west into what is now Myanmar, and to the northeast as far as Luang Prabang in modern Laos. Not all these territories were conquered by force: many became vassal or tributary states to Sukhothai based on ties of kinship or personal loyalty and linked to it in a loose confederation.

Ramkhamhaeng

Ramkhamhaeng is renowned not only for extending the territory under Sukhothai control but also for leaving a remarkable stone inscription, which is considered by most scholars to contain the earliest example of writing in the Thai language. Written in 1292 and utilizing Khmer script adapted to the sounds and tones of Tai speech, it pictures the Sukhothai kingdom as prosperous, active in trade, and benevolently governed by a paternal monarch. According to the inscription, the state taxed its citizens modestly, treated all citizens (including non-Tai) alike, and provided justice for all. The Sukhothai period (mid-13th to mid-15th century) also is noted for its sculpture and pottery. Graceful bronze sculptures of the Buddha, especially those showing him in the walking position, are typical of the period, while the celadon ware made at Sukhothai and nearby Sawankhalok was exported throughout Southeast Asia.

Sukhothai was not the only Tai state in Southeast Asia during this period. In the mid-13th century in what is today northern Thailand, a Tai ruler, Mangrai (ruled *c.* 1259–1317; from 1292 to 1317 in Chiang Mai), conquered the ancient Mon kingdom of Haripunjaya and built a new capital at Chiang Mai. Under Mangrai and his successors, Lan Na—with Chiang Mai as its capital—became not only powerful but also a centre for the spread of Theravāda Buddhism to Tai peoples in what are now northeastern Myanmar, southern China, and northern Laos. Under Tilokaracha (ruled 1441–87), Lan Na became famous for its Buddhist scholarship and literature. During the 16th century Lan Na was conquered by the Myanmar and incorporated into the Burman empire. Subsequently, the central Tai (Siamese) states of Ayutthaya (Ayudhya, or Ayuthia) and Bangkok challenged Burman control over the area, but it was not until the 19th century that Lan Na was brought fully under Siamese rule.

The Ayutthayan period, 1351–1767. Whereas Sukhothai was an independent kingdom for only about 200 years, its successor, Ayutthaya—situated in the rich rice plains of the Chao Phraya River basin, about 55 miles

north of present-day Bangkok—lasted more than 400 years. During the Ayutthayan period the Tai consolidated their position as the leading power in what is now central and north-central Thailand, as well as throughout much of its southern peninsular region. Since many of Ayutthaya's neighbours called the country "Siam," or a name similar to it, the Tai of Ayutthaya came to be known as the Siamese.

Ayutthaya (Ayudhya) kingdom, mid-15th century.

Ayutthaya at first was only a small city-kingdom on the northwestern edge of the powerful Khmer empire. Within less than a century, however, Tai kings succeeded in pushing back the Khmer, and in 1431 they sacked their great capital of Angkor. Wars against neighbouring powers remained endemic, however, throughout the Ayutthayan period. In 1438 a greatly weakened Sukhothai was made a province of Ayutthaya. Lan Na, however, remained free of Ayutthayan control, although it was later brought under Burman influence.

The sack of Angkor

When the Siamese conquered Angkor, they brought many Khmer captives back to Ayutthaya with them. Some had been officials or craftsmen at the Khmer royal court. From them Ayutthaya's rulers adopted many Hindu practices that had been followed by the Khmer, including the concept of the ruler as god-king (*devarāja*). The king acquired powers of life and death over all his people. None but members of the royal family might gaze upon his face. He could be addressed only in a special language used exclusively for royalty, while those speaking to the king referred to themselves as "the dust beneath your majesty's feet."

The power of the ruler was enhanced not only through symbolic and ideological concepts drawn from Khmer-Hindu beliefs about the god-king but also through the centralization of political power. Trailok (ruled 1448–88) created a state in which the ruler stood at the centre of a series of concentric circles. As in the *müang* system, the outer circles were governed by hereditary lords, or *chao*. The inner circles, however, were administered by office-holders appointed by the king, and thus these operated to a limited degree on bureaucratic rather than hereditary lines.

The kings of Ayutthaya also issued formal codes of civil and criminal law based on the ancient Indian body of jurisprudence called the *Dharma-śāstra*. At the same time, a formal and highly complex hierarchical system assigned each person a varying number of units (called *sakdi na*) that designated one's rank within society. At the bottom of the scale, a slave was worth 5 units; freemen were ranked at 25 and above, while the heir apparent was assigned no fewer than 100,000 units.

The mass of the people in Ayutthayan times were peasant farmers, either freemen or slaves. The latter included war captives, bondsmen, and debtors. Freemen were obliged to work for six months each year for the local representatives of the king, to pay taxes, and to provide military service as required. An intricate patronage system extended throughout society, whereby clients provided their patrons with services in return for the protection of the patrons. Ayutthaya was an underpopulated society, and the constant need for manpower helped protect clients from excessive demands by patrons; if the demands of the patrons became too burdensome, the freeman could always move and take up new land as a last resort.

Despite the introduction of Brahmanism into court ritual and the admixture of animism and superstition that pervaded religious practice at all levels of society, Theravāda Buddhism took deep root throughout Siam during Ayutthayan times. The Buddhist monastic establishment played an important role in society, forming a focal point for village life, providing young males with an education, and offering those who elected to remain in the monkhood (sangha) a channel for upward social mobility.

Ayutthaya at its height was one of the wealthiest and most cosmopolitan cities of its day. Although it lay inland, it was easily accessible to oceangoing vessels traveling up the Chao Phraya River, and it became a thriving international trade emporium. It was during this period that European traders and travelers first started coming to Siam. The Portuguese reached Siam as early as 1511, following their conquest of Malacca (Melaka) on the Malay Peninsula; they were followed in the 17th century by Dutch, English, Spanish, and French traders and missionaries. Ayutthayan kings permitted settlements of Chinese, Indian, and Persian, as well as European, traders; they employed Japanese warriors and allowed Western missionaries to preach within Ayutthayan domains. In addition to engaging in extensive trade with China, Southeast Asia, and India, the rulers of Ayutthaya also sent triennial tribute missions to the Chinese imperial court, established Buddhist missions in Sri Lanka, and sent emissaries abroad as far afield as Europe. King Narai (ruled 1656–88) initiated a series of diplomatic exchanges between Ayutthaya and the French court at Versailles and even appointed a Greek adventurer, Constantine Phaulkon, as his chief minister. Eventually, however, the Europeans became overly zealous in their efforts to convert Buddhist Siamese to Christianity. In 1688 the Siamese expelled the French from Ayutthaya and all but closed their doors to the West for the next 150 years.

European contact

The primary threat to Ayutthayan sovereignty came not from Europe, however, but from Myanmar. In 1569 a force from the Burman state of Toungoo overran Ayutthaya and devastated the country for miles around. Led by Naresuan (ruled 1590–1605), Ayutthaya recovered its independence. Conflict with Myanmar persisted, however, and in the mid-18th century Burman armies once again captured Ayutthaya. This time the city was not to recover. Following the sacking of the city in 1767, the king and members of the royal family, along with thousands of captives, were deported to Myanmar. All Ayutthayan records were burned and its works of art destroyed.

The Thon Buri and Early Bangkok periods. A new era in Thai history began with the rise to power of Taksin, a military commander of great skill and charismatic personality who succeeded in pushing back the Burmans and seizing political power. In 1767 Taksin established his new capital at Thon Buri (Thonburi), on the opposite side of the Chao Phraya River from modern Bangkok. The new location was less accessible to the armies of Myanmar

than Ayutthaya had been and was ideally situated for the conduct of seaborne trade and commerce. Capitalizing on the trade relations that Siam had already developed with China, Taksin encouraged Chinese merchants and craftsmen to take advantage of the economic opportunities offered by the site of his new capital. Large numbers of Chinese settled permanently in Siam, where their involvement in business and trade—coupled with the tax revenues that these activities provided—helped restore the country's devastated economy.

Taksin not only recovered the territories that had formerly been part of the Ayutthayan empire but set out to extend Siamese control over new areas. His armies annexed part of what is now northeastern Cambodia and advanced up the Mekong River as far as present-day Vientiane, Laos. In the south they subdued the northern part of the Malay Peninsula, while to the north they pushed the Burmans out of the old northern Tai kingdom of Lan Na.

Within a few years of seizing power, however, Taksin showed signs of serious mental instability, and in 1782 he was overthrown. He was succeeded by his former military commander, known by his official name of Chao Phraya ("Great Lord") Chakri. As Rama I (ruled 1782–1809), he became the first king of the still-reigning Chakri (or Chakkri) dynasty.

Rama I

The early Chakri kings and a resurgent Siam. One of Rama I's first acts was to move his capital across the Chao Phraya River to Bangkok, which at the time was still a small village. By the mid-19th century, Bangkok had become a city of some 400,000 people, swelled by the huge numbers of Chinese who had poured into Siam during these years. In addition to settling in Bangkok, the Chinese established trading settlements inland, some of which grew into small towns. The Chinese thus gained control over both the internal and foreign trade of the country.

Myanmar continued to harass Siam throughout the early Chakri reigns. In 1785 it launched a massive invasion of the country, which was defeated only with great difficulty. Other lesser attacks followed. Not until the 1820s, when British encroachment on Myanmar forced Burman attention inward, was Siam able to relax its vigilance along its western borders. In the east Rama I and later Rama III (ruled 1824–51) reduced Khmer territories to vassal status, while in the south Rama III strengthened Siamese control over tributary states of the Malay Peninsula. Rama III also put down a major uprising in the north under Chao Anou, the young Lao ruler of the kingdom of Vien Chan (Vientiane). In 1827, Siamese armies razed and plundered Vientiane; thousands of Lao were taken prisoner and deported to central Siam.

The early Chakri kings sought to restore the cultural heritage of Ayutthaya. New temples and palaces were built following the same styles and even using the same bricks that had embellished Ayutthaya. Rama I reestablished court rituals, issued comprehensive law codes and authoritative Buddhist texts, and helped revive the sangha by placing learned and pious monks in leading positions within the Buddhist hierarchy. The early Bangkok period was also one of great literary flowering. The *Ramakian,* the Thai version of the Indian epic *Rāmāyaṇa,* was set to verse during the reign of Rama I, and the popular Chinese novel *San-kuo chih yen-i* (*Romance of the Three Kingdoms*) was translated into Thai. Rama II (ruled 1809–24), an accomplished poet, was a noted patron of the arts; Sunthon Phu, Thailand's greatest poet, wrote some of his best-known works during Rama II's reign.

Western influence also grew in mainland Southeast Asia during the early years of the 19th century, and with it came increasing Western pressures on Siam. When Britain declared war on Myanmar in 1824, Rama III feared that the British might also attack Siam. He subsequently agreed to sign the Burney Treaty (1826), which set conditions for the conduct of trade between the two countries.

Mongkut and the opening of Siam to the West. Demands for free trade and diplomatic representation in Siam accelerated with the British advances into Myanmar and Malaya and the opening of several Chinese ports following the first Opium War with China (1839–42). In 1855 Queen Victoria sent Sir John Bowring as her personal emissary to Siam to push for an end to all trade restrictions and to secure the rights to establish a British consulate in Bangkok and to set up separate law courts to try cases involving British subjects (extraterritoriality). The resulting Bowring Treaty (1855), in which Siam acceded to these demands, was followed shortly by similar treaties with other major European powers and with the United States. Although these treaties left Siam intact politically, they severely reduced the country's sovereignty and independence.

The Bowring Treaty

The opening of Siam to world trade and the development of a cash economy brought major changes to the country. The Bowring Treaty deprived the Siamese government of large sums in customs duties, one of its major traditional sources of revenue, forcing it to increase taxes in their stead. Large areas of the Chao Phraya basin were planted in rice and other cash crops for the world market, while the need to transport goods from the interior to the port of Bangkok led to the growth of canal systems and marketing networks.

The years following the Bowring Treaty were also marked by an increase in foreign influence in Siam. King Mongkut (Rama IV; ruled 1851–68) appointed several Western advisers and assistants to his court, including the Englishwoman Anna Leonowens, who became tutoress to his children. She later published her romanticized and inaccurate depiction of Mongkut's court. Foreign nationals began to take up long-term residence in Bangkok. Missionaries, although largely unsuccessful in converting Siamese to Christianity, set up the first Western medical facilities, secular schools, and printing presses in the country. Mongkut took great interest in the new Western ideas that were beginning to come into the country. He studied Latin, mathematics, and astronomy with the scholarly French Roman Catholic missionary Jean-Baptiste Pallegoix and English with American Protestant missionaries, one of whom, Dan Beach Bradley, later founded the country's first newspaper.

Mongkut was already 46 years old when he came to the throne. He had spent 26 years in the monkhood, during which time he had become a keen scholar of Pāli (the language of the Theravāda texts) and an expert in Buddhist doctrine. Mongkut also had become concerned that many superstitious practices had grown up around the core Theravāda teachings, and he established the reformed Thammayut sect, which was based on the purification of Buddhist practice. The Thammayut order later came to dominate the Thai monkhood. Although Mongkut was an absolute monarch, he began to break down the age-old tradition of treating the king as a god. He traveled widely throughout his kingdom, inquiring about the conditions of his subjects. He also was the first Siamese monarch to allow his subjects to gaze directly upon his face. Mongkut's willingness to adapt traditional Siamese patterns to make way for more modern ideas helped pave the way for the more profound social and political changes that were to take place in Siam under his successor.

Chulalongkorn and the foundations of modern Thailand. Mongkut was succeeded by his 15-year-old son Chulalongkorn (Rama V; ruled 1868–1910). Because of Chulalongkorn's youth, the country was ruled by a regent until the prince came of age in 1873. Chulalongkorn was faced with continuing Western pressure, and he maintained his father's policy of making territorial concessions to the West in the hope of retaining Siam's overall independence. In 1893, after French gunboats forced their way up the Chao Phraya River to Bangkok, he was forced to cede all Lao territories east of the Mekong River to France, and in 1907 the French took over three territories in northwestern Cambodia and Lao territory west of the Mekong that had been under Siamese suzerainty. Two years later the Siamese government lost rights over four Malay states to the British.

Cession of territory to France

At the same time as he sought to fend off the Western powers from without, Chulalongkorn undertook major reforms within the country. These were often difficult to achieve, since they undercut the power bases of influential men at court. The young king proceeded gradually, assisted by several of his brothers and half-brothers; many

of these—in particular the brilliant and energetic Prince Damrong Rajanubhab—were men of outstanding ability. The internal reforms carried through during Chulalongkorn's reign included the reorganization of the government into ministries with functional responsibilities and the creation of a centralized bureaucracy, the institution of a uniform and centralized system of administration over the outlying provinces, the systematization of government revenue collection, the abolition of slavery and labour-service requirements, the establishment of law courts and reformation of the judiciary, the introduction of a modern school system, and the construction of railways and telegraph systems. In addition, he backed a major reorganization of the Buddhist monkhood, bringing all monks throughout the country into the sangha as a nationwide religious hierarchy that was linked at its apex to the king. By any standards, the sheer scale of Chulalongkorn's reforms are remarkable, and his reign is commonly regarded as one of the greatest in Thai history.

Vajiravudh and Prajadhipok: the last absolute monarchs of Siam. Chulalongkorn's policies were continued by his sons Vajiravudh (Rama VI; ruled 1910–25) and Prajadhipok (Rama VII; 1925–35). In 1917 Vajiravudh, the first Thai monarch to be educated abroad, opened Thailand's first university, which he named for his father. In 1921 he made universal primary education compulsory throughout the nation. He also passed an act aimed at assimilating the growing number of Chinese entering the country, which declared that all students must be taught to read, write, and understand standard Thai (Siamese) and be instructed in the duties of being a good Siamese citizen. Vajiravudh is noted principally, however, for promoting Thai nationalism. In his voluminous writings he constantly stressed the need for his subjects to be loyal to nation, religion, and king. He not only strengthened the army and navy but created a paramilitary organization, the Wild Tiger Corps, that was independent of the regular army. In 1917 he took Siam into World War I on the side of the Allies, and after the war he succeeded in persuading the Western powers to give up their extraterritorial rights in Siam. Vajiravudh also passed a law in 1913 that required all Siamese to adopt surnames, and he encouraged his people to take on more modern clothing styles and to abandon such habits as chewing betel nuts.

Vajiravudh also was notorious for his extravagance, and his successor, Prajadhipok, inherited serious fiscal problems from his brother. The new king ordered layoffs throughout most government departments, both at the start of his reign and again during the Great Depression of the 1930s. The cuts caused severe economic hardships to many government officials and their families and were among the many reasons for the rise of popular discontent with the monarchy during his reign. In addition, a growing middle class was becoming unhappy with the domination of the government by members of the royal family and with the absence of wider participation in political decision making, and a popular press emerged that was able to give voice to these discontents.

Rise of popular discontent

The 1932 coup and the creation of a constitutional order. One focus of civilian discontent centred around a group of students who were educated overseas and were deeply dissatisfied with the tight political control that Siam's ruling families held over the country. Some of these students became politically radicalized during the course of their education in Europe in the 1920s and early 1930s. They were led by Pridi Phanomyong, a brilliant young lawyer studying in Paris, who became the leader of an association of overseas Siamese students. He was closely associated with a career artillery officer, Luang Phibun Songkhram (Phibunsongkhram), who was then studying military science in France. In 1927 Pridi and Phibun formed the People's Party, which became the nucleus of a revolutionary group plotting to overthrow Siam's absolute monarchy. On their return to Siam the two men and their associates, who became known as the Promoters, built up a revolutionary following among students, low-level government officials, and military officers.

On June 24, 1932, while Prajadhipok was away from Bangkok, the Promoters staged a bloodless coup; they seized control of the army, imprisoned the royal officials who had constituted the ruling group, and persuaded the king to agree to rule under a constitution. Under the new government, a State Council and National Assembly were established. Many members of the new government had not played a direct part in the coup, and some were quite conservative in their political thinking. In early 1933, when Pridi drew up an economic plan for the country that was far more radical than many members of the new government could accept, feelings ran so high that the king was forced to suspend the National Assembly. Fearing that the royalists would regain control of the government, the military leaders forced the reconstitution of the Assembly. This was followed by an attempted royalist countercoup in October 1933 under Prince Boworadet (Bavoradej), a cousin of the king. Although there was no evidence of royal collusion, Prajadhipok found his position untenable. In early 1934 he left for England, and in March 1935 he abdicated. A regency council was appointed to act for his successor, Prince Ananda Mahidol, then a schoolboy studying in Switzerland, until he came of age.

Between 1933 and the end of 1938 the military grew ever stronger. The years just before World War II were marked by a tripling of the military budget, the establishment (1934) and subsequent spread of a paramilitary youth movement with fascist overtones, and a growing alliance with Japan.

The Phibun dictatorship and World War II. In December 1938 Phibun Songkhram took over as military dictator, and the following year he changed the name of the country from Siam to Thailand. He embarked on a strongly nationalistic policy that was chauvinistic and anti-Chinese at home and irredentist and pro-Japanese abroad. In November 1940, taking advantage of the defeat of France by Germany the previous June, Phibun invaded French territories in western Laos and northwestern Cambodia that formerly had been under Thai control. Japan supported Thai claims to the disputed lands.

Invasion of French territories

Thailand's leaders nonetheless sought help from Britain and France against an increasingly aggressive Japan, but the British were too deeply involved in Europe to provide them with meaningful support. On Dec. 8, 1941, just after the Japanese attack on Pearl Harbor, Japanese troops entered Thailand and requested the right of passage through the country to facilitate their planned surprise rear attack on British-held Singapore. After a brief fight against the advancing Japanese, all Thai troops were ordered by Phibun to lay down their arms, and Thailand signed a full Treaty of Alliance with Japan; in January 1942 the Thai government declared war on Britain and the United States.

Thailand gained minor territorial concessions in Burma and Malaya, as well as in Laos and Cambodia, from its wartime alliance with Japan, but the Thai economy suffered greatly, ultimately undermining public confidence in Phibun. From 1942 onward, overseas resistance groups based in the United States and Britain made contact with similar groups within Thailand led by Pridi Phanomyong. Collectively called the Free Thai, they conducted raids against the Japanese and succeeded in infiltrating the government. In July 1944 Phibun was forced to resign, and in August 1945 Japan surrendered.

The postwar crisis and the return of Phibun. The chief problem facing Thailand in 1945 was how to restore its international reputation in view of its wartime alliance with Japan. The United States, however, had never accepted Thailand's declaration of war, which it believed to have been signed under duress. Once Thailand returned the territories seized from France in 1940–41, it was admitted to the United Nations, and its standing in the international community was restored. The immediate postwar years, however, were not easy for Thailand. Phibun narrowly escaped trial as a war criminal and temporarily retired from public life. Then, in June 1946, the recently enthroned Ananda Mahidol was found dead of a gunshot wound, an event that shocked the nation. Pridi Phanomyong was accused—falsely—of regicide and felt obliged to go into exile. Political life degenerated into factionalism and disorder, and in April 1948 the military, again led by Phibun, seized power.

As the international political climate became one of Cold War, the West began to look to Thailand as a potential bastion against the rise of communism and the growing influence of the Soviet Union and China in Southeast Asia. Thailand sent troops to join the United Nations forces during the Korean War, and in 1954 it became a charter member of the Southeast Asia Treaty Organization, a regional anticommunist defense organization to which the United States pledged its support. The establishment of a communist regime in China in 1949 aroused Phibun's fears about the spread of communism within Thailand and led him to carry out a series of measures directed against members of the Chinese community. He also imprisoned many leaders from other groups whom he feared might try to secede from the Thai nation, in particular the Lao of northeastern Thailand and the Malays in the south.

Between 1951 and 1957 the United States poured large amounts of economic and military aid into Thailand to build the nation's infrastructure and boost its military and police forces. This massive financial support laid the basis for an economic boom in Thailand that has continued to the present day. Access to these funds also rendered the military largely independent of the political process; an alliance of convenience developed between the military rulers—headed by Phibun and the newly emerging army chief, Sarit Thanarat—and the police, in which the latter suppressed Phibun's political opponents in return for a share of the political spoils.

Economic boom

Sarit was entrusted by Phibun with the buildup and modernization of the Thai army, and by 1954 he had risen to the rank of field marshal. Like a number of upper-echelon military officials during this period, Sarit had become heavily involved in business activities and served on numerous corporate boards. Under the Phibun government, most of the country's small number of manufacturing firms were government-owned, while imports and exports were tightly controlled. Sarit and many members of the middle class, particularly businessmen of Chinese descent, were disappointed by the poor economic results that Phibun's policy of economic nationalism generated. Over the next three years, public confidence in the Phibun regime waned, and in September 1957 Sarit took over the government.

Military dictatorship, economic growth, and the reemergence of the monarchy. Sarit was dictator from 1958 until his death in 1963, during which time he instituted new economic policies that favoured both domestic and foreign private investment. His commitment to economic development, coupled with a massive rise in foreign economic and military aid to Thailand (especially from the United States), led to a marked rise in Thailand's gross national product. Not only were large amounts of money funneled into the military, but there was a major increase in the construction of highways, irrigation projects, electrification schemes, and schools. Sarit also encouraged Bhumibol Adulyadej, who had succeeded his brother as king in 1946, to make the public more aware of the monarchy. The king and queen made trips around the country and sponsored public service activities, and by 1960 they had become widely popular. The monarchy, which had been in eclipse since 1932, once again became a significant institution in Thailand.

Sarit was admired by many as a strong and decisive ruler, but his popularity diminished significantly after his death, when the extent of his personal corruption became widely known. The aura of corruption haunted his successors, Thanom Kittikachorn and Praphas Charusathian, who jointly held power throughout the decade following Sarit's death. Their term of office also was noted for the continuing growth of the Thai economy and for Thailand's increasing involvement with the United States during the Vietnam War. By 1969 Thailand had more than 11,000 troops serving in Vietnam. Huge sums of American money continued to pour into Thailand throughout the Thanom-Praphas years, further driving up the level of economic development but also contributing substantially to the growth of corruption and to a rising gap in the standard of living between rich and poor. Popular disaffection grew—particularly in the impoverished northeast and among alienated groups such as the Muslim Malays in the south and the Hmong in the far north—gradually crystallizing into outright insurgency.

The Vietnam War

The 1973 revolution and its aftermath. Faced with growing internal dissent, Thanom made halfhearted attempts to introduce minor democratic reforms before reimposing direct military rule in 1971. For many Thai, especially the growing number of middle-class citizens educated abroad and exposed to Western democratic ideas, this undermined their vision of the country's future. Students, in particular, felt betrayed by the failure of the government to provide for reform and held huge public demonstrations calling for the promulgation of a constitution. Violence between police and students escalated, and in October 1973 Thanom and Praphas were forced to call on the king to restore peace to the country. Following a royal plea, the students agreed to disperse, but on October 14 Thanom and Praphas were forced to leave the country.

For the first time since 1932, the monarchy assumed a direct role in Thai politics. The king chose Sanya Dharmasakti, a former rector of Thammasat University, to be interim prime minister and to oversee the drafting of a new constitution. The constitution, promulgated in 1974, ushered in a brief period of parliamentary democracy in Thailand. The open debates in parliament about policy issues, however, were interpreted as an indication of political instability by ranking members of the military, while the triumph of communist governments in Vietnam, Cambodia (Kampuchea), and Laos in 1975 were pointed to as a threat requiring a stronger Thai government. In October 1976 the military, this time with the backing of the king, once again took control of the government and abolished both parliament and the constitution.

The new coup polarized the Thai political system. Many of the students who had led or supported the movement of the early 1970s went into the jungle to join what previously had been a small, rural-based communist insurgency. By mid-1977, the Communist Party of Thailand was beginning to mount an increasingly effective challenge to the military-backed government. Fearing increasing unrest, the military leaders—in yet another October coup—ousted the extreme right-wing government they had installed a year before and handed over power to General Kriangsak Chomanand, who was open to a more democratic type of government.

Growing insurgency

The search for a new political order. By 1980, when General Prem Tinsulanonda replaced Kriangsak, Thailand had established a system of government in which the military and the parliament shared power. Prem, who served as prime minister from 1980 to 1988, eliminated the threat of the Communist Party of Thailand by declaring a general amnesty. Thailand, however, faced a new threat along its eastern border from Vietnam following its occupation of Cambodia in 1979. In 1988, Chatichai Choonhavan, leader of the Chat Thai political group, replaced Prem as prime minister. For the first time since 1976, Thailand had a government headed by an elected, rather than a military, leader, but the military retained a veto over major policy decisions.

Political instability continued to trouble the country in the early 1990s. At the beginning of 1991, Chatichai's government, already criticized for corruption, went too far in challenging the military and was toppled by a junta. Led by General Sunthorn Kongsompong and including army chief Suchinda Kraprayoon, the junta promised free elections (subsequently held in March 1992) and appointed as prime minister Anand Punyarachun, a liberal, former diplomat, and business leader. Anand sought unsuccessfully to remain independent of the military, and Suchinda succeeded him as prime minister in April 1992. Suchinda's appointment was strongly opposed by advocates of democracy. In May the army met the escalating antigovernment demonstrations with bloody repression; the king intervened to defuse the situation, after which Suchinda resigned. Anand headed a caretaker government until new elections could be held in September. Parties opposed to military rule won a majority of seats and chose as prime minister Chuan Leekpai, who became the longest-serving elected prime minister in Thai history. Since 1992 govern-

ments have been based upon parliamentary majorities. The new constitution of 1997, which recognized broader rights for citizens than any previous constitution, reflected the growing influence of nongovernmental organizations and the emergence of a new civil society in Thailand.

Economic and foreign-policy developments. From the 1960s to the 1990s Thailand had one of the world's fastest-growing economies. By the 1990s it was considered to be part of a second wave of so-called newly industrializing countries, or NICs (including other countries of the Pacific Rim such as Malaysia and Indonesia), following in the path of such first-wave NICs as South Korea and Taiwan. In July 1997, however, a financial crisis hit Thailand and swept across most of East and Southeast Asia. In Thailand, financial institutions collapsed or were taken over and the economy slowed to a near halt. Foremost among those responsible for the crisis were the many finance companies that made short-term loans to fund long-term property investments.

From the 1950s through the '70s, Thailand's foreign policy was based on anticommunism and a special relationship with the United States. The withdrawal of U.S. forces from Vietnam, the communist takeovers in Vietnam, Cambodia, and Laos, the disintegration of the Soviet Union, and the end of the Cold War spurred Thailand to reassess its foreign policy. Since the 1980s the focus has shifted from security to trade, ties with the United States have weakened while those with Japan and China have been strengthened, and Thailand has encouraged regional economic relationships, even with its former enemies—Vietnam, Laos, and Cambodia. (E.J.K./C.F.Ke.)

Vietnam

The Socialist Republic of Vietnam (Vietnamese: Cong Hoa Xa Hoi Chu Nghia Viet Nam) is a densely populated nation occupying the eastern part of the Indochinese Peninsula. It has an area of 127,800 square miles (331,000 square kilometres). From north to south it extends about 1,025 miles (1,650 kilometres) and at its narrowest part is about 30 miles wide. Vietnam is bordered by China to the north, the South China Sea to the east and south, the Gulf of Thailand to the southwest, and Cambodia and Laos to the west. The capital, Hanoi, is located in the north, while the country's largest city, Ho Chi Minh City (formerly Saigon), is in the south. The current Vietnamese nation was established in July 1976, after a period of prolonged internal warfare that was fueled by Cold War politics and after being partitioned (1954–75) first militarily and later politically into the Democratic Republic of Vietnam, better known as North Vietnam, and the Republic of Vietnam, usually called South Vietnam.

PHYSICAL AND HUMAN GEOGRAPHY

The Annamese Cordillera

The land. *Relief.* Vietnam's principal physiographic features are the Annamese Cordillera (French: Chaîne Annamitique; Vietnamese: Nui Truong Son), extending from north to south in central Vietnam and dominating the interior, and two extensive alluvial deltas formed by the Red (Hong) River in the north and the Mekong (Cuu Long) River in the south. Between these two deltas is a long, relatively narrow coastal plain.

From north to south the uplands of northern Vietnam can be divided into two distinct regions—the region north of the Red River and the massif that extends south of the Red River into neighbouring Laos. The Red River forms a deep, relatively wide valley that runs in a straight northwest-southeast direction for much of its course from the Chinese border to the edge of its delta. North of the Red River the relief is moderate, with the highest elevations occurring between the Red and Lo (Clear) rivers; there is a marked depression from Cao Bang to the sea. In the Red River delta and in the valleys of the region's other major rivers are found wide limestone terraces, extensive alluvial plains, and low hills. The northeast coast is dotted with hundreds of islands composed mostly of limestone.

Compared with the area north of the Red River, the vast massif extending southwest across Laos to the Mekong River is of considerably higher elevation. Among its outstanding topographic features is Fan Si Peak, which at 10,312 feet (3,143 metres) is the highest point of elevation in Vietnam. South of the Black (Da) River are the Ta P'ing, Son La, and Moc Chau plateaus, which are separated by numerous deep valleys.

In central Vietnam the Annamese Cordillera runs parallel to the coast, with several peaks rising to elevations of more than 6,000 feet. Several spurs jut into the South China Sea, forming sections of the coast isolated from one another. Communication across the central ranges is difficult. The southern portion of the Annamese Cordillera has two identifiable regions. One consists of plateaus of approximately 1,700 feet in elevation that have experienced little erosion, as in the Dac Lac Plateau near Buon Me Thuot. The second region is characterized by heavily eroded plateaus: in the vicinity of Pleiku, the Kontum Plateau is about 2,500 feet above sea level, and, in the Da Lat area, the Di Linh Plateau is about 4,900 feet.

Drainage. Below the northern uplands is the Red River delta. Roughly triangular in shape, it extends some 150 miles inland and measures 75 miles along the Gulf of Tonkin. The delta can be divided into four subregions. The northwestern section has the highest and most broken terrain, and its extensive natural levees invite settlement despite frequent flooding. The low-lying eastern portion has benchmarks of less than seven feet above sea level in the vicinity of Bac Ninh. Rivers there form small valleys only slightly lower than the general surface level, and they are subject to flooding by the area's unusually high tides. The third and fourth subregions consist, respectively, of the poorly drained lowlands in the west and the coastal area, which is marked by the remains of former beach ridges left by the continuous expansion of the delta.

The Annamese Cordillera forms a drainage divide, with rivers to the east flowing to the South China Sea and those to the west to the Mekong River. South of the mountain range there is an identifiable terrace region that gives way to the Mekong River delta. The terrace region includes the alluvial plains along the Saigon and Dong Nai rivers. The lowlands of southern Vietnam are dominated by alluvial plains, the most extensive of which is the Mekong River delta, covering an area of 15,400 square miles in Vietnam. Smaller deltaic plains also occur along the south-central coast of the South China Sea.

The Mekong River delta

Soils. In northern Vietnam the heavy monsoonal rains wash away rich humus from the highlands, leaving slow-dissolving alumina and iron oxides that give the soil its characteristic reddish colour. The soils of the Red River delta vary: some are fertile and suitable to intense cultivation, while others lack soluble bases that make the growing of crops feasible. Nonetheless, the delta soils are easily worked. The diking of the Red River to prevent flooding deprives the delta's rice fields of enriching silts, necessitating the use of chemical fertilizers.

There are some two dozen soil associations, but certain soil types predominate. Among these are red and yellow podzolic soils (*i.e.*, soils that are heavily leached in their upper layers, with a resulting accumulation of materials in the lower layers), which occupy nearly half of the land area, and lateritic soils (reddish brown, leached tropical soils), which constitute about 10 percent. These soil types dominate the central highlands. Alluvial soils account for about one-fourth of the land in the south and are concentrated in the Mekong River delta, as are peat and muck soils. Gray podzolic soils are found in parts of the central highlands and in old terraces along the Mekong River, while regurs (rich black loams) and lateritic soils occur in both the central highlands and the terrace zone. Along the coast of central Vietnam are regosols (soft, undeveloped soils) and noncalcic brown soils.

Climate. The northern part of Vietnam is on the edge of the tropical climatic zone. During January, the coldes month of the year, Hanoi has a mean temperature of 63° F (17° C), while the annual average temperature is 74° F (23° C). Farther south, the average annual temperature in Hue is 77° F (25° C) and in Ho Chi Minh City is 81° F (27° C); in the highland city of Da Lat, it drops to 70° F 21° C). The winter season in northern Vietnam lasts

from November to April; from early February to the end of March there is a persistent drizzling rain, and March and April sometimes are considered to be a transitional period. The summer in northern Vietnam lasts from April or May to October and is characterized by heat, heavy rain, and occasional typhoons. In central and southern Vietnam the southwest monsoon winds between June and November bring rains and occasional typhoons to the eastern slopes of the mountains and the lowland plains. Between December and April there is a drier period that is characterized by winds of the northeast monsoon and, in the south, by high temperatures.

Plant life. The vegetation of Vietnam is rich and diversified, reflecting the great range of climate, topography, and soils and the varying effects of human habitation.

Forest categories

The forests of Vietnam can be divided into two broad categories: evergreen forests, which include conifers, and deciduous forests. There are more than 1,500 species of woody plants in Vietnam, ranging from hardwoods such as ebony and teak to palms, mangroves, and bamboos. There also are numerous species of woody vines (lianas) and herbaceous plants. In the aggregate, the dense and open forests, savannas, brushland, and bamboo cover approximately half of the total area of Vietnam.

In most areas the forests are mixed, containing a great variety of species within a given area. Rain forests are relatively limited, and pure stands are few. The nearest to pure forest types are the pines—the three-needled *Pinus khasya* and the two-needled *P. merkusii* found in the uplands—and the mangrove forests of the coastal areas. In the mountainous regions are subtropical species from such genuses as *Quercus, Castanopsis, Pinus,* and *Podocarpus.* Brushwood, bamboo, weeds, and tall grasses invade logged areas and grow around settlements and along arterial highways and railroads. Between the logged areas and the upland forests are other mixtures of forest types.

A large part of the forest in the central highlands is dense and rich in broad-leaved evergreens and semievergreens, some of which produce valuable timbers. Some of this region still is composed of undisturbed (primary) forests. Other types of forests there include secondary forests; open forests, which typically have trees of the Dipterocarpaceae family and species from the genus *Lagerstroemia* (crape myrtle); mangrove forests; and barren lands of sand dunes with eucalyptus and small, thorny deciduous trees and species from the *Casuarina* genus of flowering plants. Cogon grass (*Imperata cylindrica*) is commonly found in the open forests, and savannas occupy large areas formerly covered by forests. Grass and sedge swamps are characteristic of the Thap Muoi Plain (Plain of Reeds), a depression in the Mekong River delta.

During the Vietnam War, herbicides were used by the U.S. Army to defoliate large areas of forest in southern Vietnam. Most of these forests have been regenerating, however, and resettlement programs and illegal logging appear to have created longer-lasting damage.

Animal life. The most common domesticated animals in Vietnam are water buffalo, cattle, dogs, cats, pigs, goats, ducks, and chickens. Wild game in the central highlands includes elephants and tapirs; rhinoceroses once roamed there, but none have been seen since the early 1940s. Also found in the forests are large cats, including tigers, leopards, and ounces (snow leopards); several kinds of wild oxen, including gaurs and koupreys; and various types of bears, among them black bears and sun bears (honey bears). Deer are plentiful and include the small musk deer and barking deer. Other common wild animals are wild boars, porcupines, jackals, otters, mongooses, hares, skunks, and squirrels, including flying squirrels.

There are many different kinds of small wildcats and three types of civets—Malagasy civets, binturongs, and palm civets. Primates such as the langur, macaque, gibbon, and rhesus monkey live in the forests. Crocodiles are found on the edges of some lakes and along riverbanks; other reptiles include several kinds of lizards, pythons, and cobras. Of the wide variety of land and water birds, some 600 species have been identified in southern Vietnam alone.

Traditional regions. Diverse cultural traditions, geographic variations, and historical events have created distinct traditional regions within the country. The general topographic dichotomy of highland and lowland regions also has ethnolinguistic significance: the lowlands generally have been occupied by ethnic Vietnamese, while the highlands have been the home of numerous smaller ethnic groups that differ culturally and linguistically from the Vietnamese. The highland peoples can be divided into the northern ethnic groups, with affinities to peoples in southern China, and the southern highland populations, with ties to the Mon-Khmer and Austronesian peoples of Cambodia, Indonesia, and elsewhere in Southeast Asia. A north-south variation also evolved among the ethnic Vietnamese as they expanded southward from the Red River delta along the coastal plain and into the Mekong River delta. After the mid-19th century, Vietnam was divided by the French into Tonkin in the north, Annam in the centre, and Cochinchina in the south. The Vietnamese themselves have long made a distinction between the northern region, with Hanoi as its cultural centre; the central region, with the traditional royal capital of Hue; and the southern region, with Saigon (Ho Chi Minh City) as its urban centre.

Highland and lowland dichotomy

A settlement (background) overlooking rice paddies near Hoa Binh, northern Vietnam.

Settlement patterns. There are several distinct rural settlement patterns in Vietnam. Especially in northern and central Vietnam, geomantic principles influenced the traditional internal orientation of houses and community buildings; in central Vietnam, buildings often faced the sea. In the densely populated Red River delta, villages often are tightly nucleated settlements, usually enclosed by a bamboo hedge or an earthen wall. Those along rivers, canals, or roads often abut each other, forming a single elongated settlement. Lowland Vietnamese villages on the central coastal plain are characteristically close-knit, small clusters of farmsteads near watercourses. Fishing villages often are situated in sheltered inlets. In the Mekong delta many settlements are strung out along waterways and roads; most are loose-knit clusters of farmsteads, with some farmsteads scattered about the rice fields. The pattern of settlements of the Cham and Khmer minorities closely resembles that of the Vietnamese. Most highland peoples build their houses on pilings.

Vietnam's traditional major cities are Hanoi, Hue, and Saigon (Ho Chi Minh City). Throughout Vietnamese his-

tory the Hanoi area has been important and was the site of several early capitals. Hanoi also served as the French capital of Indochina from 1902 until 1954, and the city retains the architecture of that heritage. The city's port of Haiphong was developed by the French in the late 19th century as a trade and banking centre. Hue was the seat of the Nguyen family, which controlled central and southern Vietnam from the late 17th to the late 19th century. Located on the Huong (Perfume) River, it was laid out in the early 19th century as a political and religious centre, and its economic functions were ancillary. Saigon was built largely by the French in the second half of the 19th century as the administrative capital and principal port of Cochinchina. The city's architecture recalls towns and cities in southern France. The adjoining city of Cholon long has been a major centre for ethnic Chinese.

The people. *Ethnolinguistic groups.* Vietnam has one of the most complex ethnolinguistic patterns in Asia. The Vietnamese were significantly Sinicized during a millennium of Chinese rule. Vietnamese, one of the Mon-Khmer languages of the Austro-Asiatic language family, exhibits strong Chinese influence.

The Cham

Indian influence is found among the Cham and Khmer minorities. The Cham, whose language belongs to the Austronesian language family, formed the majority population in the Indianized kingdom of Champa in what is now central Vietnam from the 2nd century to the late 15th century AD. Small numbers of Cham remain in the south-central coastal plain and in the Mekong delta near the Cambodian border. The Khmer (Cambodians), whose language is one of the Mon-Khmer languages, are scattered throughout the Mekong delta.

Many other ethnic groups inhabit the highlands. While cultures vary considerably in the central highlands, shared characteristics include a traditional way of life still largely oriented around kin groups and small communities. Known collectively by the French as Montagnards ("Highlanders"), these peoples have affinities with other Southeast Asians. Many groups—such as the Rade (Rhade), Jarai, Chru, and Roglai—speak Austronesian languages, linking them to the Cham, Malay, and Indonesian peoples; others—including the Bru, Pacoh, Katu, Cua, Hre, Rengao, Sedang, Bahnar, Mnong, Mang (Maa), and Stieng—speak Mon-Khmer languages, affiliating them with the Khmer. Highlanders have experienced little Chinese or Indian influence, but they were exposed to Western (French and then American) influence from the late 19th century until the early 1970s. French missionaries and administrators provided roman script for some of the Montagnard languages, and additional orthographies have been devised since. The Montagnards have exhibited an intense desire to preserve their own cultural identities.

The various groups in the uplands of northern Vietnam have ethnolinguistic affiliations with peoples in Thailand, Laos, and southern China. The largest of these are the tribal Tai (Thai) groups who speak Tai languages and generally live in upland valleys. Hmong (Miao, or Meo) and Mien groups, who speak languages of the Sino-Tibetan language family, are scattered at higher elevations.

Religions. Confucianism, Taoism, and Mahāyāna Buddhism flowed into Vietnam over many centuries. Gradually they became intertwined, simplified, and Vietnamized to constitute, along with vestiges of earlier animistic beliefs, a Vietnamese folk religion that came to be shared to some considerable extent by all Vietnamese, regardless of region or social class. Animistic beliefs are held by many tribal peoples. During the 1920s the syncretic religion of Cao Dai appeared, and in the 1930s the Hoa Hao neo-Buddhist sect spread through parts of the Mekong delta.

Roman Catholicism was introduced into Vietnam in the 16th century and spread rapidly following the French conquest in the mid-19th century. The heaviest concentrations of Roman Catholics in Vietnam once were in the north, but many fled to the south after the partition of the country in 1954. Protestantism came to Vietnam in 1911 and spread mainly among small segments of the urban population in the central and southern regions.

In 1954 all foreign Roman Catholic clergy were expelled from North Vietnam, leaving only native priests. The North Vietnamese government tried to supplant organized religion with its own patriotic Buddhist, Cao Dai, Catholic, and Protestant religious organizations; Catholic clergy and membership renounced their allegiance to Rome. With the conquest of South Vietnam by North Vietnam, all foreign Christian clergy were expelled. The country's current constitution has guaranteed freedom of religion, though in practice government controls have been relaxed only gradually.

Demographic trends. Vietnam's population has grown rapidly since reunification in 1975. As a result, an increasing proportion of the population is young.

Migration pattern

The migration pattern long has been predominantly from north to south, and more recently there also has been migration from the lowlands to higher elevations and from rural to urban areas. In 1954 nearly one million people moved from north to south. In both the north and the south in the late 1950s, there were programs to resettle ethnic Vietnamese from the lowlands to the uplands. While these programs were discontinued in the south in 1963, they continued in the north; between 1976 and 1980 they were revived throughout the country and greatly intensified, with a significant number of people moving from the south to the central highlands. Since then, however, there has been an overall flow of migrants into Ho Chi Minh City and its environs, as well as into the central highlands. Out-migration has been greatest in parts of the northeast and along the central coastal plain.

Emigration also has been considerable since reunification. Between 1975 and 1990 hundreds of thousands of Vietnamese left the country, both legally and illegally, and an unknown number died at sea. Many have remained in refugee camps in Thailand and other countries, but a large number have emigrated, especially to the United States.

The economy. Vietnam's greatest economic resource is its literate and energetic population. Its long coastline provides excellent harbours, access to marine resources, and many attractive beaches and areas of scenic beauty that are well suited to the development of tourism; a lack of infrastructure, however, has inhibited full utilization of these assets. The actual potential for economic growth based on Vietnam's wealth of natural resources, however, is being rendered increasingly problematic by population growth, environmental degradation, and rising domestic demand, and the country remains one of the poorest in the world.

During the period of 1954–75, when the country was divided, there were three layers to the Vietnamese economy: a bottom layer based on the cultivation of rice, a middle layer dominated by mining in the north and rubber plantations in the south, and a third layer that was a wartime creation marked by large-scale Soviet and Chinese aid in the north and substantial American aid in the south. In the north, land reform in 1955–56 was followed by rapid collectivization of agriculture and handicrafts. Government investment favoured heavy industry at the expense of agriculture, handicrafts, and light industry, the traditional mainstays of the economy. Heavy industry grew, but efficiency was low, quality was poor, and further progress was hampered by deficiencies in agriculture and light industry. Economic aid from socialist countries masked many economic deficiencies. The southern economy was largely based on free enterprise, with significant state ownership of industrial enterprises. Agriculture flourished in the Mekong delta, while trade and transport were developed by private enterprise. The standard of living was significantly higher in the south than it was in the north.

After reunification, the northern model of development was imposed on the entire country. Efforts to socialize the commercial sector and to collectivize agriculture met with resistance, especially in urban centres and in the rich Mekong delta, where the majority of farmers in the 1970s were self-sufficient, middle-income peasants. The south also experienced a severe loss of human resources. Many well-educated people fled Vietnam after 1975. Hundreds of thousands more, mainly those associated with the former government or the Americans, were placed in jails or reeducation centres, while other skilled but politically suspect people were forced to resettle in remote areas. Efforts to abolish private enterprise in the south and deteriorating

Population loss in the south

political relations with China mainly affected the ethnic Chinese and precipitated a flight of ethnic Chinese from Vietnam in 1978. Large police and military expenditures further strained the budget and diverted resources from productive enterprises.

These factors, combined with poor management of state-run programs, precipitated a severe economic crisis. Food production and per capita income dropped, and consumer goods were shoddy, expensive, and in short supply. The government responded with minor reforms in 1979 and more basic changes beginning in 1986. Vietnam began to move away from a state-controlled, centrally planned, subsidized economy toward one that utilized market forces and incentives and tolerated private enterprise—albeit under continuing government control. In response, the quality and variety of food and of various consumer goods increased, as did exports.

Resources. Mineral deposits, mainly in the north, are diverse. There are large reserves of anthracite coal, as well as of phosphates, high-grade chromite, tin, antimony, bauxite, gold, iron ore, lead, tungsten, zinc, and lime. A number of offshore oil deposits have been discovered in the South China Sea, mainly off Vietnam's southern coast.

Agriculture, forestry, and fishing. Agriculture is by far the most important economic sector in Vietnam. The great majority of the population earns its income from farming. In addition, agriculture is the main source of raw materials for the processing industries and a major contributor to exports; by the late 1980s Vietnam was again exporting rice after years of shortages. Permanent cultivation covers large areas of the country's lowlands and smaller portions of the highlands. The primary agricultural areas are the Red River delta, the Mekong River delta, and the southern terrace region. The central coastal land, which is subject to destructive typhoons, is a region of low productivity. The central highlands area, traditionally one of low productivity, has been intensively cultivated since 1975, but with mixed results.

Rice is the most important crop. It is grown on about four-fifths of the cropped land, principally in the Red River and Mekong River deltas. Other major food crops are cassava (manioc), corn (maize), soybeans, peanuts (groundnuts), and sweet potatoes. Agriculture is highly labour-intensive in Vietnam, and much plowing is still done by water buffalo. There are many plantations of banana and other fruit trees, coconut, and sugarcane, most of them found in the Mekong River delta and the southern terrace regions. Coffee and tea are grown in the central highlands. The production of rubber was disrupted by the war but has been restored in the central highlands and southern terrace regions. Other cash crops include tobacco and jute. Fields, groves, and kitchen gardens throughout Vietnam include a wide variety of fruit trees (banana, orange, mango, jackfruit, and coconut) and vegetables. Kapok trees are found in many villages, and the Vietnamese cultivate areca palms and betel peppers for their nuts and leaves and mulberry bushes to feed silkworms.

Seafood export

The export of such seafood as shrimp, squid, crab, and lobster has become a growing source of foreign exchange. There also has been an increase in the number of commercial shrimp farms. The most important freshwater fisheries are located on the plains of the Mekong and Bassac rivers.

Forestry is a major industry. Charcoal production is widespread, and a number of factories produce furniture, pulp, and paper. Plywood, lumber, and rattan products also contribute to the economy. Deforestation and soil degradation, however, threaten the viability of the industry, especially because of increasing domestic demand for forest products.

Industry. Following the reunification of the country in 1975, a concerted effort was made to rapidly transform the private, capitalist industry in the south into a state-run sector. Many industrial operations there were nationalized or forced to become joint state-private enterprises. For industry as a whole, the productivity of both capital and labour declined, and gross output slumped. Heavy industry—plagued by waste and inefficiency, lack of spare parts and raw materials, energy shortages, and poor quality control—led the decline.

Reform measures in the 1980s included introducing incentives, reducing subsidies to inefficient state-run operations, and gradually allowing limited market mechanisms. Light industry registered significant gains, while heavy industry responded more sluggishly but showed some improvement. Private enterprise and collectives grew somewhat at the expense of the state sector.

Mining has remained important, especially in the north, although not to the extent it once was. Coal, especially anthracite, has long been an important export. Phosphate, iron, tin, antimony, and chromium are produced for domestic industry and for export. Gold is used to make jewelry. Manganese, bauxite, lead, tungsten, zinc, and lime also are mined in significant quantities. The fledgling petroleum industry has grown steadily since oil extraction began in 1986.

Food processing is the largest industrial activity in Vietnam. Seafood is processed for export, while coffee and tea are processed both for export and for domestic consumption. Beverages and a variety of condiments also are produced in significant quantities. Textiles are of increasing importance; silk production revived in the 1990s after a period of decline.

Vietnam long has been a major producer of cement. The chemical industry has been growing, with fertilizer being its most important product. Steel is a major part of Vietnam's heavy industry. Rubber is processed for export and is used in domestic production, mainly to make bicycle tires and tubes but also in the manufacture of a wide range of other goods. Other important industrial products include bicycles, machine tools, electrical equipment, celluloid and paper, and leather goods. Electric power generation has increased significantly since 1980, with much of the growth coming from the development of hydroelectricity.

Finance. In the north until 1975 and throughout Vietnam thereafter, the state-owned National Bank of Vietnam (renamed the State Bank of Vietnam) functioned as a government monopoly in the banking sector. Commercial banking facilities were virtually nonexistent. Following economic reforms in the late 1980s, however, this structure was inadequate to attract badly needed foreign trade and investment. An import-export bank was established in 1989 to promote investment and to facilitate trade transactions. As foreign investment gradually increased in the early 1990s, some foreign commercial banks were allowed to establish branch offices in Vietnam, which greatly expanded the scope of banking services available.

Banking reforms

Trade. Both parts of Vietnam experienced trade deficits during the war, and deficits continued after reunification. A trade embargo imposed by the Americans exacerbated problems of low efficiency and poor quality control that hampered exports. In the first decade after reunification, the value of exports was only one-third that of imports. The Soviet Union and the communist countries of eastern Europe came to be Vietnam's most important trading partners.

Vietnam's efforts to increase trade with capitalist countries as part of its larger program of economic reforms took on added urgency with the breakup of the Soviet Union and the demise of the communist governments in eastern Europe in the late 1980s and early 1990s, because trade with these areas was drastically reduced. Subsequently, such countries as Japan, Singapore, and Thailand became major trading partners. Exports increased, and the trade deficit narrowed.

Mineral fuels and lubricants, motor vehicles, machinery, and foodstuffs account for most of Vietnam's imports. Exports consist mainly of primary commodities (*e.g.*, rubber, coal, forest products, and coffee), handicrafts, and such light manufactures as textiles and footwear. In addition, there has been a significant rise in the export of processed seafood and petroleum.

Transportation. The topography of Vietnam renders land transportation between the north and the south difficult, with traffic limited to the narrow coastal corridor. Hanoi and Ho Chi Minh City are connected by rail and highway through this corridor. The nation's road network is extensive but in generally poor condition. The two large

deltas, where most of the population is concentrated, rely heavily on a vast network of navigable rivers and canals.

Ho Chi Minh City and Hanoi have international airports. In addition, a number of smaller cities are connected by domestic air routes. Vietnam's major ports are at Haiphong in the north and Ho Chi Minh City in the south, followed by Da Nang in central Vietnam. There are several other good ports, including Cam Ranh, a superb natural harbour developed extensively by the Americans during the war.

Administration and social conditions. *Government.* The first constitution of the Socialist Republic of Vietnam was adopted in 1980; it was superceded by a second constitution, promulgated in 1992. In addition to reforming Vietnam's government and political structure, the 1992 constitution also outlined major shifts in foreign policy and economic doctrine. In particular, it stressed the development of all economic sectors, including private enterprise, and it granted foreign investors the right to legal ownership of their capital and assets while guaranteeing that their property could not be nationalized by the state.

The 1992 constitution

A unicameral, popularly elected National Assembly is the supreme organ of the government. It elects the president, who is head of state, and the vice president. The cabinet consists of the prime minister, who is nominated by the president and approved by the National Assembly, and deputy prime ministers and the heads of government ministries and various state organizations, who are named by the prime minister and confirmed by the Assembly. The cabinet coordinates and directs the ministries and various state organizations of the central government and supervises the administrative committees at the local government level.

The responsibilities of the ministries usually are divided along narrow functional lines; there are, for example, numerous economic ministries concerned with agriculture and the food industry, marine products, forestry, and water conservancy. Larger ministries tend to be relatively self-sufficient, with their own colleges, training institutions, and health, social, and cultural facilities. There also are several commissions under the cabinet, such as the State Planning Commission. The prime minister's office oversees a number of general departments beneath the ministerial level and committees that are formed to supervise major projects which involve more than one ministry.

The country is divided administratively into 50 provinces and 3 municipalities (Hanoi, Haiphong, and Ho Chi Minh City). These are further subdivided into about 500 districts. At the provincial and district levels, the highest government authority is an elected People's Council, the actual work of which is carried out by administrative committees elected by the councils. Village administration is represented by village People's Councils.

Both the 1980 and 1992 constitutions institutionalized the Vietnamese Communist Party as the sole source of leadership for the state and society. The 1992 document, however, delegated much more authority to the president and to the cabinet (which superceded the earlier Council of Ministers); they were given the task of running the government, while the party became responsible for overall policy decisions. These changes reduced considerably the role of the party. Notably affected were the Politboro and the larger Central Committee—which previously had been the major decision-making bodies of both the party and the state—and the Secretariat and its presiding general secretary—which, in their role of operating the party organization and carrying out the resolutions of the Central Committee and the Politboro, had effectively governed the country.

Popular associations

Nonetheless, the party remains the dominant political institution within Vietnam. Numerous popular associations disseminate party policies and serve as training grounds for potential party members. The Vietnamese Women's Union is an important and active organization. The Ho Chi Minh Communist Youth Union is largely responsible for the Vietnam Youth Federation, while local party units and agricultural cooperative organizations assume leadership over the Farmers' Federation. The Vietnam Federation of Trade Unions has the responsibility of safeguarding workers' welfare, but it does not function as a Western-style bargaining unit.

Justice. The judicial system consists of the courts and the People's Organs of Control. The National Assembly supervises the work of the Supreme People's Court, which is the highest court of appeal and the court of first instance for special cases (such as treason). This court, in turn, supervises the judicial work of local People's Courts, which are responsible to their corresponding People's Councils. The People's Courts function at all levels of government except the village, where the village administrative committee functions as a primary court.

The People's Organs of Control act as watchdogs for the state: they monitor the performance of government agencies, maintain vast powers of surveillance, and act as prosecutors before the People's Courts. The Supreme People's Organ of Control is responsible only to the Standing Committee of the National Assembly.

Armed forces. Military forces include the army, paramilitary regional and provincial forces, the militia, and the reserves. There are separate military commands in Hanoi, Haiphong, and Ho Chi Minh City. Vietnam has maintained a proportionally large military force.

Education. The Vietnamese, with their Confucian traditions, have always placed great importance on education. Rural education in the south was badly disrupted during the war years, and all religious and private schools were nationalized after 1975. The government subsequently pursued a policy of education reform. Nine years of schooling are mandatory and are divided into five years of primary and four years of lower-secondary school. Continuing students are enrolled either in an academic or a vocational upper-secondary program, which lasts three years. Opportunities for advanced education are limited. The University of Hanoi, founded originally by the French and refounded in 1956, is the country's oldest institute of higher education.

Literacy rates are high. Emphasis is placed on training in science and technology, although a lack of equipment hinders the program. Several thousand students are sent abroad each year to study languages and technology. While most students once went to the Soviet Union and the countries of eastern Europe, increasing numbers are now studying in Western countries (including the United States) or in Japan.

Health and welfare. Before reunification, health services were underdeveloped in the rural areas of the south but were well-developed in the north. After 1975 there was a general increase in health facilities and personnel. The health care system is one of the socialist state's greatest achievements; like all other programs in Vietnam, however, it has been severely hampered by a lack of funds since the late 1970s.

Cultural life. Chinese influence permeated all aspects of traditional Vietnamese culture, while Western influences have been strong in the 20th century.

Daily life. Vietnam's Confucian heritage is seen in the importance of family to the Vietnamese. Families are essentially patrilineal, but Vietnamese women work alongside men in many jobs and play a major role in raising children and managing family finances. When possible, the Vietnamese prefer to work from early morning until early evening, with an extended rest period in the heat of midday. In rural areas, both men and women wear trousers and shirts or blouses. On formal occasions and in urban areas, Western-style clothing is common, including skirts and blouses for women. Women still sometimes wear a form of the traditional *ao dai*, a long, slit tunic worn over pants.

Cuisine

Rice is the staple food. Vietnamese cuisine incorporates elements of both Chinese cooking and the cuisines of other Southeast Asian countries. Noodle soup with chicken or beef broth (*pho*), a distinctive kind of spring roll (*cha gio*), and the use of fermented fish sauce (*nuoc mam*) for dipping and seasoning are among the many noteworthy dishes.

The arts. Early Vietnamese poetry was written exlusively in Chinese until the end of the 13th century. By the 15th century, however, a demotic script called *chu nom*

("southern writing") had evolved into a vehicle for writing in vernacular Vietnamese. The Chinese heritage of the elite merged with local oral tradition, producing a truly national literature. A distinctly Vietnamese long narrative poem in verse developed, culminating in the masterpiece of Vietnamese literature, *Kim Van Kieu* (*The Tale of Kieu*), by Nguyen Du (1765–1820). In the 20th century, Vietnamese literature came to be written in a romanized script. In the 1930s a modern Vietnamese literature developed under French influence, featuring poetry, novels, and short stories. Between 1954 and 1975 a cosmopolitan literature stressing creativity and individual freedom flourished in the south, while a state-sponsored literature of Socialist Realism was promoted in the north. After 1975 Socialist Realism became a national orthodoxy, although in the 1980s literature became more lively and diverse in content.

Under communist rule the theatre has been strictly controlled, and all professional performers and other technical staff have become employees of the state. The indigenous *cai luong*, a satirical musical comedy genre that emerged in the south in the early 20th century, is still enormously popular, as are modern plays. There also are theatrical troupes specializing in traditional Chinese opera (called *hat tuong* in the north and *hat boi* in the south), traditional popular operettas (*hat cheo*) of indigenous origin, distinctly Vietnamese water puppetry (*mua roi nuoc*)—in which performances take place on a pool or pond, and water activates the puppets and hides the manipulating apparatus—and circus performances.

Painting has developed slowly and unevenly, bound first by traditional Chinese forms, then by a style imitative of French Impressionism, and more recently by Socialist Realism. High-quality lacquerware, however, continues to be produced. Folk arts persist among the peoples of the central highlands. Women weave blankets and clothing, while men weave baskets and mats. Gongs are the most common of a variety of musical instruments. Crossbows and figures are carved from hardwoods. The Cham and Khmer minorities retain some folk arts, but their traditions seem to be fading.

Sporadic early efforts to develop a film industry in Vietnam have met with little success. Prior to 1975, a small number of undistinguished films were produced in both the north and the south, while the north made a few fine documentaries. Despite continuing financial constraints and technical deficiencies, higher-quality feature films began to appear in the 1980s.

Cultural institutions. Vietnam abounds with a variety of historical sites. Hanoi contains the 11th-century Temple of Literature, the One Pillar Pagoda, and many other ancient sites, as well as the Vietnam History Museum, the National Art Gallery, and the National Library. Its recent past is amply illustrated in the Vietnam Revolution Museum, the People's Army Museum, and a large complex that includes Ho Chi Minh's mausoleum, the house he lived in as president, and the Ho Chi Minh Museum.

Hue

Hue and its environs contain the royal citadel of the last dynasty and numerous royal mausoleums and tombs, as well as many Buddhist pagodas. Ho Chi Minh City has a noteworthy zoo and botanical garden on the edge of the downtown area.

Recreation. Soccer (association football) is exceedingly popular in Vietnam, and volleyball, badminton, wrestling, bicycling, chess, and dominoes are also widely enjoyed. Urban Vietnamese stroll in great numbers on evenings and weekends, especially in the parks and along the banks of lakes and rivers in Hanoi and Ho Chi Minh City. In the larger cities, some young people enjoy Western dancing and listening to Western and modern Vietnamese music in coffeehouses.

Press and broadcasting. Radio, television, and some newspapers and journals are owned and operated by the state. The publishing of newspapers, magazines, and books is regulated by the government, but the strict controls of earlier years were somewhat relaxed during the 1980s. The circulation of many books published in the south between 1954 and 1975, however, is still forbidden.

(G.C.H./N.L.J.)

For statistical data on the land and people of Vietnam, see the *Britannica World Data* section in the BRITANNICA BOOK OF THE YEAR.

HISTORY

Origins of the Vietnamese people. Relatively little is known about the origins of the Vietnamese. They first appeared in history as the so-called "Lac" peoples, who lived in the Red River delta region, in what is now northern Vietnam. Some scholars have suggested that the Lac were closely related to other peoples, known as the Viet (called the Yüeh by the Chinese), who inhabited the coastal region of East Asia from the Yangtze River to the Red River delta during the 1st millennium BC. Others have expressed doubt about this supposition, noting that modern-day Vietnamese share many cultural and linguistic traits with other non-Chinese peoples living in neighbouring areas of Southeast Asia. It is now generally believed that the Lac peoples were the result of a mixture between Australo-Melanesian inhabitants who had lived in the area since Paleolithic times and Asiatic peoples who later migrated into the area from China.

Linguistic research, which offers a relatively reliable way of distinguishing the various ethnic groups of Southeast Asia, supports the mixed ethnic and cultural origin of the Vietnamese people. Although the Vietnamese language is distinct, it nevertheless can be described as a fusion of Mon-Khmer, Tai, and Chinese elements. From the monotonic Mon-Khmer language family, Vietnamese derived many of its basic words; from the Tai languages, it took tonality and a number of grammatical elements; and from the Chinese, who at that time were somewhat more culturally advanced than the peoples of the Red River delta, it acquired not only a script but also most of its political, literary, philosophical, and technical vocabulary.

Ethnographic study also reveals the degree to which ancient Vietnamese culture was a composite of elements found among many other peoples within the region. Totemism, animism, tattooing, the chewing of betel nuts, teeth blackening, and many marriage rituals and seasonal festivals indicate the relationship between the Vietnamese and the neighbouring peoples in Southeast Asia. Although Chinese civilization later became the main force in shaping Vietnamese culture, the failure of the Chinese to assimilate the Vietnamese people underscores the fact that strong elements of an authentic local culture must have emerged in the Red River valley long before China established its millennium of rule over Vietnam.

Earliest known history of Vietnam. *Legendary kingdoms.* According to the most authoritative legends, the history of the Vietnamese people begins with King De Minh, a descendant of a divine Chinese ruler who was also the legendary father of Chinese agriculture. De Minh and an immortal fairy of the mountains produced Kinh Duong, ruler of the Land of Red Demons, who married the daughter of the Dragon Lord of the Sea. Their son, Lac Long Quan ("Dragon Lord of Lac"), is regarded as the first authentic Vietnamese king. To make peace with the Chinese, Lac Long Quan married Au Co, a Chinese immortal, who bore him 100 eggs, from which sprang 100 sons. Later, the king and queen separated; Au Co moved with 50 of her sons into the mountains, and Lac Long Quan kept the other 50 sons and continued to rule over the lowlands. Lac Long Quan's eldest son succeeded him as the first of the Hung (or Hong Bang) kings (*vuong*), and he is regarded as the real founder of the Vietnamese nation and of the first Vietnamese dynasty.

Lac Long Quan

This legend and other related legends, most of which received their literary form only after AD 1200, describe in mythical terms the fusion, conflicts, and separation of peoples from the north and south and of peoples from the mountains and the coastal lowlands. The legends show the immortals as mountain dwellers, while the people along the coast are represented by the dragon lords—a division found in many legends throughout Southeast Asia. The retreat of Au Co and 50 of her sons into the mountains may well be a mythical record of a separation among the proto-Vietnamese in the Red River delta: those who left the lowlands could be the ancestors of the Muong, who

still live in the hills surrounding the delta and who are the only ethnic minority of Vietnam closely related in language and customs to the Vietnamese.

According to legend, the Hung dynasty had 18 kings, each of whom ruled for about 150 years. Their country, called Van Lang ("Land of the Tattooed Men"), is said to have included not only the Red River delta but also much of southern China. The last of the Hung kings was overthrown in 258 or 257 BC by a neighbouring warlord, Thuc Phan, who invaded and conquered Van Lang, united it with his kingdom, and called the new state Au Lac, which he then ruled under the name An Duong. Au Lac existed only until 207 BC, when it was incorporated by a former Chinese general, Trieu Da (Chao T'o in Chinese), into the kingdom of Nam Viet (Nan Yüeh in Chinese).

Nam Viet. This kingdom covered much of southern China and was ruled by Trieu Da from his capital near the present site of Canton. Its population consisted chiefly of the Viet who had earlier been driven by the Chinese from their kingdoms south of the Yangtze River. Trieu Da, after throwing off Chinese sovereignty and killing all officials loyal to the Chinese emperor, adopted the customs of the Viet and made himself the ruler of a vast non-Chinese empire. After it had incorporated Au Lac, Nam Viet included not only the Red River delta but also the coastal lands as far south as modern-day Da Nang. The end of Au Lac in 207 BC marks the end of legendary history and the beginning of Vietnamese history, as recorded in Chinese historical annals.

After almost 100 years of diplomatic and military duels between the Han Chinese empire and Trieu Da and his successors, Nam Viet was conquered (111 BC) by the Chinese under the Han emperor Wu-ti. Thus, the territories occupied by the ancestors of the Vietnamese fell under Chinese rule. Nam Viet became the Chinese province Giao Chi (later Giao Chau), which was divided into nine military districts. The three southernmost of these covered the northern half of what is now Vietnam.

Chinese rule

Early society. When China extended its rule over Vietnam, the people of the Red River delta were in transition from the Bronze to the Iron Age, although some stone implements were also still in use. These ancestors of the Vietnamese were already experienced at cultivating rice. They had learned how to irrigate their rice fields by using the tides that backed up the rivers. Plows and water buffalo were still unknown (the land was prepared for cultivation with polished stone hoes), but the proto-Vietnamese are thought to have been able to produce two rice crops annually. They supplemented their diet by fishing and hunting. Their weapons were mainly bows and arrows; the bronze heads of their arrows often were dipped in poison to facilitate killing such larger animals as elephants, whose tusks were traded for iron from China.

The social organization of the early Vietnamese, before Chinese rule, was hierarchical, forming a kind of feudal society that until the mid-20th century existed among the Tai and Muong minority populations of northern Vietnam. Power was held by tribal chiefs at the head of one or several communities. These chiefs were civil, religious, and military leaders, and their power was hereditary; they were large landowners who kept the mass of the people in virtual serfdom. At the head of this aristocracy stood the king, probably the most powerful of the tribal chiefs.

Religion was characterized by the kind of animistic beliefs in supernatural beings and spirits that are common among preliterate agricultural and hunting peoples. Some of the spirits were those of dangerous animals, while others were of deceased important persons who needed to be propitiated. A great religious festival, almost a carnival, was held at the beginning of spring and was marked by abandon and promiscuity.

In all these respects, the inhabitants of the Red River delta, prior to their subjugation by the Chinese, showed numerous affinities with most of the people of mainland and island Southeast Asia. It was not until several centuries after the imposition of Chinese rule that the Vietnamese developed more distinct ethnic characteristics.

Vietnam under Chinese rule. The history of the Vietnamese people under more than a millennium of Chinese rule reveals an evolution toward national identity, which apparently came about as the result of three developments. The first of these was the introduction into the Red River delta of the more advanced civilization of China, including technical and administrative innovations and the more sophisticated level of Chinese learning, which made the Vietnamese the most advanced people of mainland Southeast Asia. The second was the efforts of the Chinese governors to achieve complete Sinicization through the imposition of Chinese culture, customs, and political institutions. The third and most significant development during this period was the resistance of the Vietnamese people to total assimilation and the use they made of the benefits derived from Chinese civilization in their struggle against Chinese political rule.

Soon after extending their domination over what is now northern Vietnam, the Chinese constructed roads, waterways, and harbours to facilitate communications within the region and to ensure that they maintained administrative and military control over it. They improved local agriculture by introducing better methods of irrigation and the use of metal plows and draft animals. They brought with them new tools and weapons, advanced the art of pottery, and used new mining techniques. For more than a century after annexing Nam Viet, however, the Chinese abstained from interfering with the local administration. In the Chinese province of Giao Chau, the hereditary lords exercised control over the peasant population, just as they had done while Giao Chau was a province of Nam Viet. Thus, although Vietnam was divided into military districts headed by Chinese governors, it remained, in fact, a leniently governed Chinese protectorate.

Chinese building programs

This form of government changed in the 1st century AD, when an energetic governor realized that the sway of the local Viet lords over the population was an obstacle to Sinicization. The desire to exploit the fertile Red River delta and its mountainous backcountry was certainly one reason why the expansionist Han dynasty wanted to hold on to Vietnam: there were vast forests and precious metals in the mountains, pearls in the sea, elephants with tusks of ivory, and a peasantry that could be taxed and recruited for forced labour. China's main interest in holding the Red River delta, however, was its value as an important stopover for ships engaged in the Han dynasty's nascent maritime trade with the East Indies, India, and even the Middle East. Vessels from many countries with which China developed commercial relations docked at the harbours of the Vietnamese coast, not only bringing new goods but also establishing contacts with a wider world and thus promoting the development of the country. In this process, which began early in the 1st century AD, economic, cultural, and political functions developed that the hereditary local lords were unfit to discharge—another reason why direct Chinese rule through the importation of an increasing number of Chinese officials became necessary.

As in all regions conquered by the Chinese Han dynasty (206 BC–AD 221, with a brief interruption in AD 8–23), efforts to set up direct Chinese rule were accompanied by a variety of attempts to transform the people of the Red River delta into Chinese. Local customs were suppressed, and Chinese customs, rites, and institutions were imposed by force. Taoist and Confucian teachings were pressed, together with instruction in the Chinese language; even Chinese clothing and hairstyles became obligatory. Many of these Chinese innovations were beneficial to the Vietnamese and were readily integrated into the indigenous local culture, but Sinicization never succeeded in reconciling the Vietnamese people, especially their leaders, with Chinese political domination. Not only the masses of the people but even the educated Vietnamese who knew Chinese and wrote only in Chinese held on to the local spoken language.

Attempts at Sinicization

The first major rebellion against Chinese rule broke out in AD 40, led by the noblewoman Trung Trac, whose husband, a tribal lord, had been executed by the Chinese. She and her sister, Trung Nhi, gathered together the tribal chiefs and their armed followers, attacked and overwhelmed the Chinese strongholds, and had them-

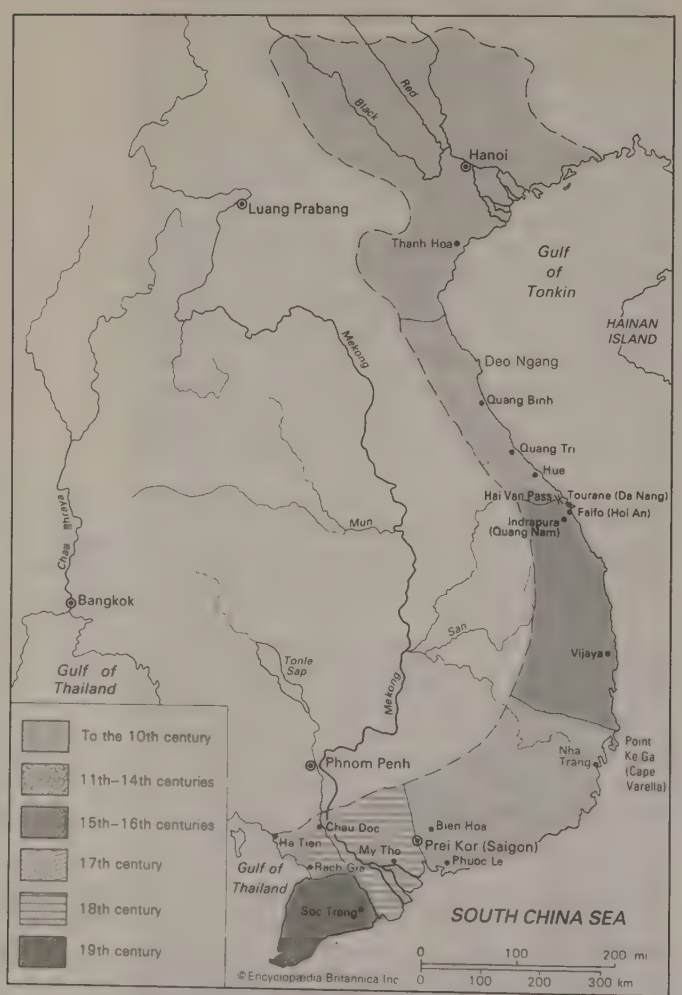
Vietnamese resistance

selves proclaimed queens of an independent Vietnamese kingdom. Three years later a powerful army sent by the Han emperor reestablished Chinese rule; the local aristocracy was deprived of all power, Vietnam was given a centralized Chinese administration, and Sinicization was resumed with increased intensity. The Trung sisters apparently were put to death by their conquerors.

Chinese rule, although challenged several more times, remained secure so long as China itself was effectively controlled by its own emperors. When the T'ang dynasty (618–907) fell into decay in the early 10th century, a series of uprisings broke out in Vietnam, which led in 939 to the restoration of Vietnamese independence.

The first period of independence. *The Ly dynasty.* Ngo Quyen, the Vietnamese commander who had defeated the Chinese in 939, became the first head of the new state of Vietnam. For more than a half century, however, independence brought neither peace nor political stability to Vietnam. In the early 11th century, Vietnam finally was brought together under a centralized administration by Ly Thai To, the founder of the Ly dynasty (sometimes called the Later Ly dynasty; 1009–1225). The Ly rulers established their capital at Hanoi, in the heart of the Red River delta, modernized the agricultural system, and replaced the divisive local lords with a system of state officials trained in a civil service institute set up on the Chinese model in 1076.

Although the new state, called Dai Viet, made considerable political, economic, and cultural progress, it soon encountered problems with its neighbour to the south, the Islāmic, Indianized state of Champa on the central coast. Dai Viet and Champa fought several wars in the 12th and 13th centuries. Dai Viet also clashed with the Khmer (Cambodian) state of Angkor, then the greatest power in mainland Southeast Asia.



Expansion of precolonial Vietnam.

The Tran dynasty. By then, the Ly dynasty was already in a state of decline. It was succeeded, after a period of civil strife, by a new dynasty called the Tran, which reigned from 1225 to 1400. For most of their rule, the Tran kings pursued the same policies that had made the country strong under the Ly; the Tran continued to clash with Champa, but they also were able to maintain several periods of peaceful coexistence. The primary challenge to Vietnamese independence, however, came from the north. The Yüan (Mongol) dynasty, which had come to power in China in 1279, sent armies estimated at more than 300,000 soldiers to restore the Red River delta to Chinese rule. The Tran resisted stubbornly and eventually were able to drive out the invaders. The general who commanded the Vietnamese forces, Tran Hung Dao, is still venerated as one of the great heroes of Vietnamese history.

The drain of these wars on Vietnam's resources, together with the declining vigour of its rulers, brought on a deep economic and social crisis and the overthrow of the Tran dynasty in 1400. The deposed Tran ruler appealed to China to help him regain the throne. China, by then ruled by the Ming dynasty (1368–1644), readily complied with the request, and China again invaded Vietnam in 1407. The Ming set up a direct Chinese administration, and these officials resumed the policies of assimilation begun by their imperial predecessors.

Chinese invasion of 1407

Expansion, division, and reunification. By the beginning of the 15th century, the cultural evolution of the Vietnamese people had reached a point at which any attempt to make them Chinese could only strengthen their nationalist sentiments and arouse their determination to throw off the Chinese yoke. Under the leadership of Le Loi, a wealthy landowner in the province of Thanh Hoa south of the Red River delta, a movement of national resistance started in 1418; after a 10-year struggle, the Chinese were forced to evacuate. Le Loi, who ascended the throne shortly thereafter under the name of Le Thai To, became the founder of the third great Vietnamese dynasty, the Later Le (sometimes simply referred to as the Le). Although the Later Le was not actually in power after 1600, it nominally headed the state until 1788.

The Later Le dynasty. Like the better rulers of the Ly and Tran dynasties, Le Thai To and some of his successors introduced many reforms. They gave Vietnam the most advanced legal code in Southeast Asia; promoted art, literature, and education; advanced agriculture; protected communal lands against the greed of large landowners; and even enforced a general redistribution of land among the entire population at the expense of the large landowners. The problem of the landless remained acute, however, because of population increases and the limited amount of available land in the north. The lack of land was one of the reasons the Le dynasty pursued a policy of territorial expansion, and it was a chief motive behind their efforts to drive the Chams from the small but fertile deltas to the south. Most of Champa was conquered in 1471 under the leadership of Le Thanh Tong (ruled 1460–97). Soldiers in the advancing Vietnamese army were settled in newly established villages south from the vicinity of Da Nang to the neighbourhood of Nha Trang, in what became the first great Vietnamese push into the south. The elimination of Champa was followed by incursions into the Cambodian territory of the Mekong delta, which the declining Khmer empire no longer was able to defend. Saigon became Vietnamese shortly before 1700, and the rest of the south followed during the next 60 years. With the exception of the southern province of Soc Trang, which was not annexed until 1840, Vietnam had reached its present size by 1757.

This extension of Vietnam to a length of some 1,000 miles altered the historical evolution of the state: up to that point, Vietnam's chief characteristic had been the existence of a strong central power at the head of a unified administration. The country subsequently was divided twice, and its partitioned governments were at war with each other for decades.

Two divisions of Vietnam. The first and shorter division of the country occurred soon after the elimination of Champa. The governor of Hanoi, Mac Dang Dung, made himself master of Vietnam in 1527. The deposed Le rulers

and the generals loyal to them regained control of the lands south of the Red River delta in 1545, but only after nearly 50 years of civil war could they reconquer Hanoi and the north.

Of much longer duration and greater historical significance was the second division of Vietnam, which occurred about 1620, when the noble Nguyen family, who had governed the country's growing southern provinces from Hue since 1558, rejected Hanoi's suzerainty. In Hanoi the Le monarchs were rulers in name only after the country was reunited following its first division; all real power was in the hands of the Trinh family, who had made themselves hereditary princes in charge of the government. For 50 years the Trinh rulers tried in vain to regain control of the southern half of the country by military means. The failure of their last campaign in 1673 was followed by a 100-year truce, during which both the Nguyen and the Trinh paid lip service to Vietnamese unity under the Le dynasty but maintained separate governments over the two halves of the country.

The Tay Son rebellion

National unity was reestablished only after a 30-year period of revolution, political chaos, and civil war (1772–1802). Although the revolution started in the south, it was directed against the ruling houses of both south and north. It was led by three brothers, whose name in history—Tay Son—was that of their native village. The Tay Sons overthrew the southern regime in 1777 and killed the ruling family. While the Tay Sons waged war against the north, one member of the southern royal family—Nguyen Anh, who had escaped the massacre—regained control of Saigon and the deep south in 1778, but he was driven out again by the Tay Sons in 1783. When the Tay Sons also defeated the Trinh in 1786 and occupied Hanoi, Vietnam was briefly reunited under Tay Son rule. In 1788 the Chinese tried to exploit the crisis in Vietnam, but the Tay Son rulers—who had abolished the Later Le dynasty—were able to defeat the Chinese invaders. During that same year, however, Nguyen Anh succeeded, with French military assistance, in occupying Saigon and the Mekong delta. In a series of campaigns that lasted 14 years, Nguyen Anh defeated the Tay Sons and gained control of the entire country. When Hue and Hanoi fell to his armies in 1802, he proclaimed himself emperor, under the name Gia Long, of a reunited Vietnam.

State and society of precolonial Vietnam. The rule of Gia Long and his successors until the conquest of Vietnam by France in the late 19th century brought no innovations in the organization of the state, the basic character of which already had been firmly established by the Ly emperors during the 11th century. The Ly had successfully fought the revival of a local feudalism, which was rooted in the powers exercised by the tribal chiefs before the coming of the Chinese. From the 11th century on, Vietnam remained a centralized state headed by a monarch whose absolute powers were said to derive from a mandate from heaven—one aspect of the thoroughly Confucian character of the Vietnamese state. The Ly established a fixed hierarchy of state officials that followed the Chinese model; it consisted of nine degrees of civil and military mandarins who were appointed by the emperor and were responsible to only him. All mandarins—those at the very top at the imperial court as well as those in the lowest ranks of the provincial and local administration—were recruited in only one way: through civil service examinations taken after years of study. As a rule, only the wealthy could spend the time required for these studies. Nevertheless, except in periods of dynastic decline when offices sometimes were for sale, the road to positions of power was through scholarship, not wealth.

The concept of a division of powers was alien to the precolonial rulers. The emperor, with the help of high court mandarins, was not only the supreme lawmaker and head of all civil and military institutions but also the dispenser of justice in both criminal and civil cases, and he delegated his powers to the hierarchy of mandarins in the provinces and villages. Even public functions of a religious character were the sole prerogative of the emperor and his representatives in the lower levels of the administration. No military caste ever exercised control over the state, no religious hierarchy existed outside the mandarins, and no aristocracy with political influence was allowed to arise. Titles of nobility, bestowed as honours, were not hereditary.

Economic policies

The economic policies of the great Vietnamese dynasties also favoured the maintenance of imperial and mandarin power. Through the 900 years of independence between Chinese domination and French colonial rule, the country's economy remained almost exclusively agricultural. Artisan and fishing villages existed, and there was some mining; but the mass of people were engaged in the cultivation of rice, and neither national nor international trade was systematically promoted. No property-owning middle class of merchants ever threatened the authority of the scholar mandarins, and the periodically rising power of great landowners was diminished from time to time through the redistribution of land. Gia Long and his successor, Minh Mang, actually abolished all huge landholdings during the first half of the 19th century. Theoretically, the emperor owned all the land, and it was by imperial decree that the settlers on newly conquered territories received their plots in the villages that sprang up south from the Red River delta to the Mekong delta.

Vietnam's rigid absolutism was limited to a certain extent by the Confucian concept that held the family to be the basic unit of civilized society; submission to the authority of the family head thus was the foremost moral obligation of every citizen. The autocratic character of society also was eased slightly by the limited authority granted to the village administration, whose purely local affairs were handled by a council of notables elected, as a rule, from the more prosperous or otherwise prominent citizens. Among the duties of these notables were the enforcement of law, the conscription of army and forced-labour recruits, and the assessment of taxes. Next to devotion to family, loyalty to the village was traditionally the first duty of every Vietnamese.

Western penetration into Vietnam. In 1516 Portuguese adventurers arriving by sea inaugurated the era of Western penetration into Vietnam. They were followed in 1527 by visiting Dominican missionaries, and eight years later a Portuguese port and trading centre was established at Faifo (modern Hoi An), south of present-day Da Nang. More Portuguese missionaries arrived later in the 16th century, and they were followed by other Europeans. The best-known of these was the French Jesuit missionary Alexandre de Rhodes, who completed a transcription of the Vietnamese language into roman script that later was adopted by modern Vietnamese as their official writing system, *quoc ngu* ("national language").

By the end of the 17th century, however, the two rival Vietnamese states had lost interest in maintaining relations with European countries; the only window left open to the West was at Faifo, where the Portuguese retained a trading mission. For decades the French had tried without success to retain some influence in the country. Only at the end of the 18th century was a missionary named Pigneau de Béhaine able to restore a French presence by assisting Nguyen Anh in wresting control of the country from the Tay Sons.

Vietnamese actions against the French

Upon becoming emperor, however, Nguyen Anh (now Gia Long) did not favour Christianity. Under his strongly anti-Western successor, Minh Mang (ruled 1820–41), all French advisers were dismissed, while seven French missionaries and an unknown number of Vietnamese Christians were executed. After 1840 French Roman Catholic interests openly demanded military intervention to prevent the persecution of missionaries. In 1847 the French took reprisals against Vietnam for expelling additional missionaries, but 10 years passed before Paris prepared a military expedition against Vietnam.

The conquest of Vietnam by France. The decision to invade Vietnam was made by Napoleon III in July 1857. It was the result not only of missionary propaganda but also, after 1850, of the upsurge of French capitalism, which generated the colonial concept of a need for overseas markets and the collateral request for a larger French share in Asian territories conquered by the West. The naval commander in East Asia, Rigault de Genouilly, long

an advocate of French military action against Vietnam, was ordered to attack the harbour and city of Tourane (modern Da Nang) and to turn it into a French military base. Genouilly arrived at Tourane in August 1858 with 14 vessels and 2,500 men; the French stormed the harbour defenses on September 1 and occupied the town a day later. Genouilly soon recognized, however, that he could make no further progress around Tourane and decided to attack Saigon. Leaving a small garrison behind to hold Tourane, he sailed southward in February 1859 and seized Saigon two weeks later.

Vietnamese resistance prevented the French from advancing beyond Saigon, and it took French troops, under new command, until 1861 to occupy the three adjacent provinces. The Vietnamese, unable to mount effective resistance to the invaders and their modern weapons, concluded a peace treaty with France in June 1862, which ceded the conquered territories to the latter. Five years later additional territories in the south were placed under French rule. The entire colony was named Cochinchina.

It had taken the French slightly more than eight years to make themselves masters of Cochinchina (a protectorate already had been imposed on Cambodia in 1863). It took them 16 more years to extend their control over the rest of the country. They made a first attempt to enter the Red River delta in 1873, after a French naval officer and explorer named Francis Garnier had shown, in a hazardous expedition, that the Mekong River could not serve as a trade route into southwestern China. Garnier had some support from the French governor of Cochinchina, but when he was killed in a battle with Chinese pirates near Hanoi, the attempt to conquer the north collapsed.

Within a decade, France had returned to the challenge. In April 1882, with the blessing of Paris, the administration at Saigon sent a force of 250 men to Hanoi under Captain Henri Rivière. When Rivière was killed in a skirmish, Paris moved to impose its rule by force over the entire Red River delta. In August 1883 the Vietnamese court signed a treaty that turned northern Vietnam (named Tonkin by the French) and central Vietnam (named Annam, based on an early Chinese name for the region) into French protectorates. Ten years later the French annexed Laos and added it to the so-called Indochinese Union, which the French created in 1887. The union consisted of the colony of Cochinchina and the four protectorates of Annam, Tonkin, Cambodia, and Laos.

The Indochinese Union

Colonial Vietnam. *French administration.* The French now moved to impose a Western-style administration on their colonial territories and to open them to economic exploitation. Under Governor-General Paul Doumer, who arrived in 1897, French rule was imposed directly on all levels of administration, leaving the Vietnamese bureaucracy without a trace of real power. Even Vietnamese emperors were deposed at will and replaced by others willing to serve the French. All important positions within the bureaucracy were staffed with officials imported from France; even in the 1930s, after several periods of reforms and concessions to local nationalist sentiment, Vietnamese officials were employed only in minor positions and at very low salaries, and the country was still administered along the lines laid down by Doumer.

Doumer's economic and social policies also determined, for the entire period of French rule, the development of French Indochina, as the colony became known in the 20th century. The railroads, highways, harbours, bridges, canals, and other public works built by the French were almost all started under Doumer, whose aim was a rapid and systematic exploitation for the benefit of France of Indochina's potential wealth; Vietnam was to become a source of valuable raw materials and a market for tariff-protected goods of French industries. The exploitation of natural resources for direct export was the chief purpose of all French investments, with rice, coal, rare minerals, and later also rubber as the main products. Doumer and his successors up to the eve of World War II were not interested in promoting industry, the development of which was limited to the production of goods for immediate local consumption. Among these industries—located chiefly at Saigon, Hanoi, and Haiphong—were breweries, distilleries, small sugar refineries, rice and paper mills, and glass and cement factories. The greatest industrial establishment was a textile factory at Nam Dinh, which employed more than 5,000 workers. The total number of workers employed by all industries and mines in Vietnam was 100,000 in 1930. Because the aim of all investments was not the systematic economic development of the colony but the attainment of immediate high returns for investors, only a small fraction of the profits was reinvested.

Effects of French colonial rule. Whatever economic progress Vietnam made under the French after 1900 benefited only the French and the small class of rich Vietnamese created by the colonial regime. The masses of the Vietnamese people were deprived of such benefits by the social policies inaugurated by Doumer and maintained even by his more liberal successors, such as Paul Beau (1902–07), Albert Sarraut (1911–14 and 1917–19), and Alexandre Varenne (1925–28). Through the construction of irrigation works, chiefly in the Mekong delta, the area of land devoted to rice cultivation quadrupled between 1880 and 1930. During the same period, however, the individual peasant's rice consumption decreased without the substitution of other foods. The new lands were not distributed among the landless and the peasants but were sold to the highest bidder or given away at nominal prices to Vietnamese collaborators and French speculators. These policies created a new class of Vietnamese landlords and a class of landless tenants who worked the fields of the landlords for rents of up to 60 percent of the crop, which was sold by the landlords at the Saigon export market. The mounting export figures for rice resulted not only from the increase in cultivable land but also from the mounting degree of peasant exploitation.

Economic inequalities

The peasants who owned their land were rarely better off than the landless tenants. The peasants' share of the price of rice sold at the Saigon export market was less than 25 percent. Peasants continually lost their land to the large owners because they were unable to repay loans given them by the landlords and other moneylenders at exorbitant interest rates. As a result, the large landowners of Cochinchina (less than 3 percent of the total number of landowners) owned 45 percent of the land, while the small peasants (who accounted for about 70 percent of the owners) owned only about 15 percent of the land. The number of landless families in Vietnam before World War II was estimated at half of the population.

The peasants' share of the crop after the landlords, the moneylenders, and the middlemen (mostly Chinese) between producer and exporter had taken their share was still more drastically reduced by the direct and indirect taxes the French had imposed to finance their ambitious program of public works. Other ways of making the Vietnamese pay for the projects undertaken for the benefit of the French were the recruitment of forced labour for public works and the absence of any protection against exploitation in the mines and rubber plantations, although the scandalous working conditions, the low salaries, and the lack of medical care were frequently attacked in the French Chamber of Deputies in Paris. The mild social legislation decreed in the late 1920s was never adequately enforced.

Apologists for the colonial regime claimed that French rule led to vast improvements in medical care, education, transport, and communications. The statistics kept by the French, however, appear to cast doubt on such assertions. In 1939, for example, no more than 15 percent of all school-age children received any kind of schooling, and about 80 percent of the population was illiterate, in contrast to precolonial times when the majority of the people possessed some degree of literacy. With its more than 20,000,000 inhabitants in 1939, Vietnam had but one university, with fewer than 700 students. Only a small number of Vietnamese children were admitted to the lycées (secondary schools) for the children of the French. Medical care was well organized for the French in the cities, but in 1939 there were only 2 physicians for every 100,000 Vietnamese, compared with 76 per 100,000 in Japan and 25 in the Philippines.

Two other aspects of French colonial policy are signifi-

cant when considering the attitude of the Vietnamese people, especially their educated minority, toward the colonial regime: one was the absence of any kind of civil liberties for the native population, and the other was the exclusion of the Vietnamese from the modern sector of the economy, especially industry and trade. Not only were rubber plantations, mines, and industrial enterprises in foreign hands—French, where the business was substantial, and Chinese on the lower levels—but all other business was as well, from local trade to the great export-import houses. The social consequence of this policy was that, apart from the landlords, no property-owning indigenous middle class developed in colonial Vietnam. Thus, capitalism appeared to the Vietnamese to be a product of foreign rule, a fact that, together with the lack of any Vietnamese participation in government, profoundly influenced the nature and orientation of the national resistance movements.

Resistance to French rule

Movements of national liberation. The anticolonial movement in Vietnam can be said to have started with the establishment of French rule. Many local officials of Cochinchina refused to collaborate with the French. Some led guerrilla groups, composed of the remnants of the defeated armies, in attacks on French outposts. A much broader resistance movement developed in Annam in 1885, led by the great scholar Phan Dinh Phung, whose rebellion collapsed only after his death in 1895.

The main characteristic of the national movement during this first phase of resistance, however, was its political orientation toward the past. Filled with ideas of precolonial Vietnam, its leaders wanted to be rid of the French in order to reestablish the old imperial order. Because this aspiration could have little meaning for the generation that came to maturity after 1900, this first stage of anticolonial resistance did not survive the death of its leader.

Modern nationalism. A new national movement arose in the early 20th century. Its most prominent spokesman was Phan Boi Chau, with whose rise the old traditionalist opposition gave way to a modern nationalist leadership that rejected French rule but not Western ideas, science, and technology. In 1905 Chau went to Japan. His plan, mildly encouraged by some Japanese statesmen, was to free Vietnam with Japanese help. Chau smuggled hundreds of young Vietnamese into Japan, where they studied the sciences and underwent training for clandestine organization, political propaganda, and terrorist action. Inspired by Chau's effective writings, nationalist intellectuals in Hanoi opened the Free School of Tonkin in 1907, which soon became a centre of anti-French agitation and consequently was suppressed after a few months. Also, under the inspiration and guidance of Chau's followers, mass demonstrations demanding a reduction of high taxes took place in many cities in 1908. Hundreds of demonstrators and suspected organizers were arrested—some were condemned to death, while others were sent to Poulo Condore (Con Son) Island in the South China Sea, which the French turned into a penal camp for Vietnamese nationalists.

Phan Boi Chau went to China in 1910, where a revolution had broken out against the Ch'ing (Manchu) dynasty. There he set up a republican government-in-exile to attract the support of nationalist groups. After the French arranged his arrest and imprisonment in China (1914–17), however, his movement began to decline. In 1925 Chau was seized by French agents in Shanghai and brought back to Vietnam for trial; he died under house arrest in 1940.

After World War I the movement for national liberation intensified. A number of prominent intellectuals pursued the hope of obtaining political concessions from the colonial regime through collaboration with the French. The failure of such reformist efforts led to a revival of clandestine and revolutionary groups, especially in Annam and Tonkin; among these was the Vietnamese Nationalist Party (Viet Nam Quoc Dan Dang, founded in 1927 and usually referred to as the VNQDD). The VNQDD preached terrorist action and penetrated the garrisons of indigenous troops with a plan to oust the French in a military uprising. On the night of Feb. 9–10, 1930, the troops of only one garrison in Tonkin killed their French officers, but they were overwhelmed a day later and summarily executed. A wave of repression followed that took hundreds of lives and sent thousands to prison camps. The VNQDD was virtually destroyed, and for the next 15 years it existed mainly as a group of exiles in China supported by the Chinese Nationalist Party (Kuomintang).

French repression

Vietnamese communism. For yet another reason, the year 1930 was an important one in the history of Vietnam. Five years earlier, a new figure, destined to become the most prominent leader in the national movement, had appeared on the scene as an exiled revolutionary in South China. He was Nguyen Ai Quoc, better known by his later pseudonym of Ho Chi Minh. In June 1925 Ho Chi Minh founded the Revolutionary Youth League of Vietnam, the predecessor of the Indochinese Communist Party.

Ho Chi Minh had left Vietnam as a young seaman in 1911 and traveled widely before settling in Paris in 1917. He joined the Communist Party of France in 1920 and later spent several years in Moscow and China in the service of the international communist movement. After making his Revolutionary Youth League the most influential of all clandestine resistance groups, he succeeded in early 1930 in forming the Vietnamese Communist Party—from late 1930 called the Indochinese Communist Party—from a number of competing communist organizations. In May 1930 the communists exploited conditions of near starvation over large areas of central Vietnam by staging a broad peasant uprising, during which numerous Vietnamese officials and many landlords were killed, and "Soviet" administrations were set up in several provinces of Annam. It took the French until the spring of 1931 to suppress this movement and, in an unparalleled wave of terror, to reestablish their own control.

Unlike the dispersed and disoriented leadership of the VNQDD and some smaller nationalist groups, the Indochinese Communist Party recovered quickly from the setback of 1931, relying on cadres trained in the Soviet Union and China. After 1936, when the French extended some political freedoms to the colonies, the party skillfully exploited all opportunities for the creation of legal front organizations, through which its influence on intellectuals, workers, and peasants was increased. When political freedoms were again curtailed at the outbreak of World War II, the Communist Party, now a well-disciplined organization, was forced back into hiding.

World War II and independence. For five years during World War II, Indochina was a French-administered possession of Japan. On Sept. 22, 1940, Jean Decoux, the French governor-general appointed by the Vichy government after the fall of France, concluded an agreement with the Japanese that permitted the stationing of 30,000 Japanese troops in Indochina and the use of all major Vietnamese airports by the Japanese military. The agreement made Indochina the most important staging area for all Japanese military operations in Southeast Asia. The French administration cooperated with the Japanese occupation forces and was ousted only toward the end of the war (in March 1945), when the Japanese began to fear that the French forces might turn against them as defeat approached. After the French had been disarmed, Bao Dai, the last French-appointed emperor of Vietnam, was allowed to proclaim the independence of his country and to appoint a Vietnamese national government at Hue, but all real power remained in the hands of the Japanese military commanders.

Japanese ouster of the French

Meanwhile, in May 1941, at Ho Chi Minh's urging, the Communist Party formed a broad nationalist alliance under its leadership called the League for the Independence of Vietnam, which subsequently became known as the Viet Minh. After a short period in jail, Ho was released by the Chinese and began to cooperate with Allied forces by providing information on Japanese troop movements in Indochina. At the same time, he sought recognition of the Viet Minh as the legitimate representative of Vietnamese nationalist aspirations. When the Japanese surrendered in August 1945, the communist-led Viet Minh ordered a general uprising, and, with no one organized to oppose them, they were able to seize power in Hanoi. Bao Dai, the Vietnamese emperor, abdicated a few days later and declared his fealty to the newly proclaimed Democratic Republic of Vietnam.

Clearly the Communist Party had gained the upper hand in its struggle to outmaneuver its disorganized rivals, such as the noncommunist VNQDD. The French, however, were determined to restore their own colonial presence in Indochina and, with the aid of British occupation forces, seized control of Cochinchina. Thus, at the beginning of 1946, there were two Vietnams: a communist north and a noncommunist south. (J.Bu./W.J.D.)

The First Indochina War. Negotiations between the French and Ho Chi Minh led to an agreement in March 1946 that appeared to promise a peaceful solution. Under the agreement France would recognize the Viet Minh government and give Vietnam the status of a free state within the French Union. French troops were to remain in Vietnam, but they would be withdrawn progressively over five years. For a period in early 1946 the French cooperated with Ho Chi Minh as he consolidated the Viet Minh's dominance over other nationalist groups, in particular those politicians who were backed by the Chinese Nationalist Party.

Despite tactical cooperation between the French and the Viet Minh, their policies were irreconcilable: the French aimed to reestablish colonial rule, while Hanoi wanted total independence. French intentions were revealed in the decision of Georges-Thierry d'Argenlieu, the high commissioner for Indochina, to proclaim Cochinchina an autonomous republic in June 1946. Further negotiations did not resolve the basic differences between the French and the Viet Minh. In late November 1946 French naval vessels bombarded Haiphong, causing several thousand civilian casualties; the subsequent Viet Minh attempt to overwhelm French troops in Hanoi in December generally is considered to be the beginning of the First Indochina War.

Outbreak of war

Initially confident of victory, the French long ignored the real political cause of the war—the desire of the Vietnamese people, including their anticommunist leaders, to achieve unity and independence for their country. French efforts to deal with this problem were devious and ineffective. The French reunited Cochinchina with the rest of Vietnam in 1949, proclaiming the Associated State of Vietnam, and appointed the former emperor Bao Dai as chief of state. Most nationalists, however, denounced these maneuvers, and leadership in the struggle for independence from the French remained with the Viet Minh.

Meanwhile, the Viet Minh waged an increasingly successful guerrilla war, aided after 1949 by the new communist government of China. The United States, fearful of the spread of communism in Asia, sent large amounts of aid to the French. But the French were shaken by the fall of their garrison at Dien Bien Phu in May 1954 and agreed to negotiate an end to the war at an international conference in Geneva.

The two Vietnams (1954–65). The agreements concluded in Geneva in April–July 1954 (collectively called the Geneva Accords), which were signed by French and Viet Minh representatives, provided for a cease-fire and for a temporary division of the country into two military zones at latitude 17° N. All Viet Minh forces were to withdraw north of that line, and all French and Associated State of Vietnam troops were to remain south of it; permission was granted for refugees to move from one zone to the other within a given time limit. An international commission was established, composed of Canadian, Polish, and Indian members under an Indian chairman, to supervise the execution of the agreement.

This agreement left the Democratic Republic of Vietnam in control of only the northern half of the country. The last of the Geneva Accords—called the Final Declaration—provided for elections, supervised by the commission, to be held throughout Vietnam in July 1956 in order to unify the country. Viet Minh leaders appeared certain to win these elections, and the United States and South Vietnam would not approve or sign the Final Declaration; elections were never held.

The two Vietnams now began to reconstruct their war-ravaged country. With assistance from the Soviet Union and China, the Hanoi government in the north embarked on an ambitious program of socialist industrialization; they also began to collectivize agriculture in earnest in 1958. In the south a new government appointed by Bao Dai began to build a new country. Ngo Dinh Diem, a Roman Catholic, was named prime minister and succeeded with American support in stabilizing the anticommunist regime in Saigon. He eliminated pro-French elements in the military and abolished the local autonomy of several religious-political groups. Then, in a government-controlled referendum in October 1955, Diem removed Bao Dai as chief of state and made himself president of the Republic of Vietnam.

Diem's early success in consolidating power did not result in concrete political and economic achievements. Plans for land reform were sabotaged by entrenched interests. With the financial backing of the United States, the regime's chief energies were directed toward building up the military and a variety of intelligence and security forces to counter the still-influential Viet Minh. Totalitarian methods were directed against all who were regarded as opponents, and the favouritism shown to Roman Catholics alienated the majority Buddhist population. Loyalty to the president and his family was made a paramount duty, and Diem's brother, Ngo Dinh Nhu, founded an elitist party to clandestinely spy on officials, army officers, and prominent local citizens. Diem also refused to participate in the all-Vietnamese elections described in the Final Declaration. With support from the north, communist-led forces—popularly called the Viet Cong—launched an insurgency movement to seize power and reunify the country. The insurrection appeared close to succeeding, when Diem's army overthrew him in November 1963. Diem and his brother Nhu were killed in the coup.

Rule of Diem

The Second Indochina War. The government that seized power after Diem's ouster, however, was no more effective than its predecessor. A period of political instability followed, until the military firmly seized control in June 1965 under Nguyen Cao Ky. The militant Buddhists who had helped overthrow Diem strongly opposed Ky's government, but he was able to break their resistance. Civil liberties were restricted, political opponents—denounced as neutralists or pro-communists—were imprisoned, and political parties were allowed to operate only if they did not openly criticize government policy. The character of the regime remained largely unchanged after the presidential elections in September 1967, which led to the election of General Nguyen Van Thieu as president.

No less evident than the oppressive nature of the Saigon regime was its inability to cope with the Viet Cong. Aided by a steady infiltration of weapons and advisers from the north, the fighting strength of the insurgent movement grew from about 30,000 men in 1963 to about 150,000 in 1965 when, in the opinion of many American intelligence analysts, the survival of the Saigon regime was seriously threatened. In addition, the political opposition in the south to Saigon became much more organized. The National Front for the Liberation of the South, popularly called the National Liberation Front (NLF), had been organized in late 1960; within four years it had a huge following.

Growing American involvement in the war. Until 1960 the United States had supported the Saigon regime and its army only with military equipment, financial aid, and, as permitted by the Geneva Accords, 700 advisers for training the army. The number of advisers had increased to 17,000 by the end of 1963, and they were joined by an increasing number of American helicopter pilots. All this assistance, however, proved insufficient to halt the advance of the Viet Cong, and in February 1965 U.S. President Lyndon B. Johnson ordered the bombing of North Vietnam, hoping to prevent further infiltration of arms and troops into the south. Four weeks after the bombing began, the United States started sending troops into the south. By July the number of U.S. troops had reached 75,000; it continued to climb until it stood at more than 500,000 early in 1968. Fighting beside the Americans were some 600,000 regular South Vietnamese troops and regional and self-defense forces, as well as smaller contingents from South Korea, Thailand, Australia, and New Zealand.

Buildup of U.S. troops

Three years of intensive bombing of the north and fight-

ing in the south, however, did not weaken the will and strength of the Viet Cong and their allies from the north. The infiltration of personnel and supplies down the famous Ho Chi Minh Trail increased, and some 100,000 regular troops from the north became more important. The continuing strength of the insurgent forces became evident in the so-called Tet Offensive that began in late January 1968, during which the Viet Cong and North Vietnamese attacked more than 100 cities and military bases. After that, the conviction grew in the U.S. government that it was not politically acceptable to sustain the war at such a level, and President Johnson ordered the bombing of the north to be reduced. This decision opened the way for U.S. negotiations with Hanoi, which began in Paris in May 1968. Once all bombing of the North was halted in November, the Paris talks were enlarged to include representatives of the NLF and the Saigon regime.

The war continued under President Richard M. Nixon, who began to withdraw U.S. troops gradually. However, public opposition to the war escalated in 1970 after he ordered attacks on the Ho Chi Minh Trail in Laos and Viet Cong sanctuaries inside Cambodia. In the meantime, the peace talks went on in Paris. (J.Bu./M.E.O./W.J.D.)

Withdrawal of U.S. troops. In January 1973 a peace treaty was signed by the United States and all three Vietnamese parties. It provided for the complete withdrawal of U.S. troops within 60 days and created a political process for the peaceful resolution of the conflict in the south. Nothing was said, however, about the presence of North Vietnamese troops in South Vietnam. The Paris Agreement did not bring an end to the fighting in Vietnam. The Saigon regime made a determined effort to eliminate the communist forces remaining in the south, while northern leaders continued to strengthen their own military forces in preparation for a future confrontation. By late 1974 Hanoi had decided that victory could be achieved only through armed struggle, and early the next year North Vietnamese troops launched a major offensive against the south. Saigon's forces retreated in panic, and President Thieu ordered the abandonment of several northern provinces. Thieu's effort to stabilize the situation was too late, however, and on April 30, 1975, the communists entered Saigon in triumph.

The Socialist Republic of Vietnam. Following the communist victory, Vietnam was reunited on July 2, 1976, when the Socialist Republic of Vietnam was officially proclaimed, with its capital at Hanoi. The country faced formidable problems. In the south, millions of people had been made homeless by the war, and more than one-seventh of the population had been killed or wounded; the costs in the north were probably as high or higher. Plans to reconstruct the country called for expanding industry in the north and agriculture in the south, but it quickly became clear that these goals would be difficult to achieve.

Reunification of the country

Hanoi had been at war for more than a generation—indeed, Ho Chi Minh had died in 1969—and the bureaucracy was poorly trained to deal with the problems of peacetime economic recovery. The government encountered considerable resistance to its policies, particularly in the huge metropolis of Saigon (renamed Ho Chi Minh City in 1976), where members of the commercial sector—many of whom were ethnic Chinese—resisted the new socialist economic measures and assignment to "new economic zones" in the countryside. During the late 1970s the country also suffered major floods and drought that severely reduced food production. When the regime suddenly announced a program calling for the socialization of industry and agriculture in the south in early 1978, hundreds of thousands of people (mainly ethnic Chinese) fled the country on foot or by boat.

These internal difficulties were compounded by problems in foreign affairs. The regime pursued plans to form alliances with new revolutionary governments in neighbouring Laos and Cambodia (Kampuchea), which risked incurring not only the hostility of the United States but also that of China, which had its own interests in those countries. As Sino-Vietnamese relations soured, Hanoi signed a treaty of friendship and cooperation with the Soviet Union. Meanwhile, relations with Cambodia rapidly deteriorated when it rejected Hanoi's offer of a close relationship among the three countries of the former French Indochina. Savage border fighting culminated in a Vietnamese invasion of Cambodia in December 1978. The Khmer Rouge were dislodged from power, and a pro-Vietnamese government was installed in Phnom Penh.

Khmer Rouge forces took refuge in isolated areas of the country and began a guerrilla war of resistance against the new government, the latter backed by some 200,000 Vietnamese troops. In the meantime, China launched a brief but fierce punitive invasion along the Sino-Vietnamese border in early 1979 in response to Vietnamese actions in Cambodia. During the month-long war the Chinese destroyed major Vietnamese towns and inflicted heavy damage in the frontier zone, but they also suffered heavy casualties from the Vietnamese defenders.

Vietnam was now nearly isolated in the world. Apart from the protégé regime in Phnom Penh and the government of Laos, which also was heavily dependent on Vietnamese aid for its survival, the country was at odds with the remainder of its regional neighbours. The member states of the Association of Southeast Asian Nations opposed Vietnam's occupation of Cambodia and joined with China in supporting the Khmer Rouge and various noncommunist Cambodian groups. The United States and most other Western countries imposed a trade embargo on Vietnam. Only the Soviet Union and its eastern European allies stood by Vietnam.

Under such severe external pressure, Vietnam suffered continuing economic difficulties. The cost of stationing troops in Cambodia and of defending the border with China was heavy. To make matters worse, the regime encountered continuing problems in integrating the southern provinces into a socialist economy. In 1986 the party launched an economic reform program (*doi moi*). Implementation did not begin until 1988, however, when an economic crisis and declining Soviet support forced the party to cut spending, court foreign investment, liberalize trade, and permit free market activities.

Economic reforms

These measures stabilized the economy, but the collapse of communism in eastern Europe and disintegration of the Soviet Union left Vietnam isolated. Vietnam sought to improve relations with other countries by completely withdrawing its forces from Cambodia in September 1989 and participating in a peace conference in Paris that ended the conflict in 1991. This settlement permitted the normalization of relations with China, Japan, and Europe. Vietnam's assistance in determining the fate of Americans missing-in-action led the United States to lift the embargo in 1994 and establish diplomatic relations with Hanoi in 1995. Admission to membership in the Association of Southeast Asian Nations in July 1995 symbolized Vietnam's acceptance into the family of nations.

Peace allowed Vietnam to concentrate on the economic reforms begun in the late 1980s, and the economy grew rapidly through the 1990s. Success, however, has reduced the commitment to change and raised concern about preserving Vietnam's "socialist orientation," evident in the continued prominence of state-owned enterprises. Leaders have also worried that the corruption, inequality, and materialism associated with the market economy could undermine support for the party, and noncommunists have been excluded from power. Nonetheless, in July 2000 Vietnam signed a trade agreement with the United States that was a major step toward membership in the World Trade Organization. In that same month Vietnam opened its first stock exchange. (M.E.O./W.J.D./Ed.)

For later developments in the history of Vietnam, see the BRITANNICA BOOK OF THE YEAR.

BIBLIOGRAPHY

General works. GEORGE KURIAN (ed.), *Encyclopedia of the Third World*, 4th ed., 3 vol. (1992), and *Atlas of the Third World*, 2nd ed. (1992); and RICHARD ULACK and GYULA PAUER, *Atlas of Southeast Asia* (1989), contain general descriptions of the individual countries. Comprehensive annual publications include *The Far East and Australasia* and *Asia Yearbook*.

Physical and human geography. Two classic geography texts are E.H.G. DOBBY, *South East Asia*, 11th ed. (1973); and CHARLES A. FISHER, *South-East Asia*, 2nd ed. (1966). KEITH BUCHANAN,

The Southeast Asian World (1967), is older but still a useful overview. JOSEPH E. SPENCER and WILLIAM L. THOMAS, *Asia, East by South*, 2nd ed. (1971); JOSEPH E. SPENCER, *Oriental Asia* (1973); and R.D. HILL (ed.) *South-East Asia* (1979), also are valuable. Detailed studies of specific topics include CHARLES S. HUTCHISON, *Geological Evolution of South-East Asia* (1988); K. TAKAHASHI and H. ARAKAWA (eds.), *Climates of Southern and Western Asia* (1981); N. MARK COLLINS, JEFFREY A. SAYER, and TIMOTHY C. WHITMORE (eds.), *The Conservation Atlas of Tropical Forests: Asia and the Pacific* (1991); and TIMOTHY C. WHITMORE, *Tropical Rain Forests of the Far East*, 2nd ed. (1984).

Encyclopedia of World Cultures, vol. 5, *East and Southeast Asia*, ed. by PAUL HOCKINGS (1993), contains good introductory essays on the region's numerous ethnic groups; and FRANK M. LEBAR, GERALD C. HICKEY, and JOHN K. MUSGRAVE, *Ethnic Groups of Mainland Southeast Asia* (1964), though dated, is still a good general work. RONALD PROVENCHER, *Mainland Southeast Asia* (1975), is an anthropological treatment. VICTOR PURCELL, *The Chinese in Southeast Asia*, 2nd ed. (1965, reissued 1980), is a classic work. GEHAN WIJEYEWARDENE (ed.), *Ethnic Groups Across National Boundaries in Mainland Southeast Asia* (1990), concentrates on the Thai border area. Also useful are GUY HUNTER, *South-East Asia—Race, Culture, and Nation* (1966); ROBBINS BURLING, *Hill Farms and Padi Fields: Life in Mainland Southeast Asia* (1965); JONATHAN RIGG, *Southeast Asia: A Region in Transition* (1991); and FRED R. VON DER MEHDEN, *Religion and Modernization in Southeast Asia* (1986). Among works on urbanization are T.G. MCGEE, *The Southeast Asian City* (1967), older but still useful; and PAUL WHEATLEY, *Nāgara and Commandery: Origins of the Southeast Asian Urban Traditions* (1983).

General surveys of the region's economy include CHRIS DIXON, *South East Asia in the World-Economy* (1991); and BRIAN WAWN, *The Economies of the ASEAN Countries* (1982). Among the studies of economic development are DONALD W. FRYER, *Emerging Southeast Asia*, 2nd ed. (1979), a well-written, insightful book; DENIS DWYER (ed.), *South East Asian Development* (1990); DAVID DRAKAKIS-SMITH, *Pacific Asia* (1992), a brief text; and RICHARD ROBISON, KEVIN HEWISON, and RICHARD HIGGOTT (eds.), *Southeast Asia in the 1980s: The Politics of Economic Crisis* (1987). Discussions of resource utilization include GEORGE KENT and MARK J. VALENCIA (eds.), *Marine Policy in Southeast Asia* (1985); LIM TECK GHEE and MARK J. VALENCIA (eds.), *Conflict Over Natural Resources in South-east Asia and the Pacific* (1990); and MARK J. VALENCIA, *South-east Asian Seas: Oil Under Troubled Waters* (1985). INTERNATIONAL ASSOCIATION OF AGRICULTURAL ECONOMISTS, *World Atlas of Agriculture*, vol. 2, *Asia and Oceania* (1973), offers a good background treatment. THOMAS R. LEINBACH and CHIA LIN SIEN, *South-East Asian Transport* (1989), discusses regional transport development. (T.R.L.)

History. *General:* A comprehensive overview is NICHOLAS TARLING (ed.), *The Cambridge History of Southeast Asia*, 2 vol. (1992); while MILTON OSBORNE, *Southeast Asia*, 5th ed. (1990), is a brief survey. JOHN FRANK CADY, *Southeast Asia* (1964), though older and marred by some factual errors, is well-organized. D.G.E. HALL, *A History of South-East Asia*, 4th ed. (1981), while thorough, is heavily slanted toward colonial topics and views.

Southeast Asia to c. 1750: PETER BELLWOOD, *Prehistory of the Indo-Malaysian Archipelago* (1985), is detailed and thought-provoking. CHARLES HIGHAM, *The Archaeology of Mainland Southeast Asia: From 10,000 B.C. to the Fall of Angkor* (1989), complements Bellwood, with more focus on archaeology. Collections of essays include DAVID G. MARR and A.C. MILNER (eds.), *Southeast Asia in the 9th to 14th Centuries* (1986); and R.B. SMITH and W. WATSON (eds.), *Early South East Asia* (1979). ANTHONY REID, *Southeast Asia in the Age of Commerce, 1450–1680*, 2 vol. (1988–93), provides a broad-based glimpse of the region that previously had not been available. DONALD F. LACH, *Southeast Asia in the Eyes of Europe: The Sixteenth Century* (1968), contains a selection of travel accounts by Europeans. ANTHONY REID and LANCE CASTLES (eds.), *Pre-colonial State Systems in Southeast Asia* (1975), includes several specific treatments. The classic by M.A.P. MEILINK-ROELOFSZ, *Asian Trade and European Influence in the Indonesian Archipelago Between 1500 and About 1630* (1962), is still useful. LORRAINE GESICK (ed.), *Centers, Symbols, and Hierarchies* (1983), is a collection of essays on the region's classical states.

Southeast Asia since c. 1750: DAVID JOEL STEINBERG *et al.*, *In Search of Southeast Asia: A Modern History*, rev. ed. (1987), is a sophisticated treatment, but its focus shifts from era to era. JOHN BASTIN and HARRY J. BENDA, *A History of Modern Southeast Asia: Colonialism, Nationalism, and Decolonization* (1968), although dated, is still worthy of careful attention. SYED HUSSEIN ALATAS, *The Myth of the Lazy Native: A Study of the Image of the Malays, Filipinos, and Javanese From the 16th to the 20th Century and Its Function in the Ideology of Colonial Capitalism* (1977), is a convincing attack by a Southeast Asian intellectual on colonialism and colonial scholarship in the region. D.J.M. TATE, *The Making of Modern South-East Asia*, 2 vol. (1971–79), treats the middle portion of the colonial age in detail. DAVID K. WYATT and ALEXANDER WOODSIDE (eds.), *Moral Order and the Question of Change* (1982), explores social and intellectual history. FRED R. VON DER MEHDEN, *South-East Asia, 1930–1970: The Legacy of Colonialism and Nationalism* (1974), although dated, is a well-illustrated, useful introduction to the postwar region. RONALD D. PALMER and THOMAS J. RECKFORD, *Building ASEAN* (1987), offers a basic introduction to the organization's first 20 years. Each essay in ALFRED W. MCCOY (ed.), *Southeast Asia Under Japanese Occupation* (1974), has its own locale and slant, although it cannot substitute for a general history of the occupation. JAN PLUVIER, *South-East Asia from Colonialism to Independence* (1974), is the most thorough treatment of the period 1942–*c.* 1965. CLARK D. NEHER, *Southeast Asia in the New International Era* (1991), has a political-science emphasis. (W.H.F.)

Brunei. Perhaps the most reliable and up-to-date reference source on the country is *Country Profile: Malaysia, Brunei* (annual). A collection of papers on the country's natural resources and environment is found in a special issue of *Singapore Journal of Tropical Geography*, vol. 13, no. 1 (June 1992). CHUA THIA-ENG, CHOU LOKE MING, and MARIE SOL M. SADORRA (eds.), *The Coastal Environmental Profile of Brunei Darussalam* (1987), includes articles on land use, population, and the institutional framework. Other economic studies include TILAK DOSHI, "Brunei: The Steady State," *Southeast Asian Affairs* (1991), pp. 71–80; and SRITUA ARIEF, *The Brunei Economy* (1986).

D.E. BROWN, *Brunei* (1970), chronicles the history of the sultanate from the early 19th century to the late 1960s. A well-researched standard text is RANJIT SINGH, *Brunei, 1839–1983* (1984). K.U. MENON, "Brunei Darussalam in 1986: In Search of the Political Kingdom," *Southeast Asian Affairs* (1987), pp. 85–101, traces political developments in the first three years of full independence. See also ABU BAKAR HAMZAH, "Brunei Darussalam Continuity and Tradition," *Southeast Asian Affairs* (1989), pp. 91–104; and ZAINAL KLING, "The Changing International Image of Brunei," *Southeast Asian Affairs* (1990), pp. 89–100. (O.J.B.)

Cambodia. General introductions are RUSSELL R. ROSS (ed.), *Cambodia: A Country Study*, 3rd ed. (1990); DAVID P. CHANDLER, *The Land and People of Cambodia* (1992); and MICHAEL VICKERY, *Kampuchea: Politics, Economics, and Society* (1986). JEAN DELVERT, *Le Paysan cambodgien* (1961), is a magisterial work. BEN KIERNAN and CHANTHOU BOUA (eds.), *Peasants and Politics in Kampuchea, 1942–1981* (1982), is a useful anthology. RÉMY PRUD'HOMME, *L'Économie du Cambodge* (1969), is the only detailed study of the Cambodian economy and is still of historical interest.

DAVID P. CHANDLER, *A History of Cambodia*, 2nd ed. (1992), traces the country's beginnings through the 1980s and is supplemented by his *The Tragedy of Cambodian History* (1991), a detailed political history since World War II. CLAUDE JACQUES, *Angkor* (1990), is an up-to-date treatment (in French) by France's leading Angkorean scholar. An indispensable work for scholars is LAWRENCE PALMER BRIGGS, *The Ancient Khmer Empire* (1951, reprinted 1962). In addition to the works by Chandler above, modern Cambodian history is analyzed in BEN KIERNAN, *How Pol Pot Came to Power* (1983); WILLIAM SHAWCROSS, *Sideshow: Kissinger, Nixon, and the Destruction of Cambodia*, rev. ed. (1987); KARL D. JACKSON (compiler), *Cambodia, 1975–1978* (1989); and MICHAEL VICKERY, *Cambodia, 1975–1982* (1984), probably the best book-length analysis of the revolutionary era. (D.P.Ch.)

Laos. FRANK M. LEBAR and ADRIENNE SUDDARD (eds.), *Laos*, rev. ed. (1967), is a general survey. GRANT EVANS, *Lao Peasants Under Socialism* (1990), treats ethnography and economics. MARTIN STUART-FOX, *Laos* (1986), is the standard work, with good chapters on the economic system and domestic policies. A more current overview is found in WILLIAM WORNER, "Economic Reform and Structural Change in Laos," *Southeast Asian Affairs* (1989), pp. 187–208. JOSEPH J. ZASLOFF and LEONARD UNGER (eds.), *Laos: Beyond the Revolution* (1991), examines political, economic, social, and foreign policies. Further information can be found in the annotated bibliography by HELEN CORDELL (compiler), *Laos* (1991). (A.J.D.)

ARTHUR J. DOMMEN, *Laos: Keystone of Indochina* (1985), is a brief general history, and his *Conflict in Laos*, rev. ed. (1971), a political history, focuses primarily on the period from the early 1950s to 1970. HUGH TOYE, *Laos* (1968), depicts Laos' historic position between Vietnam and Thailand. PAUL F. LANGER and JOSEPH J. ZASLOFF, *North Vietnam and the Pathet Lao* (1970), studies the role of communist North Vietnam in the origin and development of the Lao communist movement. JOSEPH J. ZASLOFF, *The Pathet Lao* (1973), examines the political dynamics

of the group, its leadership, commanding party, front, political and administrative organizations, and military forces. MARTIN STUART-FOX (ed.), *Contemporary Laos* (1982), is a collection of essays. MACALISTER BROWN and JOSEPH J. ZASLOFF, *Apprentice Revolutionaries: The Communist Movement in Laos, 1930–1985* (1985), provides a political analysis. (J.J.Z.)

Malaysia. R.S. MILNE and DIANE K. MAUZY, *Malaysia* (1986), is a comprehensive overview. OOI JIN-BEE, *Peninsular Malaysia*, new ed. (1976), offers a good geographic overview of the country. JAMES C. JACKSON, *Sarawak* (1968), is one of the few quality studies of the state. Studies of Malaysia's people include JUDITH NAGATA, *Malaysian Mosaic: Perspectives from a Polyethnic Society* (1979); KERNIAL SINGH SANDHU, *Indians in Malaya: Some Aspects of Their Immigration and Settlement (1786–1957)* (1969); HEATHER STRANGE, *Rural Malay Women in Tradition and Transition* (1981); HENG PEK KOON, *Chinese Politics in Malaysia: A History of the Malaysian Chinese Association* (1988); and JAMES V. JESUDASON, *Ethnicity and the Economy: The State, Chinese Business, and Multinationals in Malaysia* (1989). RAJ KUMAR, *The Forest Resources of Malaysia, Their Economics and Development* (1986); and S. ROBERT AIKEN *et al., Development and Environment in Peninsular Malaysia* (1982), focus on both environmental concerns and economic development. Other economic studies include MOHAMED ARIFF, *The Malaysian Economy* (1991); and GEORGE CHO, *The Malaysian Economy: Spatial Perspectives* (1990). See also E.K. FISK and H. OSMAN-RANI (eds.), *The Political Economy of Malaysia* (1982); and GORDON P. MEANS, *Malaysian Politics: The Second Generation* (1991). (T.R.L.)

The best comprehensive history of Malaysia is BARBARA WATSON ANDAYA and LEONARD Y. ANDAYA, *A History of Malaysia* (1982). A good survey is JOHN GULLICK, *Malaysia: Economic Expansion and National Unity* (1981). Both of these works are stronger on Malaya than on the Borneo states. STEVEN RUNCIMAN, *The White Rajahs: A History of Sarawak from 1841 to 1946* (1960); and ROBERT PRINGLE, *Rajahs and Rebels: The Ibans of Sarawak Under Brooke Rule, 1841–1941* (1970), provide excellent coverage of the Brooke era. Among the few detailed accounts of ancient Malaya, PAUL WHEATLEY, *The Golden Khersonese: Studies in the Historical Geography of the Malay Peninsula Before A.D. 1500* (1961, reprinted 1973), remains a classic work. LEONARD Y. ANDAYA, *The Kingdom of Johor, 1641–1728* (1975), is a fine analysis of that sultanate. LIM TECK GHEE, *Peasants and Their Agricultural Economy in Colonial Malaya, 1874–1941* (1977), treats economic history during the colonial era. WILLIAM R. ROFF, *The Origins of Malay Nationalism* (1967), is a stimulating work that explores Malay society in the colonial years. VICTOR PURCELL, *The Chinese in Malaya* (1948, reissued 1967), though somewhat dated, remains the only general survey. R.S. MILNE and DIANE K. MAUZY, *Politics and Government in Malaysia*, rev. ed. (1980), is particularly good on the late colonial and early independence periods. (C.A.Lo.)

Myanmar. FREDERICA M. BUNGE (ed.), *Burma: A Country Study*, 3rd ed. (1983), is an overview. Many of the English-language works on Myanmar's geography were produced by the British during the colonial period. Among these are the still invaluable *Burma Gazetteer*, 30 vol. (1868–1935), with detailed surveys of different administrative districts; *The British Burma Gazetteer*, 2 vol. (1879–80, reprinted as *Gazetteer of Burma*, 1987); J. GEORGE SCOTT and J.P. HARDIMAN (compilers), *Gazetteer of Upper Burma and the Shan States*, 3 vol. in 5 (1900–01, reprinted 2 vol. in 5, 1983); and H.L. CHHIBBER, *The Physiography of Burma* (1933, reprinted 1975). Also dated but still useful is HELLMUT DE TERRA and HALLAM L. MOVIUS, JR., "Research on Early Man in Burma," *Transactions of the American Philosophical Society*, new series, 32(3):267–393 (1943). MICHAEL AUNG-THWIN, *Irrigation in the Heartland of Burma* (1990), studies the productive capacity and geography of pre-colonial Myanmar. Agriculture is detailed in M.Y. NUTTONSON, *The Physical Environment and Agriculture of Burma* (1963), a brief, technical study; CHENG SIOK-HWA, *The Rice Industry of Burma, 1852–1940* (1968), the only book-length study in English covering the topic during that period; and U KHIN WIN, *A Century of Rice Improvement in Burma* (1991), a more recent study.

MICHAEL AUNG-THWIN, "Spirals in Early Southeast Asian and Burmese History," *The Journal of Interdisciplinary History*, 21(4):575–602 (Spring 1991), is a theoretical and conceptual treatment of broad historical patterns. G.H. LUCE, *Phases of Pre-Pagán Burma*, 2 vol. (1985), studies the 9th century in detail. AUNG THAW, *Historical Sites in Burma* (1972), deals with the pre-Pagan period. G.H. LUCE *et al., Old Burma—Early Pagán*, 3 vol. (1969–70), is the classic study of this kingdom. MICHAEL AUNG-THWIN, *Pagan: The Origins of Modern Burma* (1985), studies the kingdom's institutional history. PAUL J. BENNETT, "The 'Fall of Pagan': Continuity and Change in 14th-Century Burma," in his *Conference Under the Tamarind Tree: Three Essays in Burmese History* (1971), pp. 3–53, assesses the manner in which continuity and change made their mark on early Myanmar history. MICHAEL AUNG-THWIN, "The Role of Sasana Reform in Burmese History: Economic Dimensions of a Religious Purification," *The Journal of Asian Studies*, 38(4):671–688 (August 1979), details the economic relationship between church and state. VICTOR B. LIEBERMAN, *Burmese Administrative Cycles: Anarchy and Conquest, c. 1580–1760* (1984), analyzes the Toungoo dynasty. WILLIAM J. KOENIG, *The Burmese Polity, 1752–1819* (1990), studies the early period of the last Myanmar dynasty. OLIVER B. POLLAK, *Empires in Collision: Anglo-Burmese Relations in the Mid-Nineteenth Century* (1979), treats British policy and its effects on later colonization. DOROTHY WOODMAN, *The Making of Burma* (1962), is the most thorough account of theretofore secret British decisions in the colonization of Burma. MICHAEL ADAS, *The Burma Delta: Economic Development and Social Change on an Asian Rice Frontier, 1852–1941* (1974), traces the agricultural development of this area and its significance on modern history. JOHN F. CADY, *A History of Modern Burma* (1958, reissued 1965), is still the most complete text on the early years of the modern country. JOSEF SILVERSTEIN, *Burmese Politics* (1980), offers a Western perspective on 20th-century politics. More recent studies on the modern state include ROBERT H. TAYLOR *The State in Burma* (1987); DAVID I. STEINBERG, *Burma: A Socialist Nation of Southeast Asia* (1982); and MARTIN SMITH, *Burma: Insurgency and the Politics of Ethnicity* (1991). (M.A.A.-T.)

Singapore. Overviews are provided by PHILIPPE REGNIER, *Singapore: A City-State in South East Asia* (1991); and R.S. MILNE and DIANE K. MAUZY, *Singapore: The Legacy of Lee Kuan Yew* (1990). TANIA LI, *Malays in Singapore* (1989), is a thorough study. Economic development and government policies are surveyed in PETER S.J. CHEN, *Singapore Development Policies and Trends* (1983); LIM CHONG-YAH and PETER J. LLOYD (eds.), *Singapore: Resources and Growth* (1986); LINDA LIM and PANG ENG FONG, *Trade, Employment, and Industrialisation in Singapore* (1986), an excellent analysis; TILAK DOSHI, *Houston of Asia: The Singapore Petroleum Industry* (1989); GARRY RODAN, *The Political Economy of Singapore's Industrialization* (1989), a discussion of the role of the government in engineering development; FREDERICK DEYO, "Singapore: Developmental Paternalism," in STEVEN M. GOLDSTEIN (ed.), *Minidragons: Fragile Economic Miracles in the Pacific* (1991), pp. 48–87, a candid article on the impact of state policies; and KERNIAL SINGH SANDHU and PAUL WHEATLEY (eds.), *Management of Success: The Moulding of Modern Singapore* (1989), a collection of essays.

C.M. TURNBULL, *A History of Singapore, 1819–1988*, 2nd ed. (1989), is the key historical study on the nation, with an excellent bibliography. DONALD MOORE and JOANNA MOORE, *The First 150 Years of Singapore* (1969), is an older but still useful work. A more recent survey is ERNEST C.T. CHEW and EDWIN LEE (eds.), *A History of Singapore* (1991). YEN CHING-HWANG, *A Social History of the Chinese in Singapore and Malaya, 1800–1911* (1986), is written from Chinese records and accounts. L.K. WONG, "Singapore: Its Growth as an Entrepot Port, 1819–1941," *Journal of Southeast Asian Studies*, 9(1):50–84 (March 1978), is the best treatment of economic history up to World War II. ALEX JOSEY, *Singapore* (1979), stresses the contemporary period from a pro-People's Action Party stance. (T.R.L.)

Thailand. Surveys of the country include ELLIOTT KULICK and DICK WILSON, *Thailand's Turn: Profile of a New Dragon* (1992); and FRANK J. MOORE and CLARK D. NEHER, *Thailand—Its People, Its Society, Its Culture* (1974). ROBERT L. PENDLETON, *Thailand* (1962, reprinted 1976), still provides a clearly presented and readable description of physical geography. PAUL LEWIS and ELAINE LEWIS, *Peoples of the Golden Triangle* (1984), describes six northern tribes; while SERI PHONGPHIT and KEVIN HEWISON, *Thai Village Life* (1990), contains an excellent portrayal of the people of the northeast. WOLF DONNER, *The Five Faces of Thailand* (1978), surveys economic geography in detail through the 1970s. LUCIEN M. HANKS, *Rice and Men: Agricultural Ecology in Southeast Asia* (1972, reissued 1992), although dated, is one of the best introductions to daily life and social and economic changes in rice-growing villages in central Thailand. WILLIAM J. KLAUSNER, *Reflections on Thai Culture*, 3rd ed. (1987), collects articles on village life in the northeast and on Thai culture and values. (Ja.A.H.)

DAVID K. WYATT, *Thailand* (1984), is a major reference work giving a detailed historical overview. Other general studies include CHARLES KEYES, *Thailand: Buddhist Kingdom as Modern Nation-State* (1987). CHARNVIT KASETSIRI, *The Rise of Ayudhya: A History of Siam in the Fourteenth and Fifteenth Centuries* (1976), is a detailed survey. AKIN RABIBHADANA, *The Organization of Thai Society in the Early Bangkok Period, 1782–1873* (1969), is a basic source on traditional 19th-century society. HONG LYSA, *Thailand in the Nineteenth Century* (1984), is the most comprehensive socioeconomic history of this period.

WALTER F. VELLA and DOROTHY B. VELLA, *Chaiyo!: King Vajiravudh and the Development of Thai Nationalism* (1978), is a thorough study of the early 20th century. BENJAMIN A. BATSON, *The End of the Absolute Monarchy in Siam* (1984), analyzes the political and social conditions of the 1920s and '30s that set the stage for later events. JUDITH A. STOWE, *Siam Becomes Thailand* (1991), describes the period from the abolition of the absolute monarchy in 1932 through World War II. THAK CHALOEMTIARANA, *Thailand: The Politics of Despotic Paternalism* (1979), analyzes the rise of the military from the return of Phibun in 1947 to the Sarit coup of 1957 and discusses the character of military rule in Thailand. JOHN L.S. GIRLING, *Thailand* (1981), focuses especially on the period 1963–77; and DAVID MORELL and CHAI-ANAN SAMUDAVANIJA, *Political Conflict in Thailand* (1981), is a detailed study of the 1970s.

(E.J.K./C.F.Ke.)

Vietnam. DAVID W.P. ELLIOT *et al., Vietnam: Essays on History, Culture, and Society* (1985), is a solid and readable introduction. A comprehensive analysis of Vietnamese society and culture is NEIL L. JAMIESON, *Understanding Vietnam* (1993). Other studies of peoples and society include PIERRE GOUROU, *The Peasants of the Tonkin Delta,* 2 vol. (1955, originally published in French, 1936), a monumental work; three books by GERALD C. HICKEY, *Village in Vietnam* (1964), a classic ethnography of the upper Mekong delta in the 1950s, *Sons of the Mountains* (1982), a masterful overview of the evolving cultures of the Montagnards up to 1954, and *Free in the Forest* (1982), a scholarly description of the fate of the peoples of the central highlands from 1954 to 1976; and two studies by A. TERRY RAMBO, *A Comparison of Peasant Social Systems of Northern and Southern Viet-Nam* (1973), and "Vietnam: Searching for Integration," in CARLOS CALDAROLA (ed.), *Religions and Societies, Asia and the Middle East* (1982), pp. 407–444. NIGEL THRIFT and DEAN FORBES, *The Price of War: Urbanization in Vietnam, 1954–85* (1986); VO NHAN TRI, *Vietnam's Economic Policy Since 1975* (1990); and MELANIE BERESFORD, *Vietnam: Politics, Economics, and Society* (1988), are useful studies on these topics. (N.L.J.)

KEITH WELLER TAYLOR, *The Birth of Vietnam* (1983), is the definitive treatment of early history to the 10th century. JOSEPH BUTTINGER, *The Smaller Dragon: A Political History of Vietnam* (1958, reissued 1966), is the standard history from the rise of the Vietnamese state to the colonial era. THOMAS HODGKIN, *Vietnam* (1981), recounts in detail the background of the Vietnamese revolutionary struggle. ALEXANDER B. WOODSIDE, *Vietnam and the Chinese Model* (1971, reprinted 1988), analyzes 19th-century Vietnamese society. DAVID G. MARR, *Vietnamese Anticolonialism, 1885–1925* (1971), is a sensitive account, while his *Vietnamese Tradition on Trial, 1920–1945* (1981), explores the social and intellectual changes taking place under colonial rule. MILTON E. OSBORNE, *The French Presence in Cochinchina and Cambodia* (1969), analyzes French policies during the first stages of colonial rule. ALEXANDER B. WOODSIDE, *Community and Revolution in Modern Vietnam* (1976), argues that the search for community is a key factor in the Vietnamese revolution. HUYNH KIM KHANH, *Vietnamese Communism, 1925–1945* (1982), is the definitive account of the rise of the Vietnamese communist movement. ELLEN HAMMER, *The Struggle for Indochina* (1954, reissued 1969), dramatically treats the final stages of French rule. WILLIAM J. DUIKER, *The Communist Road to Power in Vietnam* (1981), is a historical study of the evolution of Vietnamese communist strategy. BERNARD B. FALL, *The Two Viet-Nams,* 2nd rev. ed. (1967), dated but still useful, examines the period after the division of the country. STANLEY KARNOW, *Vietnam: A History,* rev. and updated ed. (1991), is the companion volume to the PBS film series on the Vietnam War. DOUGLAS PIKE, *Viet Cong: The Organization and Techniques of the National Liberation Front of South Vietnam* (1966), is the classic analysis of communist techniques during the war; while TRUONG NHU TANG, DAVID CHANOFF, and DOAN VAN TOAI, *A Viet Cong Memoir* (1985, also published as *Journal of a Viet Cong,* 1986), is a firsthand account of the organization. KEN POST, *Revolution, Socialism, and Nationalism in Viet Nam,* 4 vol. (1989–92), is a Marxist interpretation of the Vietnamese revolution. JEFFREY RACE, *War Comes to Long An* (1972), discusses the factors behind the communist insurgency in South Vietnam, viewed from a single province. WILLIAM J. DUIKER, *Vietnam Since the Fall of Saigon,* updated ed. (1989), chronicles Hanoi's domestic and foreign policies since the end of the war. ROBERT SHAPLEN, *Bitter Victory* (1986), provides a journalistic account of Hanoi's problems in winning the peace since the end of the war. (W.J.D.)

Southeast Asian Arts

The term Southeast Asia refers to the huge peninsula of Indochina and the extensive archipelago of what is sometimes called the East Indies. The region can be subdivided into mainland Southeast Asia and insular Southeast Asia. The political units contained in this region are Burma, Thailand, Laos, Kampuchea (Cambodia), Vietnam, Malaysia, Singapore, Indonesia, and the Philippines. The Philippines originally was not included, because Philippine history has not followed the general historical pattern of Southeast Asia, but, because of its geographic position and the close affinities of its primitive cultures with the primitive cultures of Southeast Asia, it is now usually regarded as the eastern fringe of Southeast Asia. A common geographic and climatic pattern prevails over all of Southeast Asia and has resulted in a particular pattern of settlement and cultural development. Mountain people generally have a cultural level less developed than that of the valley dwellers. As a consequence, Southeast Asia is culturally fragmented. (For a discussion of the traditional cultures of the area, see ASIAN PEOPLES AND CULTURES: *Southeast Asian cultures.*)

The cultural setting of Southeast Asian arts

Southeast Asia has been the crossroads of many races who have been contending against each other for centuries. At present, all the peoples of Southeast Asia are Mongoloid in racial origin. The first to come were the Austronesians (Malayo-Polynesians), sometimes described as Proto-Malays and Deutero-Malays. At one time they occupied the eastern half of mainland Southeast Asia, but later they were pushed toward the south and the islands by the Austro-Asiatics. At present, peoples of Austronesian origin occupy Malaysia, the Republic of Indonesia, and the Republic of the Philippines. There were three main Austro-Asiatic races, the Mons, the Khmers, and the Viet-Muong. The Mons were at one time dominant, but they lost their racial identity in the 18th century and became absorbed by the Burmese and the Tais; only a few thousand Mons are now found living near the Burma–Thailand border. The Khmers from the 9th century to the 15th built a great empire, but much of its territory was lost to its neighbours so that only the small kingdom of Cambodia remains today. The Viet-Muong now occupy Vietnam. A Tibeto-Burmese tribe, the Pyu, founded an empire of city-kingdoms in the Irrawaddy Valley in the early centuries of the Christian Era, but the Pyu disappeared, and the Burmese, taking the leadership, founded their kingdom of Pagan and have occupied Burma up to the present day. In the 13th century the Tai-Shan lost their kingdom of Nan-chao in Yunnan, China, and entered the Mae Nam Chao Phraya Valley to found kingdoms that gradually evolved into the kingdoms of Siam (Thailand) and Laos.

EXTERNAL INFLUENCES

The Indian influence

In Southeast Asia, winds of change often came as storms. Indian commerce expanded into Southeast Asia in the early centuries of the Christian Era and, in spite of its peaceful nature, caused revolutionary changes in the life and culture of the peoples of the region. The Indians would sojourn in the region in small numbers for two or three monsoons only. The success of their commercial venture and the safety of their persons depended entirely on the goodwill of the inhabitants. At that time, the Indians were at a higher level of culture, and they brought new ideas and new art traditions. Since these ideas had some affinity with indigenous ideas and art forms, the natives, who had already reached a high level of culture themselves, accepted them but were not overwhelmed by an influx of new traditions. The Hindu-Buddhist culture of the Indians made a tremendous impact and came to form the second layer of culture in Southeast Asia, but the first layer of native ideas and traditions has remained strong to the present day.

European influence

Changes often came to Southeast Asia, usually because it possessed a commodity that was in great demand by the rest of the world. The Indians came because they were looking for fresh sources of gold after the Roman imperial source had run dry. In the 15th, 16th, and the 17th centuries, insular Southeast Asia attracted Islāmic merchants from India and farther west and later the Portuguese and the Dutch as a rich source of spices. As with the Hindu–Buddhist merchants of the past, the Islāmic traders came not as missionaries, though they did spread their religion in the region. The Portuguese came as conquerors and as militant missionaries of their Roman Catholic form of Christianity, and, for those reasons, their cultural traditions were found unacceptable to the natives. In the 17th century the Dutch came as conquerors and colonists for whom the attraction was first spices and then coffee, rubber, and petroleum. Since mainland Southeast Asia produced no spices for export, it was less vulnerable to the navies of Portugal and the Netherlands, so the region was not greatly affected by the Muslims, Portuguese, and Dutch. In the 19th century, Britain and France became interested in mainland Southeast Asia as the back door to China and sought to possess it as a colony. By the end of the 19th century, Burma had fallen to Britain, Siam was allowed to retain its independence only with the tacit permission of the two powers, and the rest had fallen to France. When in the mid-20th century the whole of Southeast Asia became free again, it was found that the arts of the peoples had remained merely static during the years of colonial rule; in some regions they had been driven underground by long neglect, but European culture and European art forms had made only a small impact.

INDIGENOUS TRADITIONS

The peoples of Southeast Asia were once thought to have shared a lack of inventiveness since prehistoric times and to have been "receptive" rather than "creative" in their contacts with foreign civilizations. Later excavations and discoveries in Burma and Thailand, however, inspired some scholars to argue against the accepted theory that

civilization came to Southeast Asia from China in prehistoric times; rather, these scholars contend, the peoples of mainland Southeast Asia were cultivating plants, making pottery, and working in bronze about the same time as the peoples of the ancient Middle East, and therefore civilization spread from mainland Southeast Asia to China and India. Southeast Asians have never produced any theory of art or literary or dramatic criticism, for they are always more concerned with doing the actual work of producing beautiful things. Because the Southeast Asians, especially in the western half of the mainland, worked on nondurable materials, it is not possible to trace the development and evolution of art forms stage by stage. The region has always been thickly forested, so it was natural that the first material to be used for artistic purposes should have been wood. The wood-carving tradition, begun in primitive times, was retained even when they learned to work with metals and with stone and continued to flourish long after the great age of stone sculpture and stone architecture, which ended in the 13th century. Proto-Neolithic paintings discovered in a cave near the Salween River in the western Shan state of Burma have very close affinity with the later carvings on posts of houses among the Nāgas on the western hills of Burma. Similarly, cave paintings of a pair of human hands with open palms, one holding the sun and the other holding a human skull, are reflected in the later aesthetic tradition of Southeast Asia: the sun symbol is found as an art motif all over the region, and a suggestion of awe, triumph, and joy at acquiring a human head is found in carvings under the eaves of the Nāga houses. The cave painting testifies to the continuity of the magico-religious tradition connected with all the arts of the area.

The art of casting the bronze drums found at Dong Son, near Hanoi, which are similar to the bronze drums used by mountain tribes throughout Southeast Asia, was thought to have come from China, but recent excavations in Thailand proved that the drums and the so-called Dong Son culture itself are native to mainland Southeast Asia. In any case, the continuity of the aesthetic tradition of Southeast Asia can be seen in the bronze drums that were cast by the Karens of Burma for centuries until the early years of the 20th century. The mountains of mainland Southeast Asia provided gold, silver, and other metals, and the art of metalworking must have developed quite early. Silver buttons, belts, and ornaments now made and worn by the hill peoples in Southeast Asia have behind them a very ancient tradition of workmanship. The same artistic tradition is found in textile designs.

Music, dance, and song were originally associated with tribal rituals. From the beginning, the main characteristic of Southeast Asian music and dance has been a swift rhythm. The slow and stately dances of the Siamese court were of Indian origin; when they were introduced into Burma in the 16th century, the Burmese quickened the tempo, but, even with that modification, the dances were still called Siamese dances to distinguish them from the native ones. In their oral literature—namely, in folk songs and folktales—the emphasis is on gaiety and humour. Typically, Southeast Asians do not like an unhappy ending.

The role of royal patronage and religious institutions. In all the regions of Southeast Asia, the arts flourished under the patronage of the kings. About the time of the birth of Christ, tribal groups gradually organized themselves, after some years of settled life as rice cultivators, into city-kingdoms, or conglomerations of villages. A king was thus little more than a paramount tribal chieftain. Since the tribes had been accustomed to worshipping local spirits, the kings sought a new spirit that would be worshipped by the whole community. One reason why the gods of Hinduism and Buddhism were found so readily acceptable to Southeast Asia was this need for new national gods. The propagation of the new religions was the task of the kings, and consequently the period from the 1st to the 13th century was a great age of temple building all over Southeast Asia. Architecture, sculpture, and painting on the temple walls were the arts that flourished. In the ancient empires of eastern Indochina and the islands, scholars of Sanskrit, the language of the sacred works of Hinduism, became part of the king's court, producing a local Sanskrit literature of their own. This literary activity was confined to the hereditary nobility and never reached the people, except in stories from the great Hindu epics *Mahābhārata* and *Rāmāyaṇa*. Because the Hindu religious writings in Sanskrit were beyond the reach of the common people, Hinduism had to be explained to them by Hindu stories of gods and demons and mighty men. On the other side of the peninsula, in the Pyu-Burmese empire of Prome, which flourished before the 8th century, there was no such development—first, because Hinduism was never widely accepted in Burma and, second, because the more open Burmese society developed neither the institution of a god-king nor that of a hereditary nobility. Although Pāli scholars surrounded the king in later Pagan, Pāli studies were pursued not at the court but at monasteries throughout the kingdom so that even the humblest villager had some faint contact with Pāli teachings. While the courts of the kings in Cambodia and Java remained merely local centres of Sanskrit scholarship, Pagan became a centre of Pāli learning for Buddhist monks and scholars even from other lands. As in the case of stories from the Indian epics, stories of the *Jātakas* (birth stories of the Buddha) were used to explain Buddhism to the common people, who could not read the scriptures written in Pāli. Just as scenes from the great epics in carving or in fresco adorned the temples in Cambodia and Java, scenes from the *Jātakas* adorned the Pagan temples.

Sanskrit and Pāli literature

Musicians of the Pyu kingdom played before the Emperor of China in 801, and the various musical instruments at the performance have their counterparts at the present day, not only in Burma but throughout Southeast Asia. At Pagan the people were so fond of music that even the collection of taxes became an occasion to dance and sing, and a royal official, endowing a temple, inscribed a prayer asking that in all his future existences until he reached Nirvāṇa "might he be woken up every morning to the strains of music sweetly played on flute and violin." In spite of this love for music and dance, no dramatic art seems to have developed in Burma, perhaps because Sanskrit, in which there was a dramatic tradition, was not studied. In contrast, at the courts of Cambodia and Java, the Sanskrit drama, Hindu dances, and native dance traditions combined and produced the court opera ballets. These dramatic elements later reached the common people by way of the shadow play.

The patronage of the king and the religious enthusiasm of the common people could not have produced the great temples without the enormous wealth that suddenly became available in the region following the commercial expansion. With the Khmer and Javanese empires, the wealth was produced by a feudalistic society, and so the temples were built by the riches of the king and his nobles, combined with the compulsory labour of their peasants and slaves, who probably derived some aesthetic pleasure from their work because of their religious fervour. Nonetheless, their monuments, such as Borobuḍur, in Java, and Angkor Wat, in Cambodia, had an atmosphere of massive, all-conquering power. At Pagan, where wealth was shared by the king, the royal officials, and the common people, the temples and the monasteries were built by all who had enough not only to pay the artisans their wages but also to guarantee their good health, comfort, and safety during the actual construction. The temples were dedicated for use by all monks and lay people as places of worship, meditation, and study, and the kings of Pagan did not build a single tomb for themselves. The Khmer temple of Angkor Wat and the Indonesian temple of Borobuḍur were tombs in that the ashes of the builders would be enshrined therein; the kings left stone statues representing them as gods for posterity to worship, whereas at Pagan there was only one statue of a king, and it depicted him on his knees with his hands raised in supplication to the Buddha. Consequently, the atmosphere that pervaded the temples of Pagan was one of joy and tranquillity.

Significance of the temples

This golden age of wealth and splendour in Southeast Asia ended in the 13th century with a sudden violence, when Kublai Khan's Tatar Chinese armies destroyed both the Burmese and the Khmer empires and his navy attacked Vietnam and Java. The tiny kingdoms that subsequently

sprang up all over Southeast Asia continually fought among themselves; their kings were neither powerful nor rich, and the royal courts became centres of military planning and political intrigue. During the 13th and 14th centuries, in the new Javanese kingdom of Majapahit and the new Burmese kingdom of Ava, vernacular literatures came into being. Again, differences in social structure had aesthetic repercussions. In Majapahit the king was powerful and gave his patronage to the newly arisen literature, confining it to the court. At Ava the vernacular literature bloomed throughout the kingdom, and the king, lacking power and prestige, prevailed upon some established writers to join the court circles and give them glamour.

After Majapahit, a new cultural force—namely, Islām—reached insular Southeast Asia, and over the two layers of primitive and Hindu-Buddhist cultures was added the third layer of Islām. In mainland Southeast Asia, a new Burmese empire arose over the ruins of the old and continued its task of spreading Buddhism. Hindu tradition reached the Burmese court secondhand in the 18th century as the result of the Burmese conquest of Siam and was one of the factors that contributed to the rise of a Burmese drama. On the other side of the peninsula, Vietnam, reconquered by China, fell more and more under the influence of Chinese culture. After a short period of Islāmic bloom, native culture in insular Southeast Asia was subjected to alien rule. In Burma and Siam alone among the states of Southeast Asia, native arts continued to flourish because, after centuries of warfare, they finally emerged as strong kingdoms.

Predominant artistic themes. The predominant themes of Southeast Asian arts have been religion and national history. In religion the main interest was not so much in actual doctrine but in the life and personality of the Buddha and the personalities and lives of the Hindu gods. In national history the interest was in the legendary heroes of the past, and this theme appeared only after the great empires had fallen and the memories of their glory and power remained. The Buddha image, which went through various stages of development, remained the favourite motif of sculpture and painting. The depiction of scenes from his previous lives in fresco and relief sculpture also had the purpose of teaching the Buddhist ethics to the people, as the *Jātaka*s emphasized certain moral virtues of the Buddha in his previous lives; it also gave an opportunity to the artist to introduce local colour by using, as background, scenes from his own contemporary time. The depiction of scenes from the Hindu epics also had the same purpose and gave the same opportunity to the artist. Many figures from the Buddhist and Hindu scriptures, such as gods and goddesses, heroes and princesses, hermits and magicians, demons and dragons, flying horses and winged maidens, became fused with similar native figures, and, gradually, folklore plots became merged in the general religious themes.

The *nāgas*

The *nāga*, a superhuman spirit, was taken from Buddhist and Hindu texts and merged with native counterparts, with the result that different images of the *nāga* appeared in various regions. The Burmese *nāga* was a snake with a crested head. The Mon *nāga* was a crocodile, and the Khmer and Indonesian *nāga* was conceived as a nine-headed snake. The demons of various kinds from all over Southeast Asia became merged under one name of Pāli-Sanskrit origin, *yakkha* or *yakṣa*, but they retained their separate identities in sculpture and paintings of their own different countries. The lion, which was unknown to the monsoon forest but was a figure of Hindu and Buddhist mythology, evolved into a native symbol and art motif. The primitive worship of the snake-dragon as a god of fertility was retained in the Khmer Empire; the nine-headed *nāga* became a symbol of security and of royalty, and stone *nāga*s guarded the palaces and temples. Buddhism frowned upon *nāga* worship. In Burmese and Mon sculpture the *nāga* was always shown as a servant of the Buddha, putting his body in coils to make a seat for his master and raising his great hood as an umbrella over his master's head. According to tradition, the guardian figure of a Mon temple was a two-bodied lion with a man's head, and the guardian figure of a Burmese temple was the crested lion. The Tais made themselves heirs to both the Khmer and the Mon art traditions relating to the *nāga*, but the guardian figure of their temples was the benevolent demon.

Primitive symbols and animal imagery merged with Indian animals and entered the arts. The Pyus embossed the primitive symbol of the sun on their coins as insignia of their power, and the Burmese transformed it into their favourite bird, the peacock, on the excuse that Buddhist mythology associated the peacock with the sun; the Mons adopted the red sheldrake as their symbol, and in Indonesia the mythical bird called Garuḍa, the vehicle of Vishnu, became merged with the local eagle. The figures of these birds also became decorative motifs. Animals of the Southeast Asian forests whose figures had adorned primitive dwellings of wood and thatch were stylized and came to adorn palaces and monasteries. Primitive geometrical patterns mixed with new spirals and curves from India, and Indian floral designs merged with those of trees and fruits and flowers copied from the monsoon forests.

THE UNIQUE AESTHETIC OF THE REGION

The arts of Southeast Asia have no affinity with the arts of other areas, except India. Burma was always an important route to China, but Burmese arts showed very little Chinese influence. The Tais, coming late into Southeast Asia, brought with them some Chinese artistic traditions, but they soon shed them in favour of the Khmer and Mon traditions, and the only indications of their earlier contact with Chinese arts were in the style of their temples, especially the tapering roof, and in their lacquer ware. Vietnam was a province of China for 1,000 years, and its arts were Chinese. The Hindu archaeological remains in southern Vietnam belong to the ancient kingdom of Champa, which Vietnam conquered in the 15th century. The Buddhist statues in northern Vietnam were Chinese Buddhist in style. The essential differences in aesthetic aim and style between the arts of East Asia and those of Southeast Asia could be seen in the contrast between the emperors' tombs of Vietnam and the temple-tombs of Cambodia and Indonesia or the opulent and dignified Buddha images of Vietnam and the ascetic and graceful Buddha images of Cambodia and Burma. Islāmic art, with its rejection of animal and human figures and its striving to express the reality behind the false beauty of the mundane world, also has no affinity with Southeast Asian arts. Both Hinduism and Buddhism taught that the sensual world was false and transitory, but this message found no place in the arts of Southeast Asia. The world depicted in Southeast Asian arts was a mixture of realism and fantasy, and the all-pervading atmosphere was a joyous acceptance of life. It has been pointed out that Khmer and Indonesian classical arts were concerned with depicting the life of the gods, but to the Southeast Asian mind the life of the gods was the life of the peoples themselves—joyous, earthy, yet divine. The European theory of "art for art's sake" found no echo in Southeast Asian arts, nor did the European division into secular and religious arts. The figures tattooed on a Burmese man's thigh were the same figures that adorned a great temple and decorated a lacquer tray. Unlike the European artist, the Southeast Asian did not need models, for he did not strive to be realistic and correct in every anatomical detail. This intrusion of fantasy and this insistence on the joyousness of human life have made Southeast Asian arts unique.

Literature

GENERAL CONSIDERATIONS

Regional distinctions. From the point of view of its "classical" literatures, Southeast Asia can be divided into three major regions: (1) the Sanskrit region of Cambodia and Indonesia; (2) the region of Burma where Pāli, a dialect related to Sanskrit, was used as a literary and religious language; and (3) the Chinese region of Vietnam.

There are no examples of Chinese literature written in Vietnam while it was under Chinese rule (111 BC–AD 939); there are only scattered examples of Sanskrit inscriptions written in Cambodia and Indonesia; yet most of the

literary works produced at the court of Pagan in Burma (flourished *c.* 1049–1300) have survived because the texts were copied and recopied by monks and students. But in the 14th–15th centuries, vernacular literatures suddenly emerged in Burma and Java, and a "national" literature appeared in Vietnam. The reasons behind the development of each were the same: a feeling of nationalistic pride at the final defeat of Kublai Khan's invasions, the desire of the people to find solace in literature amidst change and struggles for power, and the lack of wealth and patronage to channel artistic expression into building temples and tombs. In Vietnam and Java literary activity centred on the courts; but in Burma the first writers were the monks and, later, the laymen educated in their monasteries. In the new Burmese kingdom of Ava (flourished after 1364), the Shan kings were proud of their Burmese Buddhist culture, and they appointed the new writers into royal service, with the result that courtiers became writers also. The Tai kings of Laos and Siam led their courts in learning Pāli from the Mons, whom they had conquered, and Sanskrit from the Khmers, whom they harassed; nevertheless, seized with national pride and influenced by the Burmese example, they developed their own vernacular literature. But Cambodia itself declined. Although the monks in the Theravāda Buddhist (*i.e.*, the Southeast Asian form of Buddhism) monasteries produced a few works in Pāli, no vernacular literature emerged until finally Khmer-speaking people (those living in the area comprised approximately of modern Kampuchea) were borrowing many words from the Tais.

For its vernacular literatures, Southeast Asia can be divided into (1) Burma; (2) Thailand, Laos, and Cambodia; (3) Vietnam; (4) Malaysia and Indonesia; and (5) the Philippines (which produced a vernacular literature only in the 20th century, after the imposed Spanish and English languages and literatures had made their impact).

The era of royal patronage

Prestige of the writer. During the time of the kings, a Southeast Asian writer enjoyed patronage and a prestigious position in society. He could not, however, make a living by writing as a profession. Manuscripts had to be written by hand, and only in the case of famous works might one or two duplicates be made, again by hand. There was no question of selling the manuscript. A writer could only hope to attract the notice of his king and obtain a monetary reward or a royal office. By the time that printing presses were introduced, in the colonial period in the 19th century, the kings were gone and with them their writers. Colonial rule overwhelmed and destroyed vernacular literary traditions, leaving intact only oral literatures in the forms of folktales and folk songs. Literary criticism, as understood in Western cultures, had never been known, either in the ancient or modern literatures of Southeast Asia. Apart from a few stray writings on versification, therefore, no works of literary criticism or literary history existed until the colonial period. Even then, the interest of European scholars was chiefly confined to archaeology, and only a few made the attempt to study some special type or period of a vernacular literature (for example, vernacular versions of the *Rāmāyaṇa*, the great Sanskrit epic of India, or of 14th-century Javanese verse). There is a work in French dealing with Thai literature and a work in Burmese dealing with Burmese literature; but apart from these no study of any Southeast Asian literature as a whole has yet been made. For this neglect, native scholars are much to blame. Works on literary criticism and the history of literature would help give perspective to indigenous writers in the 20th century, both to those who want to cling to their native traditions (as is the case with writers in Burma and Thailand) and those who want to make a complete break with the past (as is generally the case in Vietnam, Indonesia, and Malaysia).

PRE-EUROPEAN COLONIAL PERIOD

Burma. The Burmese borrowed many words from Pāli but not to the extent that the Indonesians, Khmers, and the Thais borrowed Sanskrit words. The Burmese language was monosyllabic and tonal, and since there was no accent or stress, the feature that distinguished verse from prose was the regular occurrence of rhyme. They modelled their literature not on classic examples from Pāli or Sanskrit but on their own traditional folk songs.

The 15th century. In the 15th century, four types of verse existed: (1) *pyo* (religious verse), which retold stories of Buddha's birth and teaching and were taken from the *Jātaka*s (a collection of folktales adapted to Buddhist purposes and incorporated into the Pāli canon), to which were added imaginative details and a Burmese background; (2) *linkar* (shorter religious verse), or a devotional poem, characterized by a metaphysical flavour comparable in many ways to that which informs the work of the early 17th-century English poets George Herbert and Robert Herrick; (3) *mawgoon* (historical verse), half ode, half epic, written in praise of a king or prince and developing out of military marching songs; (4) *ayegyin* (lullaby), an informative poem usually addressed to a young prince or princess and written in praise of his royal ancestors.

Literature in the 15th century is dominated by three monks: Shin Maha Rahta Thara, who wrote for the court of Ava, and Shin Maha Thila Wuntha and Shin Uttamagyaw, both of whom were of village stock and did not go to court but remained on in their village monasteries. Shin Maha Thila Wuntha, in the closing years of his life, turned to prose and wrote a chronicle history of Buddhism. In this period several courtiers, both men and women, also began to achieve some literary success, and the genre called *myittaza* (epistle) first evolved, which is a long prose letter written by a monk and addressed to the king to advise him of his duties.

Poets at court

The 16th century. In the 16th century, the Burmese conquered Siam, and their subsequent knowledge of Thai romantic poems gave rise to a new verse form called the *yadu* (the seasons). They borrowed only the theme, however, and not the form, and they developed it as an emotional poem, passionate, yet with something of the cool intellectual strength of the poems of the English metaphysical poets John Donne and Andrew Marvell. The most famous writers of the *yadu* were two court poets, Phyu and Nyo; a general of the army called Nawaday; and Natshinnaung, king of Toungoo. The wide popularity of the poems eventually gave rise to a mock-heroic form called *yagan* ("Kick the *yadu*").

Golden age of literature. In the early years of the 18th century, U Kala compiled a history of Burma, written in precise and clear prose; the closing years, which coincided with the establishment of the third Burmese Empire, saw a great period of literature. The Thai court, brought as captives to the Burmese capital, introduced to the Burmese poetic romances and their *Rāma* play (based on the *Rāmāyaṇa*). Contact with the Thais stimulated the growth of a Burmese court drama and led to the appearance of Burmese court romances in poetic prose. The king's treasurer, however, made fun of the Thai importations and wrote the *Rama Yagan*, in which the high romance and courtly elegance of the 4th-century-BC *Rāmāyaṇa* ("The Life of Rāma") were given a rustic setting, with hilarious results. From the quiet of their monasteries, the monk Awbatha wrote novel-like rendering of the *Ten Long Jātakas* and the monk Kyeegan Shingyi wrote homely, pithy, and sometimes even humorous myittaza ("epistles") from villagers to their relations in the cities.

The defeat suffered by the Burmese in the Anglo-Burmese War of 1824–26—their first defeat since the time of Kublai Khan in the 13th century—introduced a note of melancholy to Burmese literature. During this first half of the 19th century, many of the new melancholy lyrics were set to music. Two great writers were a product of this period: the dramatist U Kyin U and the courtier U Pon Nya, the greatest writer of the time, whose plays, epistles, and songs are full of humour and zest for life.

Thailand. Until 1824 Thai literature was entirely the province of the king and his court: the king maintained a corps of writers, and it was the custom to attribute authorship of any literary work to the king himself. Thai vernacular literature began with verse, based on Sanskrit models but relying on an elaborate rhyme scheme because the

Elaborate rhyme scheme of Thai poetry

Siamese language was tonal. The two earliest known poems were *Yoon Pai* ("The Defeat of the Yoons"), an epic-ode having similarities to the Burmese *mawgoon* genre, and *Mahajati* ("The Great *Jātaka*"), a poem stressing ethical ideas, similar in form to the Burmese *pyo*. Both poems, written during the period 1475–85, give ample proof that Thai writers, using Sanskrit, Khmer, and Burmese models, could nonetheless produce a truly Thai work.

First golden age: King Narai (1657–88). All literary activity ceased in the 16th century because of the unsettled conditions that prevailed before and after the annexation of the country by the Burmese. Independence was regained toward the close of the century, and under King Narai (1657–88), at his court in Ayutthaya, Siamese literature achieved its first golden age. Narai was himself a great poet, and during his reign new verse forms were evolved. He wrote poetic romances, based on stories from the "Fifty Jātakas," which were in fact folktales belonging to the region retold in Pāli and disguised as *Jātaka*s by an unknown Tai monk. Narai also wrote the final version of the poem of tragic romance, *Pra Lo* ("Lord Lo"), which had first been composed by an anonymous author in a much earlier reign. Among courtier poets of this time, the most famous were Maharajaguru; Si Prat, a wild young gallant who wrote the romantic poem *Aniruddha* (the name of the hero of the poem) and some passionate love songs; Khun Devakavi, author of cradle-songs using many Sanskrit and Khmer words but modelled on the Burmese *ayegyin;* and Si Mahosot, the author of an ode-epic in praise of King Narai. A new genre, the travel poem, also became popular; and the first versions of the plays *Rāma* and *Inao* (based on Hindu–Khmer–Javanese models) were composed by the King and his corps of writers. Perhaps the only prose work of the period was the *History of Ayutthaya* by Luang Prasroeth, which was lost and came to light only in the 20th century. It showed some signs of being influenced by U Kala's *History* (of Burma).

Second golden age: King Rama II (1809–24). Siam was conquered by the Burmese in 1767, and a new dynasty was established in a new capital, Bangkok. Some effort was made to revive the country's culture, largely destroyed following the sack of the old capital of Ayutthaya; and under the poet-king Rama II a second golden age of Thai literature occurred, during which women achieved prominence as poets for the first time. The King, with his writers, composed the final versions of *Rāma* and *Inao* and also a popular romance, "Khun Chang and Khun Pen," based on an incident in Thai history. The most famous poets were Prince Paramanuchit, whose ode-epic *Taleng Phai* ("The Defeat of the Mons") testified to his greatness, and Sunthon Phu, the King's private secretary, who was born of humble parents but made his way in the court by the excellence of his poetry. A strongly religious king, Rama III disbanded the corps of writers and discouraged the performance of plays at his court. Sunthon Phu lost his position but wrote his most famous poem, *Phra Aphaimani,* away from the court. A long fantasy-romance, this work can be regarded as the end of court domination in literature. Further, a royal official composed a Thai translation in prose (*Sam Kok*) of the Chinese classic *Romance of the Three Kingdoms.* The author, Pra Klang, was admittedly a royal official; nevertheless, the work was meant for the people rather than the court. It was followed by a spate of imitations and finally resulted in the development of the historical novel.

Final version of *Rāma*

Laos, Cambodia, and Vietnam. Laotian literature was in many respects a dialect branch of Tai literature, and, as in Thailand, it was the creation of the royal court. A number of popular romantic poems and prose lives of famous monks were composed, but their authors were unknown; all works, in fact, were by custom written anonymously.

The kings of Cambodia, fallen from high estate and often mere vassals of Thailand, could not inspire the rise of a vernacular literature. Only in the monasteries was there any literary activity, and this was written in the Pāli language.

In Vietnam, the emperors of the Tran dynasty (13th–14th century) were themselves poets and patronized a new literature—which, nevertheless, was still written in Chinese and was therefore national rather than vernacular. The writings themselves, however, were by no means a mere branch of Chinese literature. The country was afterward conquered once more by China and it was not until it regained independence that, under the patronage of the Le dynasty emperors (15th–16th century), a new age of literature began. Although the Chinese language was still used, some writers were beginning to use the vernacular (employing Chu-nom script, consisting of modified Chinese characters). Nguyen Trai, Emperor Le Thanh Tong, and Nguyen Binh Khiem were the great poets of this period. In 1651 Father Alexandre de Rhodes, a Roman Catholic missionary priest, invented a new romanized script (Quoc-ngu) that became the national script. Literature then began to reach the common people.

The national script

Literary works written before the end of the 18th century have not survived; the best known are those written in the 19th century, before the country became a French colony in 1862. Ho Xuan Huong, Nguyen Cong Tru, Chu Manh Trinh, and Tran Ke Xuong were famous court poets. Nguyen Du (1765–1820) wrote moral tales in verse that appealed not only to the court but to the common people. His most famous work was *Kim Van Kieu,* a poem of 3,253 lines, showing a strong Chinese influence (the plot was taken from a Chinese historical novel, and its ethical basis was both Confucian and Chinese Buddhist). The plays of the period, although written in Vietnamese, followed Chinese dramatic traditions because the Vietnamese theatre was still Chinese in style and practice.

Malaysia and Indonesia. Malaysia and Indonesia together have about 300 different languages and dialects, but they have a single common linguistic ancestor. Before the coming of Islām to the region in the 14th century, Javanese had been the language of culture; afterward, during the Islāmic period, Malay became the most important language—and still more so under later Dutch colonial rule so that, logically, it was recognized in 1949 as the official Indonesian language by the newly independent Republic of Indonesia.

During the period of Indian cultural influence, Sanskrit flourished in the great empires that included both the Malay Peninsula and the islands of present-day Indonesia. In the 11th century, at the court of Emperor Airlangga, a national literature (as distinct from a vernacular literature) emerged. It was written in courtly Javanese mixed with Sanskrit words, and it used Sanskrit metres and poetic style. In the 14th century in Majapahit (the new Javanese Empire that had been established after the final defeat of Kublai Khan's forces) a vernacular literature based on the speech of the common people came into being. The most important work of this new literature was *Nāgarakertāgama* (1365), a long poem in praise of the king (though it was not a product of the court) that also contained descriptions of the life of the Javanese people at the time. Although it employed a number of Sanskrit words, the style and metre were Javanese, not Sanskrit.

The Indian Hindu epics had already been popularized in the Malay Peninsula and in the islands of Indonesia (by way of the shadow-puppet play), and in this period fresh versions began to be written in the new Javanese. Romances, called *hikayat,* both in verse and in prose, also appeared—having as their source native myth and legend. Soon Malay, Balinese, Sundanese, and Madurese vernacular literatures emerged, all dealing with the same themes.

Romance themes from myth and legend

The coming of Islām coincided with the rise of Malacca and the decay of Majapahit; but the popular fantasy-romances were able to survive by adopting a Muslim, instead of a Hindu, guise. New romances, telling the stories of heroes known to Islām, such as Alexander the Great, Amīr Ḥamzah, and Muḥammad ibn al-Ḥanafiah, were added to their number, and translations of Persian Muslim stories and of works on Muslim law, ethics, and mysticism further enriched Malay literature.

The finest work of all in the Malay language was the *Malay Annals,* written in about the 15th century. It gave a romanticized account of the history of the kingdom of Malacca and a vivid picture of life in the kingdom. Although a court record that begins with ancestral myths, it goes on to describe latter-day events of the kingdom with realism and humour.

In the Malay Peninsula, the coming of colonial rule did not at once overwhelm the existing native literature. As at the courts of the sultans of the British federated Malay states, the old traditions continued for some time. In Indonesia, however, a complete break was made with the cultural tradition.

EUROPEAN COLONIAL AND MODERN PERIODS

Impact of colonial rule

The entire region of Southeast Asia, with the single exception of Thailand, fell under colonial rule, and Thailand itself survived more as a buffer state than as a truly independent kingdom. At the courts of the kings of Laos, Cambodia, and Vietnam, which fell under French suzerainty, and in the palaces of the sultans of the British Malay states, vernacular literatures managed to survive for a time; but since these literatures had long ago ceased to develop—as a result of harassment by the Thais in the case of Laos and Cambodia, by the Portuguese in the case of Malaya, and by the French in the case of Vietnam—they soon became moribund. In all of Southeast Asia, except Burma and Thailand, the vernacular languages themselves lost their status, as the languages of the colonial rulers became the languages of administration and of a new elite. A revival of interest in the native languages and literatures occurred only toward the close of the colonial period, as a consequence of national movements for freedom.

Burma. In Burma, unlike India and other parts of the British Empire, English did not fully replace Burmese as the language of administration. In the almost classless Burmese society the language of the court and of literature was also the language of the people, which prompted the British government to retain Burmese as a second official language and to make both languages compulsory for study in schools and colleges. As a result, no English-speaking elite emerged, English literature did not dazzle native scholars, and, although its growth was retarded, Burmese literature did not disappear. With the intensification of the movement for freedom, around 1920, political tracts, novels, short stories, and poems reflected a political bias against colonial rule. In 1930, at the University of Rangoon, a group of young writers developed a new style of Burmese prose and poetry, a style little influenced by Western literature. In the post-independence period, novels and poems became centred on biographical and historical writings.

Thailand. Administrative and educational reforms introduced by King Mongkut (1851–68) as an answer to the threat of colonial conquest created a liberal atmosphere and a new reading public, and soon many of the old courtly writings were popularized in the form of romantic prose fiction. About 1914, King Vajiravudh, a graduate of Cambridge University, attempted to win back for the palace the leadership in literature; although he produced some fine adaptations of Shakespeare's plays, they made no impact on the people, with whom romantic fiction remained popular. Because of increased contact with the West, after World War II novels and short stories based on western models began to rival the earlier prose romances.

Laos, Cambodia, and Vietnam. Because of France's restrictive colonial educational policy, French language and literature never reached the common people. Moreover, the French-speaking elite, engrossed in French literature, neglected the native literature. With the growing vehemence of the freedom movement in the 1930s, however, there developed in Vietnam a new school of vernacular poetry that was less traditional and more nationalistic. But in the turbulent years that followed, the poets, including Ho Chi Minh himself, became occupied more with war than with literature.

Malaysia and Indonesia. The first Malaysian newspaper in the vernacular language, which appeared in 1876, introduced a new style of prose, less literary and nearer to the spoken Malay. Becoming immensely popular, the new style was further developed by other newspapers. (Although the early innovators were influenced by the English language, their followers were influenced by Arabic.) In about 1920 this new "Malaysian Malay" finally replaced the old literary Malay. The Translation Bureau, established by the British government in 1926, translated a great number of English books into the new Malay. In Indonesia, also, the old cultural language, literary Javanese, ceased to be used; by the end of the 19th century young Indonesians, overwhelmed by Dutch literature, started to write in Dutch. For example, a young girl, Raden Adjeng Kartini, wrote in Dutch a remarkable series of letters, containing criticism of Indonesian society, that were later collected and published; and a group of young men wrote poems in Dutch, although with an Indonesian background. By about 1920, however, the Dutch government itself had decided for political reasons to discourage further development of a national literature in Dutch, and the nationalist leaders had become eager for a new literature in the native language. This common aim bore fruit in 1933, when a literary journal under the editorship of Takdir Alisjahbana appeared, containing poems and essays written by various authors in the new Malay, which they now called Indonesian. The editor himself later wrote in Indonesian a number of popular novels containing social criticism, which were imitated by other writers. During the Japanese occupation of Indonesia and Malaya, this new Indonesian literature became popular also in Malaya. The adoption of Bahasa Malay (Indonesian) as the official language of Indonesia in 1949 gave further impetus to the development of the vernacular literature in both countries. The new tradition developed after independence, and its outstanding writers in Indonesia were, in poetry, Chairil Anwar and Sitor Situmorang. Important novelists include Ananta Toer and Takdir Alisjahbana.

Malaysian Malay

The Philippines. Philippine literature had its beginnings in great epics that were handed down orally from generation to generation and sung on festive occasions. When the Philippines became part of the Spanish Empire in the 16th century, printing was introduced, and all the early published works in the vernacular (Tagalog) were of Christian religious subjects. Eventually, some individual romantic legends taken from the epics were published, but they had acquired a European flavour. An outstanding work in the early years of the 19th century was an epic romance called *Florante at Laura* by the first native writer to achieve prominence—Francisco Balagtas—who wrote in Tagalog. In the latter half of the 19th century, an intellectual renaissance coincided with the beginnings of a national movement toward freedom; writers began using Spanish, for their work was part of the nationalist propaganda. The most famous author was José Rizal, who wrote a series of brilliant social novels, beginning with *Noli me tangere* ("Touch Me Not"). Other prominent writers, all essayists, were Mariano Ponce and Rafael Palma. There were poets also—for example, José Palma, whose poem "Filipinas" was later adopted as the national anthem. After the United States had taken over the Philippines, Spanish was gradually replaced by English, and new writers began to use that language as their medium. But before a new national literature could evolve, World War II took a heavy toll of writers, and those who survived became caught up in the political changes that followed. Many still write in English—the Spanish tradition, too, remains strong—but more and more writers are turning to Tagalog for literary expression. (M.H.Au.)

19th-century intellectual renaissance

Music

GENERAL CHARACTERISTICS

Society and music. *Rural and urban music.* A general musical division exists between the urban and rural areas of Southeast Asia. Urban centres comprise the islands of Java and Bali and places in Thailand, Laos, Kampuchea, and Burma, where big ensembles of gong families play for court and state ceremonies. Rural areas include other islands and remote places, where smaller ensembles and solo instruments play a simpler music for village feasts, curing ceremonies, and daily activities. In cities and towns influenced by Hindu epics such as the *Rāmāyaṇa* and *Mahābhārata,* shadow and masked plays and dances utilizing music play important communal roles, while in less urbanized areas, in lieu of musical plays, chants and songs in spirit worship and rituals are sung in exclusive surroundings—a ritual procession on the headwaters of

Borneo, a drinking ceremony in the jungles of Palawan, a feast in the uplands of Luzon.

In both regions the physical setting is usually the open air—in temple yards and courtyards, under the shade of big trees, in house and public yards, fields and clearings. Many musical instruments are made of natural products of a tropical environment, and their sounds are products of this milieu. The music of buzzers, zithers, and harps is thus akin to sounds heard in the tropical vegetation of Southeast Asia. In Bali, for example, special ways of chanting and sounds of the jew's harp (also jaw's harp) ensemble (*genggong*) imitate the croaking of frogs and noise of animals.

Relation to social institutions. Music in Southeast Asia is frequently related to ceremonies connected with religion, the state, community festivals, and family affairs. In Java, important Islāmic feasts, such as the birthday of Muḥammad or the fast of Ramaḍān, as well as animistic ceremonies marking the harvest and cycles of human life, are celebrated with shadow plays (*wayang* [*wajang*]). In Bali, the *gamelan gong* orchestra opens ceremonies and provides most of the music for temple feasts. The *gamelan selunding,* an ensemble with iron-keyed metallophones (like xylophones but with metal keys), plays ritual music, and the *gamelan angklung,* so called because it formerly included tube rattles, or *angklung,* is used to accompany long processions to symbolic baths near the river.

In Malaya the court orchestra, or *nobat,* was held almost as sacred as the powers of the sultan himself. Among the Land Dayak and Iban in Borneo, ceremonial chants are sung in feasts related to rice planting, harvesting, and honouring the omen bird *kenyalang* and other spirits.

The relation of music to dance and theatre. In the Thai masked play, or *khon,* dancers, chorus, soloists, and orchestra are all coordinated. The musicians know the movements of classical dance and coordinate musical phrases with dance patterns, turns, and movements. In the shadow play, or *nang sbek,* the dancer, who manipulates a leather puppet, must keep his foot movements in time with vocal recitations. During pauses in which the gong ensemble plays an interlude, the dancer must change steps accordingly. In general, when there is solo singing, the instrumental ensemble remains silent or plays only a few instruments in contrast to interludes of acrobatic shows or scenes of fighting, when the full orchestra clangs on all the instruments. In Balinese dancing, body movements, paces, and directions are dependent on drum strokes and signals from a wood block (*keprak*) and cymbals (*tjengtjeng*). The dancers generally rehearse with the musicians to know exactly when choreographic changes take place.

Musicians' knowledge of the dance

As theatre, the stories of *Rāmāyaṇa* and *Mahābhārata* have different musical supports, depending on the country. In Bali, *Mahābhārata* shadow plays are presented to the accompaniment of a quartet of metallophones known as *gender wayang.* In Cambodia, where the preference is for stories of the *Rāmāyaṇa* (which is called *Ramker* in Cambodia), the music is a full gong ensemble similar to the Thai *pi phat* ensemble, while in Burma, a percussion orchestra of drums and gongs in circular frames accompanies singing, dancing, and dialogues in all types of plays.

Musical traditions and practice. *Vocal music.* The role of the voice in music making differs from that of European music in both concept and execution. Men's and women's voices are each not divided into high and low ranges but are used for their colour qualities. In the Javanese shadow play, for example, the narrator (*dalang*) assumes many singing and speaking qualities to depict different characters and scenes. Arjuna, the chief *wayang* hero, is represented with a clear voice, speaking in a single tone. Puppets with bigger bodies are given lower, resonant voices. In Thai masked plays there is no desire to produce full open tones, as in Italian bel canto. A vocal tension accounts for shades of "nasal" singing that can be discerned in commercial recordings of Thai, Javanese, Cambodian, and Vietnamese music. In the Javanese orchestra (gamelan) the voice tries to imitate the nasality of the two-stringed fiddle (*rebab*). In Bali, a particular use of men's voices is in the *ketjak,* a ritual in which groups seated in concentric circles combine markedly pronounced syllables into pulsing rhythmic phrases. In village settings among the Kalinga of Luzon, in the Philippines, singing, speaking, or whispering of vowels is so subtle as to blur the border line between speech and song. On the Indonesian island of Flores, leader–chorus singing, with the chorus divided into two or more parts, is accompanied by a prolonged note (drone) or by a repeated melodic, rhythmic fragment (ostinato). In Borneo, or Mindanao and Luzon in the Philippines, a man or woman may sing an epic or a love song in a natural voice with little or no attempt to nasalize it. Epic singing, with long or short melodic lines, goes on for several nights, and some of the sounds are mumbled to give words and their meanings a particular shading. Further, a sensuousness in the quality of Islāmic singing is achieved through the use of shades of vowel sounds, vocal openings, and a bell-like clarity of tones.

Voice quality and dramatic meaning

Instrumental music. Although gong orchestras consisting of gongs, metallophones, and xylophones bind Southeast Asia into one musical cultural group, the types of ensembles and sounds they form may be classified into four areas. Java and Bali make up one unit because of their predominant use of bronze instruments in orchestras that make one homogeneous sound. Thailand, Laos, and Cambodia form another subdivision, with families of musical instruments producing heterogeneous sounds: the bronze group makes slowly decaying sounds, wooden xylophones play short sounds, and a reed blows a penetrating melody accompanied by a fourth group of cymbals, drums, and another gong. The Burmese orchestras differ from the Indonesian and Thai groups by the unique use of a row of tuned drums (sometimes called a drum circle), with sounds consisting of sharp attacks and quick-vanishing waves. The fourth area, Indonesia, Malaysia, and the Philippines, uses several types of suspended and horizontally laid gongs. These gongs produce various combinations of sounds. In Nias, an island west of Sumatra, one group of three heavy suspended gongs plays three rhythms of homogeneous sounds. Suspended gongs with a wide rim and a high knob are played alone, with another gong or with a drum on the Philippine islands of Mindanao and Palawan and the Indonesian island of Kalimantan (Borneo). Gongs laid in a row, called *kulintang,* are melody instruments accompanied by a percussion group. The most developed melodies are found in Mindanao, and the area of distribution extends to Borneo, Sumatra, and Celebes, in Indonesia. The sets of tuned gongs found throughout Southeast Asia are also called gong chimes, gong kettles, and gongs in a row.

Homogeneous and heterogeneous sound

Tonal systems. In contrast to the Western diatonic-scale system (based on seven-note scales comprised of whole and half steps) and its association with relatively "fixed" pitches, there prevails a gapped system in Southeast Asia (*i.e.,* scales containing intervals larger than a whole step) with elastic intonation. Examples include the five-tone *slendro* and the seven-tone *pelog* of Java and the seven-tone scale of Thailand. In each of these systems the distances between corresponding tones in two different sets of octaves are not exactly the same. For example, one Javanese *slendro* octave has the following intervals expressed in cents (a unit of pitch measurement; 1,200 cents make 12 semitones or one octave): 246, 241, 219, 254, 246; another has 245, 237, 234, 245, 267. In contrast, two tunings of the Western chromatic scale theoretically always have 12 semitones of 100 cents apiece.

Modal systems

Related to tonal systems are modes, which in Southeast Asia use tones of a particular scale system to form melodies. Associated with a given mode are a hierarchy of pitches, the principal and auxiliary tones, endings of melodic phrases (cadential formulas), ornaments, and the vocal line. Modes express emotions and are applied to different times of the day and night and to particular situations in stage plays. They are clearly present, with local variations, in Java, Vietnam, and Burma but are less distinct in Bali, Thailand, Laos, and Cambodia.

In rural areas a multitude of scales with mixed diatonic and gapped systems and no modes are used.

Musical time and improvisation. Musical time is generally divisible in units of two or four in urban music, but it occurs more freely and without a metric pulse in rural areas, especially in singing. Musical improvisation or the use

of variations based on a melodic theme is not universal. It is essential to the playing of the *rebab* and singing in the Javanese gamelan, the tappings on the Burmese circle of drums, and the percussive playing on the *kulintang*. But, in fast playing in the Balinese gamelan, exact repetitions of patterns are necessary, for there is no time for the performer to think of alternative formulas. Similarly, the separate rhythmic patterns of five instrumental parts do not change in the gong (*gangsa*) music of the Ibaloi of Luzon. Repetition is the essence of the music.

HISTORICAL DEVELOPMENTS

Origins. *Early bamboo instruments.* The widespread use of bamboo musical instruments in practically all parts of Southeast Asia points to the antiquity of these instruments and, probably, that of the music they play. A historical citation of mouth organs and jew's harps in the Chinese *Shih Ching* ("Classic of Poetry") shows that these instruments were known in the 8th century BC. Previous to this time, other bamboo musical instruments were probably in use, just as bamboo tools were used in pre-Neolithic times.

Drones and ostinato

The music of pre-Neolithic types of bamboo musical instruments, such as are played in the 20th century, may be just as old as these instruments. One general feature that points to this antiquity is the widespread and frequent use of a very simple musical element: a sustained tone (drone) or repetition of one or several tones (ostinato). Sustained tones appear in the mouth organ, where one or two continuous sounds are held by one or two pipes while a melody is formed by the other pipes. Prolonged tones may also be heard in rows of flutes played by one person in Flores. One flute acts as ostinato and the rest make a melody. In group singing, an underlying held tone is common. Repetition of tones occurs in bamboo instruments (jew's harps, percussion tubes and half percussion tubes, zithers, clappers, slit drums) as well as in nonbamboo instruments. In the *kudjapi*, a two-stringed lute, one string is used for the ostinato and the other to pluck the melody. In the log drum, two players play fast rhythms of continuous sounds while another player taps improvised rhythms.

Bronze instruments in gong families of Indonesia, Thailand, and Burma employ repeated sounds acting as ostinati. A widespread and preponderant use of dronelike or repeated sounds in Southeast Asia shows that they are probably an ancient fundamental musical element.

Early bronze instruments. The earliest bronze musical instruments are kettle gongs (deep-rimmed gongs), which date back to about 300 BC and are found in Vietnam, Bali, Sumatra, Borneo, Thailand, and Burma. In Burmese gongs the use of a heavy beater for the centre and a lighter stick to strike the side denotes an opposition of a full and a tiny sound applied today also to the *babandil* and other gong ensembles in Palawan and Borneo.

Gongs that predominate in Southeast Asia are those with a boss, or central beating knob. The many varieties differ according to their shapes, chemical properties, playing position, number in a series, manner of playing, musical function, and sound. Flat gongs without a central boss are not as widely used. They are found in the hills of Thailand, Laos, Cambodia, Vietnam, in some parts of Indonesia, and in the northern Philippines and may have come to Southeast Asia either through China in the 6th century or from the Middle East.

Musical traditions. The influence of the great traditions of Asia—Indian, Chinese, Islāmic, and Khmer (Cambodian)—on native Southeast Asian music varies in different countries. From India come principally two ancient Sanskrit epics—the *Mahābhārata* and the *Rāmāyaṇa*. Deep attachment to themes from the *Rāmāyaṇa* pervades the whole Southeast Asian region, except the Philippines, where Indian influence was weakest. Musical instruments attributed to India and appearing in 9th-century reliefs at the Buddhist temple of Borobuḍur and Hindu temple of Prambanan, in Java, are bronze bells, bar zithers, cymbals, conical drums, flutes, shawms, and lutes. They may still be found in several islands of Indonesia. Khmer gong circles, stringed instruments, mouth organs, drums, and oboes still in use in rural Cambodia and Vietnam are depicted in the 12th-century ruins at Angkor Wat in Cambodia. Prehistoric lithophones, or stone chimes, excavated in Vietnam in 1949, may have been the ancestors of kettle gongs. Chinese-type musical instruments (two- and three-stringed fiddles, bells, and drums), the use of the Chinese pentatonic (five-tone) scale, and duple and quadruple time (typical Chinese metres) are used in Vietnam, Burma, Thailand, Laos, and Cambodia. Islāmic musical instruments—drums, two-stringed fiddles (*rebab*), and three-stringed lutes—may be heard in Java, while melismatic singing (many notes to one syllable), especially in Islāmic rituals, is usual among the Malay groups on Borneo.

Mingling of influences

There are also musical instruments and elements that have developed locally. The mouth organs of Borneo, Laos, and Cambodia are probable ancestors of the Chinese *sheng* and the Japanese *sho* (mouth organs). Jew's harps, tube zithers, ring flutes, buzzers, xylophones, two-stringed lutes, and various types of gongs with boss (knobbed centre) are some of the most typical instruments of Southeast Asia. A probably ancient manner of measuring flute stops in Mindanao—dividing flute segments into proportional lengths to produce the octave, fifth, and other intervals—recalls a very old Chinese account of cutting bamboo tubes into lengths that would sound these same intervals.

In general, music in Southeast Asia is a tradition taught to each succeeding generation without the use of written notation. From exclusive families of musicians in courts, gamelan music was transmitted to the people. Epic and ritual songs are learned by rote and handed down from older to younger generations. Hence, skill in instrumental music is developed by imitation and practice.

Burma. Just as today all types of Burmese plays are accompanied by the traditional Burmese orchestra, the beginnings of Burmese theatre contained a music that, like the theatre, was probably based on primitive religious rituals. Before Indian and Chinese musical influences, the inspirational source of Burmese music and dance was the miracle plays (*nibhatkhin*), which, in turn, were based on singing, dancing, and entertainment in local folk feasts that date back to antiquity. The worship of spirits (*nats*) at Chinese festivals was accompanied by women who, through song and dance, communicated with and were possessed by these spirits. Following this practice, professional entertainers taking the place of women danced, sang, and played instruments during the first *nibhatkhin*. These practices led to the dancing and singing associated with the *pwe*, a popular play for public and courtly entertainment.

Foreign musical influences came from India, China, and Thailand. Indian elements appear in musical terms, theories about scales, and in some musical instruments—oboe, double-headed drums, cymbals, and the arched harp. Chinese influence appears to be older and is apparent in the use of the pentatonic scale and such musical instruments as table zithers (related to the Chinese *ch'in*), a dragon-head lute resembling a Chinese *p'i-p'a*, and two- and three-stringed fiddles. From Thailand and the Khmer civilization of Cambodia probably came both the use of gongs in a circular frame and the dramatization of episodes from the *Rāmāyaṇa*. In the traditional orchestra for state ceremonies, for the theatre, and, formerly, for royalty, three simultaneous variations of the same theme are performed by two sets of melodic percussion—a circle of about 21 tuned drums (*saing-waing*) and a circle of about 21 tuned gongs (*kyi waing*)—and at least one oboe (*hne*) or a flute (*pulwe*). To this is added a playing of a percussion group comprising a double-headed drum (*patma*), a pair of cymbals (*la gwin*), and clappers playing a duple or a quadruple metre. In three rhythmic patterns applied by these percussion groups to specific song types, the strong beats are always marked by the clappers.

Melodic traits

Melodies played on traditional instruments (*saing-waing*, harp, *pattala* or xylophone) are frequently broken by rests and consist of segments of two, three, or four notes that form phrases, usually of eight or 16 beats. Several phrases make up a number of verses to complete a musical rendition. Melodies, based on modes, are constructed according to the previously discussed elements usually found in

the modal music of Southeast Asia. Song types exist in Burmese music and are assigned to specific modes.

The Burmese arched harp (*saung gauk*) has features that may be traced back to pre-Hittite times and the Egyptian 4th dynasty (*c.* 2613–*c.* 2494 BC). Scarcely existent outside of Burma, this instrument has undergone a renascence in the 20th century. A more popular solo instrument is a wooden xylophone *pattala.*

The following instruments may be found among ethnic groups in rural Burma: idiophones, or resonant solids—bamboo jew's harps, clappers, cymbals, wooden slit drums, bronze kettle gongs, drums; membranophones, or vibrating-membrane instruments—goblet drums; chordophones, or stringed instruments—crocodile zithers, monochords with calabash resonators, three- and four-stringed fiddles; aerophones, or wind instruments—lip-valley flutes, ring flutes, panpipes, double-reed winds, buffalo horns, and mouth organs.

Thailand, Laos, and Cambodia. Although their individual political histories differ, the music practiced in Thailand, Laos, and Cambodia is almost identical. The musical instruments and forms of this region spring from the same sources: India, the indigenous Mon-Khmer civilizations, China, and Indonesia. In Thailand, three types of orchestras, called *pi phat, kruang sai,* and *mahori,* exist. The *pi phat,* which plays for court ceremonies and theatrical presentations, uses melodic percussion (gongs in a circle, xylophones, metallophones) and a blown reed. The *kruang sai* performs in popular village affairs and combines strings (monochords, lutes, and fiddles with two and three strings) and wind instruments (oboes and flutes); while the *mahori,* as accompaniment of solo and choral singing, mixes strings (floor zithers, three-stringed fiddles, and lutes) and melodic percussion (gongs and xylophones) with the winds (flutes and oboes). All three ensembles are provided with a rhythmic group of drums, cymbals, and a gong to punctuate the melody parts. Some of the above musical instruments and their functions may best be illustrated in the *pi phat* ensemble below.

Thai ensembles

A slow-moving theme is played by gongs arranged in a circle (*khong wong yai*) with variations in smaller gongs (*khong wong lek*), two wooden xylophones (*ranat ek, ranat thum*), and two box-shaped metallophones (*ranat thong ek, ranat thong thum*). The last three pairs of instruments vary the theme by playing twice as fast or by repeating, anticipating, and revolving around it. A double-reed oboe (*pi nai*) hovers above the melodic percussion, providing the only blown sound in the ensemble. Together with the punctuating gongs and drums, the whole orchestra displays a polyphonic (many-voiced) stratification of instrumental parts, using unisons and octaves mainly in the strong beats.

A melody may be broken down into phrase units consisting of two or four measures that may be joined by four other phrase units to make a phrase block, and a given number of blocks constitutes one musical composition. Three speeds of rendition—slow, medium, fast—in either duple or quadruple time are marked by two alternating strokes in a pair of cymbals; a dampened clap marks a strong beat, and a ringing vibration denotes a weak beat.

The tuning system is made up of seven tempered (approximately equidistant) tones to an octave. But the melodies constructed out of this system use only five tones out of seven—which sound close to a Chinese pentatonic scale. This scale may be constructed in any of seven levels or tones of the Thai tuning system. Further, through a process called *metabole,* melodies may move from one level to another.

Shadow-play music and dance

In the Cambodian shadow play (*nang sbek*) two narrators alternate in chanted recitative to explain the role of the leather puppets. Dancers parading these figures across the screen and simulating their actions are accompanied by an orchestra. A limited number of tunes is played to eight dance positions (walk, flight or military march, combat, meditation, sorrow or pain, promenade, reunion, and metamorphosis). In the play these poses are assumed by princes, princesses, monkeys, demons, peasants, or ascetics.

Among different ethnic groups, such as the Khmer Saoch, Pwo Karen, Bu Nuer, Kae Lisu, Kuoy, and Samre, a rural music related to that of the ancient Khmer peoples is played by aerophones (buffalo horns, mouth organs, vertical flutes), idiophones (flat gongs, gongs with boss, cymbals, jew's harps), chordophones (bamboo zithers), and membranophones (circle of drums). Other important instruments for solo performance or as accompaniment to songs are the three-stringed crocodile zither (*chakhe*), a four-stringed lute (*grajappi*), a plucked monochord with a gourd resonator (*phin nam tao*), and a bamboo whistle flute (*khlui*).

Vietnam. Although Vietnamese music belongs to the great Chinese musical tradition, which includes the music of Korea, Mongolia, and Japan, some of its musical elements are indigenous or come from other parts of Southeast Asia, and some derive from Champa, an ancient Hinduized kingdom of Vietnam. Archaeological finds in the village of Dong Son revealed that the ancient Vietnamese used kettle gongs, mouth organs, wooden clappers, and the conch trumpet. From the 10th to the 15th century a joint Indian and Chinese element left its musical imprint. The Chinese seven-stringed zither (*ch'in*) and a double-headed drum were played together, or a Champa melody was accompanied by a drum. It was at this time that two traditional Chinese ensembles—Great Music and Little Music—and an elementary Chinese theatrical art were introduced. From the 15th to the 18th century the Chinese influence reached its height. Court music (*nha nhac*) was played by two orchestras. One, located in the Upper Hall of the court, consisted of a chime of 12 stones, a series of 12 bells, a zither of 25 strings (Chinese *se*), a zither with seven strings (Chinese *ch'in*), flutes, panpipes, a scraper in the shape of a tiger, a double-headed drum, a mouth organ, and a globular whistle. The second orchestra in the Lower Hall used 16 iron chimes, a harp with 20 strings, a lute with four strings (Chinese *p'i-p'a*), a double flute, a double-headed drum, and a mouth organ. Ceremonial music, almost nonexistent in the 20th century, was patterned after court music.

Traditional court music

In Buddhist ceremonies, prayers were recited in three ways: as recitation in a low voice, as a cantillation (sung, inflected recitation) following the six tones of the Vietnamese language, and as chant accompanied by an orchestra of two drums, bell, gong, cymbals, and fiddles.

Music as entertainment is mostly a vocal art played without ritual outside the court and still enjoyed by many people. The *hat a dao* found in the north is the oldest form. It is a woman's art song with different instrumental accompaniments, dances, a varied repertoire, and a long history of evolution.

From the 19th century to World War II, Vietnamese music reaffirmed its character. Although the playing of court music was restricted, popular music was encouraged, leading to northern and southern styles that were patronized by both the aristocracy and commoners. Western musical influence in this period was manifest in the use of the mandolin, the Spanish guitar, and the violin, as well as by the introduction of European classical music and composition following Occidental forms. In the late 20th century traditional Vietnamese music began to disappear, but attempts to revive it began in the early 1970s.

Vietnamese rural folk music is built on the same musical principles as court music. The main difference lies in its application to village activities—work, games, courting, marriage, cure for the sick, entertainment, feasts.

Elements of Vietnamese music

Common elements characterize and unify all Vietnamese music. It is based on an oral tradition, with written notation serving only as a reading guide. Melodies are generally built out of a pentatonic system (for example, C, D, F, G, A) to which two auxiliary tones (E, B) may be added to make other pentatonic melodies. A song, usually preceded by a prelude, may be sung in slow, moderate, or fast tempo divisible by two or four, with a simple contrapuntal (countermelody) accompaniment using unisons and octaves at beginning points of phrases. Outside of the first beats, intervals of fifths, fourths, thirds, and even seconds are allowed. An important aspect of melodies is the idea of mode (*dieu*), the elements of which do not essentially differ from those of Javanese and Burmese music.

Indonesia and Malaysia. *Java.* A Javanese philosophical concept based on mysticism, refinement (*halus*), and the inner life as related to Hindu, Islāmic, and Indonesian thought may best be represented in music by the Javanese gamelan, an orchestra made up mostly of bronze instruments producing homogeneous blended sounds. The instruments in the ensemble may be divided into three groups of musical function. The first group comprises thick bronze slabs (*saron demung, saron barung, saron panerus*) on trough resonators playing the theme usually in regular note values without ornamentation. The second group consists of elaborating or panerusan instruments, which add ornaments to the main theme. In this group gongs in double rows (*bonang panembang, bonang barung, bonang panerus*) play variations with the same ratio of speed as the *saron* group. In softer sounding music for indoor performance, other panerusan instruments with very mellow sounds come in. These are three sizes of thin bronze slabs with bamboo resonators—*gender panembung* or *slentem, gender barung,* and *gender panerus.* Other elaborating instruments are the wooden xylophone (*gambang*), the zither (*tjelempung*) with 26 strings tuned in pairs, an end-blown flute (*suling*), and a two-stringed lute (called a *rebab* by the Javanese), which leads the orchestra. In loud-sounding music, the soft-sounding instruments are not played, and the drum (*kendang*) leads the orchestra. The third group provides "colotomic," or punctuating beats in four rhythmic patterns played separately by four types of heavy, suspended, or horizontally laid gongs.

Instrument groups of the gamelan

Two tuning systems prevail. The *slendro* tends to have five equidistant but flexible (or varying) pitches in an octave, while the *pelog,* with seven equally flexible tones, has a more varied structure. One tuning with intervals expressed in cents (140, 143, 275, 127, 116, 204, 222) may roughly be represented by the following notes in a descending scale: C↑, A♯, G♯, G↓, F↑, D♯↓, C♯↑, and C. (Arrows up are tones slightly higher than Western tempered tuning [in which a semitone is equivalent to 100 cents] and vice versa for arrows down.) Melodies from these tunings are governed by a modal structure (*patet*) the elements of which are similar to those of Vietnamese and Burmese music.

Scales and modes

In West Java the most popular ensembles use a vocal part, a two-stringed fiddle (*rebab*) or a bamboo flute (*suling*), and a zither (*kachapi*). In the gamelan, submodes (*surupan*) are formed by the use of vocal tones—sung or played on the *suling* or *rebab*—which amplify the number of scales in both the *pelog* and *slendro* systems.

Bali. In contrast to the introspection of Javanese music, the Balinese gamelan exudes a music of brilliant sounds with syncopations (displaced accents) and sudden changes, as well as gradual increase and decrease in volume and speed and feats of fast, precise playing. The tuning system, musical instruments, and polyphonic stratification are similar to those of the Javanese gamelan, although in Bali the seven-tone *pelog* is not popular. Most gamelan are tuned to a five- or four-tone system, and the concept of modes is not as clearly developed as in Java. A variety of gamelan exists, each with a special function, instrumentation, repertoire, and tuning system. The *gamelan gong* orchestra is among the most extensive in its number of instruments. A modern version, *gong kebjar,* omits the *trompong* (gongs in a row) and *saron* (bronze slabs over a trough resonator) and replaces them with *gangsa gantung* (metallophone with bamboo resonators) and *rejong* of four gongs to produce exuberant outbursts of sound. The *gamelan gambuh,* now rare, comprises four end-blown flutes, one *rebab,* and a group of percussion. The *gamelan semar pegulingan,* played formerly in royal courts but now almost disappeared, emphasizes the *trompong* as a solo instrument. The *gamelan pelegongan* is a virtuoso orchestra that accompanies *legong* dances, while the *gamelan pedjogedan* is an orchestra of xylophones for dance (*djoged*) and entertainment in the marketplace. The *gender wayang* is a quartet of *slendro* tuned metallophones specially employed for shadow plays. The *gamelan angklung,* a village orchestra assembled during ceremonies, anniversaries, and cremations, originally consisted of rattling tubes that are now replaced by metallophones. The *gamelan ardja* is characterized by a soft timbre (tone colour) and the use of a one-stringed bamboo zither, the *guntang,* to accompany musical comedy and popular plays.

Varieties of Balinese gamelan

Other parts of Indonesia. In the islands of Flores, Nias, New Guinea, Celebes, and Borneo idiophones make up perhaps the most varied collection of musical instruments—gongs of various profiles, slit drums, jew's harps pulled with a string, clappers, bells, xylophones, percussion sticks, bull-roarers, and stamping tubes. Particularly interesting are idiophones made of bones, shells, skulls, fruits, seeds, planks, pellets, crab claws, clogs, coconut, and shark bones. Membranophones are represented by drums shaped like a cylinder, goblet, vase, round frame, hourglass, cone, cup, barrel, or a tube. Aerophones present an array of vertical and transverse (horizontally played) flutes, panpipes, ring flutes, shawms, clarinets, gourd trumpets, conch shells, ocarinas, and flutes with different mouthpieces. Chordophones include bamboo zithers, spike fiddles (in which the neck skewers the body), one- and two-stringed lutes, musical bows, monochords, guitars, *rebabs,* bar zithers, and sago zithers. In Flores, part singing with a sustained drone is frequent. Songs in Nias use diatonic (whole and half steps), chromatic (half steps), and gapped melodies largely less than an octave in range. In Sarawak descending melodies make up a tetrachord (four adjacent tones forming the interval of a fourth). In Indonesian New Guinea departures from songs with gapped scales include fanfare, stair descent, and tiled melodies (the last consisting of short phrases repeated at different pitch levels).

Malaysia. At least three principal cultural influences—Indonesian, Hindu, and Islāmic—left their musical marks in Malaysia. The Indonesian influence is seen principally in musical forms, participants, and paraphernalia of the Malaysian shadow play (*wayang kulit*). It is said that the Indian epics and, especially, the *Pandji* tales of Java came to Malaysia via Indonesia, but there are songs in certain plays and musical instruments (*e.g.,* the double-headed drum and oboe) that could have reached Malaysia from India through other routes. Islāmic traces are evident in melismatic songs among the Malay groups in songs connected with religious rituals and in choral singing in the *ma'yong* plays. Chinese music, a more recent development, is largely practiced among the Chinese communities, principally in Singapore.

Before Malaysian independence, the *nobat,* an old royal instrumental ensemble dating back to about the 16th century, played exclusively for important court ceremonies in the palaces of the sultans of Perak, Kedah, Selangor, and Trengganu. Today, in Kedah, the ensemble consists of five instruments: one big goblet drum (*negara*), two double-headed drums (*gendang*), one long oboe (*nafiri*), one small oboe (*nafiri*), and one gong. The music, which consists of ten surviving pieces, is broadcast today and performed live.

Three shadow plays exist, principally in the state of Kelantan. The *wayang gedek* is the Thai form; *wayang Djawa,* a Malay form, is almost extinct; and the *wayang Siam,* which is a combination of Thai and Malay influences, is the most popular form of puppet shadow play. The operator of the performance is the narrator (*dalang*), who manipulates the leather figures, introduces important characters, and describes different scenes with the accompaniment of the orchestra. The music is led by a two-stringed lute (*rehab*) in the *Rāmāyaṇa,* or an oboe (*serunai*) in *Mahābhārata* and *Pandji* cycles. The melodic instruments are supported by a percussion group consisting of pairs of goblet-shaped drums (*gedombak*), cylindrical drums (*gendang*), barrel drums (*geduk*), gongs lying on a support (*chanang*), suspended gongs (*gong*) or, sometimes, a row of gongs played by two or three men, and one pair of cymbals (*kesi*). The music usually begins with a prelude followed by a list of pieces the sequences of which are dictated by the narrator.

The *ma'yong,* a dance drama that probably dates back to more than 1,000 years, was introduced in Kelantan under the patronage of the royal courts. In the 20th century it exists as a folk theatre with an all-female cast. The music that accompanies 12 surviving stories is played by an orchestra of one bowed lute (*rebab*), two suspended

gongs, and a pair of double-headed drums (*gendang*). A heterophony (simultaneous variation of the same melody) between a solo voice, a chorus, and the *rebab* creates a music with a Middle Eastern flavour.

Variety in instruments

A rich musical heritage in the rural sections of Malaya is shown in musical instruments used by Malay, Thai, Semang, and Sakai groups. Idiophones include shell and coconut rattles, the jew's harp (mostly pulled by a string, rather than plucked), bull-roarers, bamboo clappers, and the bamboo slit drum. Aerophones include the buffalo horn, wooden and clay whistles, nose flutes, end-blown flutes, and the oboe. Chordophones are two- and three-stringed fiddles with coconut resonators, monochords, and tube zithers. One membranophone is a double-headed cylindrical drum.

In Borneo among the Malay, Kadazan, and Iban groups, the principal instruments are gongs in a row (*gulintangan*) played with suspended gongs of different types (*chanang, gong, tawak-tawak*). Among the Murut, Kenyah, and Iban the mouth organ with a calabash resonator (*sompoton*) plays a melody with a drone accompaniment. The jew's harp (*ruding*), bamboo zither (*tongkungon*), nose flute (*tuali*), hourglass drum (*ketubong*), and vertical flute (*suling*) may be heard among different ethnic groups. Iban ceremonial songs are sung in connection with rice festivals and rituals to prevent sickness, while mourning songs make up a rich repertoire of solo and leader–chorus singing. The Kenyah are particularly adept at blending low voices of men singing a melody supported by a drone.

The Philippines. Two musical cultures—Western and Southeast Asian—prevail in the Philippines. Western music is practiced by about 90 percent of the population, while Southeast Asian examples are heard only in mountain and inland regions, among about 10 percent of the people.

The Western tradition dates back to the 17th century, when the first Spanish friars taught plainchant and musical theory and introduced such European musical instruments as the flute, oboe, guitar, and harp. There subsequently arose a new music related to Christian practices but not connected with the liturgy. Processional songs, hymns in honour of the Blessed Virgin, Easter songs, and songs for May (Mary's month) are still sung in different sections of the country. A secular music tradition also developed. Guitars, string ensembles (*rondalla*), flute, drum, harps, and brass bands flourished in the provinces among the principal linguistic groups and still appear during town fiestas and important gatherings. Competing bands played overtures of Italian operas, marches, and light music. Young men, like their counterparts throughout the Hispanic world, sang love songs (*kundiman*) in nightly serenades beneath the windows of their ladies. It was not uncommon in family gatherings for someone to be asked to sing an aria, play the harp, or declaim a poem. Orchestral music accompanied operas and operettas (*zarzuelas*), while solo recitals and concerts were organized in clubs or music associations. With the advent of formal music instruction in schools, performance and composition rose to professional levels. In the 20th century several symphony orchestras, choral groups, ballet companies, and instrumental ensembles performed with varying regularity.

Gong ensembles

A Southeast Asian musical tradition exists completely apart from the Western tradition. In the north, flat gongs are played in different instrumental combinations (six gongs; two gongs, two drums and a pair of sticks; three gongs). In the ensemble with six gongs, four are treated as "melody" instruments, one as ostinato, and another as a freer layer of improvisation. The melody consists of scattered tones produced by strokes, slaps, and slides of the hands against the flat side of the gong. Other musical instruments in the northern Philippines are bamboo. These are the nose flute (*kalleleng*), lip-valley or notched flute (*paldong*), whistle flute (*olimong*), panpipes (*diwdiwas*), buzzer (*balingbing*), half-tube percussion (*palangug*), stamping tube (*tongatong*), tube zither (*kolitong*), and jew's harp (*giwong*). Leader–chorus singing among the Ibaloi is smooth and sung freely without a metric beat, while the same form among the Bontoc is emphatic, loud, and metric. Scales in songs and musical instruments use from two to several tones within and beyond an octave and are arranged as gapped, diatonic, and pentatonic varieties.

In the southern Philippines (the islands of Mindanao and Sulu), the more developed ensemble is the *kulintang*, which consists of eight gongs in a row as melody instruments accompanied by three other gong types (a wide-rimmed pair; two narrow-rimmed pairs; one with turned-in rim) and a cylindrical drum. The *kulintang* scale is made up of flexible tones with combinations of wide and narrow gaps sometimes approaching a Chinese pentatonic variety and oftentimes not. Its melody is built on nuclear tones consisting of two, three, or more tones to form a phrase. Several phrases may be built, repeated, and elongated to complete one rendition lasting two to three minutes. Pieces of music are played continuously for a long period during the night.

In the central west Philippines on the island of Mindoro, love songs are sung that are based on reciting tones with interludes played by a miniature copy of the Western guitar or a small violin with three strings played like a cello.

(Jé.Ma.)

The performing arts

In variety of dance and theatrical forms and in the number of performing groups, no area in the world except India and Pakistan compares to Southeast Asia. Some form of the performing arts is a normal part of life throughout the several nations. Sophisticated performing groups cluster in and around the present and former court cities—Jogjakarta and Surakarta in Java, Ubud and Gianjar in Bali, Bangkok in Thailand, Mandalay in Burma, Siem Reap near Angkor and Phnom Penh in Kampuchea (Cambodia), Hue in Vietnam—where drama, puppetry, dance, and music have been cultivated for ten centuries or more. Hundreds of commercial theatrical and dance groups perform in such newer centres as Rangoon, Saigon, and Jakarta and in scores of provincial cities and towns. Wandering troupes of actors, puppeteers, singers, and dancers travel from village to village in areas adjacent to these population centres. There are few communities in which some form of folk dance is not performed by local people.

Richness of form and experience

In the West, music, dance, and drama are usually separate arts, whereas in all areas of Southeast Asia, drama, dance, mime, music, song, and narrative are integrated into composite forms, often with masks or in the form of puppetry. The spectator's senses, emotions, and intellect are bombarded simultaneously with colour, movement, and sound. The result is a richness and a vividness in the theatre that is absent in most Western drama, so much of which rests on a literary basis.

More than 100 distinct forms or genres of performing arts can be distinguished in Southeast Asia. These can be grouped, according to which of the various stage arts is emphasized, into (1) masked dance and masked dance-mime, (2) unmasked dance and dance-drama, (3) drama with music and dance, (4) opera, (5) shadow-puppet plays, and (6) doll- or stick-puppet plays.

DIVERSE TRADITIONS IN THE PERFORMING ARTS

Four relatively distinct traditions exist in the performing arts: folk, court, popular, and Western.

The folk tradition. Dances in the folk tradition are exceptionally numerous and widespread. Some are performed as religious ritual, others, particularly on the Indonesian island of Bali, by highly trained and respected artists, and still another kind as entertainment in which the community participates. Folk theatre is more complex than folk dance and thus less widespread, but it has deep connections with religious ritual. Although the origins of most folk performing arts lie in remote times, later court forms exerted important influence on many of the folk forms. Conversely, folk forms have been a source of inspiration to court artists.

The court tradition. The shadow play and masked and unmasked dance are court arts reflecting centuries of subtle refinement under the patronage of kings and princes. In Southeast Asia the shadow theatre is a major classic art. Leather puppets of mythological figures, the bodies intri-

Shadow plays

cately incised to allow light to pass through, are attached to sticks for manipulation. A lacy shadow is created by a flaming lamp as the puppet is pressed against the back of a vertical screen of white cloth. The flickering and insubstantial shadow seen from the other side creates for the understanding viewer a mystic world with deep symbolic meaning. In Java, Bali, Malaysia, Cambodia, and Thailand shadow plays and their techniques have been emulated by human actors and dancers and have been the models for marionette and doll-puppet theatre.

Dance troupes have been a part of court life at least since recorded history began. In the mainland courts of Cambodia, Thailand, Laos, and Burma, concubines of the ruler's harem who performed female dances were segregated from male performers, giving rise to separate forms of female unmasked dance and male masked dance-mime. Although certain dances traditionally are performed only by men or only by women in Indonesia and Vietnam, mixed casts have a long history, especially in dramatic pieces. Court dance on the mainland and in Indonesia has been influenced by Indian dance style, and Vietnamese dance by the dance styles of Chinese opera, but they have acquired a distinctly Southeast Asian character. Court dance reached its greatest development when applied to mythological and legendary themes, often taken from the shadow theatre. The resulting dance-dramas and masked dance-mimes of Thailand, Cambodia, and Java are world famous for their magnificent scale and elegance of execution. Some of these court arts are no longer performed, and others face increasing difficulty securing financial support, yet they remain important.

The popular and Western traditions. In the popular traditions are those 400 to 500 professional troupes who perform, except in the Philippines, in commercial theatre buildings of major cities for an urban ticket-buying audience. Some forms of popular theatre are directly modelled on court dance-drama, but most are spoken drama in which court-derived music, song, and dance movements have been inserted. Local legend and history provide the subject matter for many of these plays. As in much of Asia, the performer in the popular tradition is seldom accorded status and may be despised as a vagabond.

The spoken drama, the ballet, and the modern dances are known only superficially in Southeast Asia. The sole exception is the Philippines, where amateur performances of Western plays constitute the country's main theatrical tradition. Southeast Asian audiences generally find Western plays based mainly on dialogue to be uninteresting and deficient in artistic qualities. European and American films and television programs, however, are widely shown and appreciated, and popular Western dances are found in major urban areas. Undoubtedly the impact of these forms on local audiences will continue to increase, possibly to the detriment of the indigenous traditions.

CHARACTERISTICS OF DANCE

Dramatic and nondramatic forms. In the parts of Southeast Asia influenced by Indian forms—everywhere except for Vietnam and the Philippines—nondramatic and dramatic dance are both known. Nondramatic, or "pure," dances that do not express emotional states of characters are numerous in both folk and court traditions. Among court dances, the Javanese *bedaja* is typical. Nine dancers move in unison, without emotional expression, in precisely fixed choreographic patterns designed to demonstrate sheer grace of movement. The *maebot,* composed as a Thai "alphabet of dance," is used to train pupils in the basic movements of court dance. Other dances that include character impersonation yet are not explicitly storytelling dances lie between nondramatic and dramatic dance. In the Thai *praleng,* two performers wearing god masks and holding peacock feathers in both hands perform an offertory dance to the god before the main dance-play begins. The Balinese *legong,* danced by a pair of preadolescent girls, may have only the most tenuous dramatic content. Its interest lies in the girls' unison rapid foot movements and fluttering movements of eyes and hands. Dramatic dance is seen at its best in full dance-dramas and in the excerpts from them that are sometimes danced in concert form.

Use of eyes and hands

Styles and conventions of movement and costuming. General characteristics of both dramatic and nondramatic dance are (1) slowness of tempo except in battle scenes, (2) controlled and reserved movements rather than expansive ones, (3) little of the leaping typical of Western ballet but, instead, a feeling of closeness to the ground, and (4) extensive use of arm and hand gestures. From Indian dance has come an open and flexed position of the legs, a side-to-side sliding movement of the head and neck, and a rigidly codified vocabulary of hand and finger gestures known as *mudrās* or *hastās* in India. In most cases the Indian elements have been altered greatly over their 1,000-year period of assimilation. In Thai, Cambodian, and Lao dance, the 24 to 32 Indian *mudrās* have been reduced to nine; in Javanese dance seven can be recognized, and in Bali only one or two. They have also been altered in their shape, and the many specific meanings attached to each in India have become fewer, while in some cases a gesture has no specific meaning. Such hand gestures as shading the eyes and tying the sash, which appear in Javanese dances, are unknown in India. Foot movements in India typically follow the rhythm of a drum, often with vigorous stamping sounds that are emphasized by bells on the ankles, but such movements are virtually absent in Southeast Asia. The exaggerated eye, eyebrow, cheek, mouth, and chin movements through which the Indian dancer expresses a broad gamut of emotions are nowhere to be seen. Balinese dancers use darting eye movements, but the court dancer's face is composed into an almost unchanging expression of aloof gentility.

Close contact between neighbouring countries has led to the development of two regional Indian-influenced dance styles, one for Thailand, Cambodia, Laos, and Burma and one for Indonesia and Malaysia. Characteristics of the former style include the soft *pi phat* music of bamboo xylophones, drums, gongs, and oboe as accompaniment, bent-back finger positions not seen elsewhere in Asia, similar and often identical movements for male and female roles, courtship dances in which lovers touch each other and move in unison, and, in dance-drama, lengthy pure-dance pieces inserted solely for their beauty. In the latter style, the performance is accompanied by music of the gongs and metal bars of the gamelan orchestra. Scarves draped from the waist or neck are flicked for effect and manipulated to indicate strength or flying, and male and female dance are clearly distinguished by the powerful masculine lunges of the men and the tiny steps of the women, who also dexterously manipulate the train of the skirt with their feet. Visually, the mainland dance sparkles. Costumes of brilliant silk are covered with sequins and even jewels, and golden crowns and sparkling body ornaments glitter with reflected light. The male dancer in Indonesia wears a soft batik skirt of brown and white, the female a black velvet bodice. Arms and shoulders are bare and powdered golden brown, creating a subdued and warm effect.

Courtship dances

The main style in Vietnam, apart from folk dance, is dramatic and highly pantomimic, like the movements of Chinese opera. In classical opera, the flowing white sleeves and the pheasant feathers bobbing from the general's headdress are twirled and flicked by the actor in many conventionalized movements derived from Chinese forms. Battle scenes are choreographed into precise dance patterns, but the acrobatic movements common in Chinese opera are seldom seen.

CHARACTERISTICS OF DRAMA

Thematic origins and materials. Most traditional plays and dramatic dances are derived from mythological and legendary sources. The tribal epics that relate the origin of the Ifugao and the Bicolano peoples in the Philippines and a number of animistic stories in Indonesian shadow theatre are indigenous myths of great age, while the widely used, romantic *Pandji* cycle from Java and the Thai *King Abhai Mani* and *Khun Chang Khun Phan* are more recent local legends. The most important dramatic sources, however, are borrowed from the Indian *Rāmāyaṇa* and *Mahābhārata* epics, from the *Jātaka* Buddhist

birth stories, from Chinese novels (such as *The Romance of the Three Kingdoms*) and Chinese operas, and from a host of Islāmic stories, including the *Thousand and One Nights* and the Amīr Ḥamzah tales. These foreign stories are turned into local legends. For example, the Indian Prince Rāma becomes a Thai, a Balinese, or a Javanese prince, embodying the heroic traits admired in each of these countries.

Theme of the restoration of earthly harmony

Plays are invariably extensive and have many scenes. It is not unusual for a play to present action over several generations, an indication of the value placed on cultural continuity. A recurring theme concerns restoration of harmony on earth by a ruler acting in accord with divine law. A kingdom is restored, a prince unjustly exiled returns to assume his throne, a usurper is punished, or the prosperity of the land is assured by consummating a particularly desirable marriage. As in Western drama, the hero gains his ends through struggle. Because he acts as the human representative on earth of the known cosmic will, however, his actions exhibit a natural sweetness and serenity, even in the midst of violence, that is foreign to Western drama. Meditation is often the means whereby the hero gains the power to achieve his goal. In more recent plays based on local history and on contemporary events, the assumption of cosmic harmony has been muted, and emphasis has shifted to depicting human conflicts—nationalist versus Western colonialist, modern daughter versus conservative parents, for example—that may or may not resolve happily.

Characters. Gods, demigods, kings descended from the gods, and princes and princesses are the heroes and heroines of traditional drama and dance. Powerful religious seers advise them, allies and ministers serve them, crude foreign ogres oppose them, and grotesque, slapstick clown-servants are their attendants. The clowns have been the subject of much speculation. Like the *vidūṣaka* clown of Indian Sanskrit drama, they are gluttons, practical and even cynical, and confidants to their masters' passions and weaknesses. Scholars have theorized that the chief Javanese clown figure, Semar, is derived from an ancient Javanese god who was deposed from his supreme position by the introduction into the drama of the later Hindu gods. In the midst of mythological plays, the clowns comment irreverently on political or social issues of the day, seemingly as spokesmen for the common man in an otherwise aristocratic world. Comic and serious scenes alternate.

Improvisation by variation

Dramatic materials. A written script may be used as the starting point for performance, but usually actors, dancers, musicians, and stage crew improvise from a brief scenario. Specific musical selections are matched to certain kinds of scenes, characters, or actions, and standard movements for entrances and exits are known. Standard descriptive phrases of the kind common in all oral literature are used to introduce the hero and his kingdom, and more than a dozen types of recurring scenes are identifiable. A major interest in playgoing lies in perceiving the skill with which performers rearrange and subtly vary these familiar elements from play to play. Narrative commentary accompanying the dances often interprets a specific action in its broad context, thus helping to universalize the theatrical experience.

Costumes, makeup, and settings. Costume and makeup have great importance in plays and dances. By means of elaborate systems of changing the cut, colour, and ornamentation of costume, the shape of the hairdress, the configuration of the crown, or the facial delineation and colour of masks, at least 300 different dance and dramatic characters can be identified. Doll- and shadow-puppet figures are carved according to similarly elaborate means of identification. Persons familiar with a dance or theatrical form can identify most characters by name or by type. Costumes, masks, and puppets may be works of art highly prized in themselves. Court and folk performances once used no scenery at all. Canvas scenery depicting stock scenes is now used by most popular troupes, but unfortunately it is often as inartistic as it is inexpensive. Only the Thai National Theatre, major troupes performing the popular *cai luong* drama in Vietnam, and troupes performing in the Western tradition throughout Southeast Asia attempt to design three-dimensional scenery for each play.

ORIGINS AND DEVELOPMENT OF THE PERFORMING ARTS

Prehistory and links to the present. Knowledge of prehistoric performing arts is necessarily slight. That the performing arts were known and apparently widely practiced by the prehistoric peoples who had settled the mainland and the island archipelagoes is suggested by large bronze drums cast before the time of Christ, numerous pre-Hindu tribal myths in remote areas of the Philippines and elsewhere, masked dances of many types still performed by isolated tribes in Kalimantan (Borneo) and in New Guinea, and descriptions of music and dance by Chinese visitors beginning as early as the 1st century AD. Simple dances were almost certainly accompanied by rhythmic percussion sounds and probably by the tuned metal bars or gongs thought to be indigenous to Southeast Asia. Some scholars suggest that tribal ancestors, animistic spirits, and animals were represented, perhaps in shadow form. Whatever their nature, these were folk performances, in part religious rites connected with seasonal festivals and in part joyful entertainment.

The *trott*, *barong*, and *nat*

A number of existing dances and dramatic forms show prehistoric links. In the *trott*, a Cambodian deer-hunting dance, masked dancers representing hunter, demon, bull, girls, and deer enact the ritual of a deer hunt to ensure its success in real life. The Dayak of Kalimantan perform a dance to exorcise sickness. The *barong* dance-drama of Bali is staged by a village in which malicious spiritual forces are believed to have gained dominance over protective ones. By enacting the stand-off battle between the protective Barong lion figure and the destructive Rangda witch figure, the village ritually restores an equilibrium between the contending forces. A local *nat*, or animistic spirit, of which there are 37 in Burma, can be invoked by the dance of a professional "spirit wife," or *natkadaw*, through whom the *nat* communicates with the living. A disputed theory holds that the shadow play began as a ritual in which the spirits of magically powerful tribal ancestors were called to earth, in their natural form as shadows or shades, for advice.

Spreading of styles. Between *c.* AD 100 and 1000, dance and drama in Southeast Asia were profoundly affected by

the introduction of dance style and the vast Hindu historical epics of India. First in Cambodia, then in turn in Thailand, Laos, and Burma, the epic *Rāmāyaṇa* became the source of dance and shadow plays. In Java the *Mahābhārata* dominated, whereas in Bali and Malaysia both epics were popular. Indian influence, however, can be exaggerated. There is no evidence that Sanskrit play texts or written dramatic treatises such as the *Nātya-Śāstra* became known. Strong local performing traditions made it possible to assimilate elements of Indian dance and Hindu stories, and, in subsequent development, Southeast Asian dance and theatre grew ever farther away from Indian styles.

Copper inscriptions from Java identify clowns, actors, musicians, and possibly puppeteers in the 9th century, and epic literature of succeeding centuries contains numerous descriptions of shadow plays that were popular and emotionally gripping. By at least the 4th century, epic recitations were a part of the Brahmanic worship of ancient Cambodia. Carvings of the beautiful *apsaras*, or heavenly dancing girls, adorning the temples of Angkor attest to the importance of court dance in Cambodia between the 10th and 13th centuries.

Accidents of history often carried the performing arts across national boundaries. It is believed King Jayavarman II brought dancers and musicians from Java when he left there in 802 to establish the Khmer dynasty in Cambodia, and shadow puppeteers may have accompanied him as well. Another theory suggests that Cambodia received the shadow play from India by way of Malaysia, through conquest by a Malay prince in 1002. Accidents of war took Khmer dance (and perhaps shadow theatre) first to Laos, when in 1353 a prince who had been raised at Angkor established an independent Lao court at Luang Prabang. Next, it reached the Thai capital at Ayutthaya in 1431, when Angkor fell to invading Thai armies. These returned to their court with the Cambodian court-dance troupe, thereby beginning the traditions of Thai court dance and dance-drama. In 1767 the Thai court was captured, in turn, by the Burmese, who brought to Burma the Thai-modified Khmer dance and created Burmese court drama. By this time, also, Javanese shadow theatre had been taken by colonists to Bali and to Malaysia, from whence it later entered southern Thailand.

Migration of the shadow play

When Indonesia was converted to Islām and Chinese influence became strong in the northern tier of mainland states beginning in the 13th and 14th centuries, existing court dance and dramatic forms were scarcely affected. Instead, new Islāmic plays were devised in Indonesia and Malaysia for shadow presentation and for the doll-puppet theatre. Islāmic influence was very strong in Malaysia, however, and even such pre-Islāmic forms as the shadow play absorbed Islāmic prayers, characters, and themes. Bali was never converted to Islām, and its performing arts are thought to reflect, even today, an older tradition than is seen in Java.

Chinese performing arts came to dominate Vietnam during the 1,000-year rule of northern Vietnam by the Chinese. Long after the Chinese were expelled, Vietnamese kings patterned their dances and opera on Chinese models. In time, however, local Vietnamese melodies and stories took their place alongside those of Chinese origin; and play scripts, at first filled with Chinese loan words, were rewritten in more colloquial Vietnamese.

Popular theatre and Western rule. From the 19th century onward, the incursion of Western culture brought about a variety of developments. A steady decline in the power of the royal courts precipitated the death of court drama in Burma; the shifting of support for dance and drama from the court to national bureaus of education and culture in Thailand, Cambodia, and Vietnam; and the movement of the court dance-drama into the popular theatre tradition in Java. In every country, new popular forms of theatre were created. These were based on historical events, on Islāmic and Chinese stories (but romances rather than Hindu and Buddhist myths), on national heroes fighting colonial rule, and on stories about contemporary events. It was not Western drama that sparked the burgeoning of popular theatre, though these plays were largely spoken dramas interspersed with music and dances. Rather, it was more of an indirect response to colonial rule, which caused an upsurge of nationalist feelings, and to the rapid growth of cities that created large populations without access to either folk or court theatre yet eager for some form of entertainment.

DIVERSE NATIONAL FORMS AND TRADITIONS

Although most of the dance and dramatic forms of Southeast Asia are related at least in the distant past, except in Vietnam and the Philippines, they acquired a very distinctive national and local character over the centuries. An examination of a few of these myriad forms will provide a more precise picture of the dense texture of the performing arts in Southeast Asia.

Cambodia. Court performing arts that had flourished during the Angkor period (802–1431) almost ceased in the centuries following the fall of the Khmer dynasty. Whether there was an organized court life or not is uncertain because of the scarcity of records, but in the 18th and 19th centuries performances in Thai form were produced by the Thai rulers of the western provinces of Cambodia. At Phnom Penh a classical ballet troupe was established by the royal family in the 19th century.

Court styles. The chief court forms are *nang sbek* shadow theatre, *lakon* female dance and dance-drama, and *lakon kawl* male masked pantomime. The puppets of *nang sbek* stand four to five feet in height, have no movable arms, and are manipulated from beneath by two fixed handles or sticks. The standing puppeteer either sways the puppet with his arms or he dances with it. In processional scenes, as many as ten puppeteers parade completely around the screen, front and back. An entire tableau may be carved on one puppet, including several figures, forest scenery, or palace buildings, as if to bring to life the epic scenes carved in relief on the temples of Angkor Wat. Two narrators alternate a slow chant with dialogue. During dance sections, the large *pi phat* ensemble, augmented by a large drum, is played. Only plays based on the *Rāmāyaṇa* are performed, and major puppet figures represent Rāma, his consort Sītā, the monkey Hanumān, and Rāvaṇa, a ten-headed demon king who kidnaps Sītā, Khmer peasant figures have been inserted as rustic clowns in every *nang sbek* play. Performance has religious significance, the gods being invoked and honoured, and a performance may be arranged to assure rain or to halt an epidemic. It is not certain when and how *nang sbek* originated, but it seems probable that it was taken to Thailand in the 15th century and then brought back. This would explain the details of costume and headdress of today's puppets that are in Thai style.

Puppet tableaus

The lithe *apsaras* carved in Angkor's stone show details of the *lakon* style of female dance, but neither these nor other records are evidence that their lively dance was used in relating the epic stories. The 19th-century Thai rulers of western Cambodia reintroduced *lakon* dance and dance-drama, which was indigenous to Thailand as well. At the same time, Thailand's male masked pantomime was brought to Cambodia, as far as is known for the first time, and it became known as *lakon kawl*. Both male and female dance-plays were translated into Cambodian. Recently, costumes and headdresses have been redesigned in the style of the Angkor carvings. The stories, music, dance, and dramatic styles of *lakon* and *lakon kawl* are much like their Thai counterparts.

Popular forms. Lakon bassac, performed by some 20 professional troupes in Cambodia, is a highly eclectic form. Musical selections, dances for female characters, and costuming are borrowed from court *lakon*. The form was created by Khmers living in the Bassac River region of Vietnam. Villains wear Vietnamese costumes and move with Vietnamese opera movements, an evidence of the historical conflicts of the two peoples. Chinese, *Jātaka,* or Khmer stories may be performed. *Pi phat* music alternates with Chinese–Vietnamese instruments and with the Western saxophone and piano. Prince Sihanouk, chief of state between 1941 and 1970, encouraged a few French dramatic productions, but such drama is scarcely known outside the Western-educated elite.

Thailand. Folk *lakon jatri, lakon nai* female dance and

dance-drama, *khon* masked pantomime, and *likay* popular theatre are Thailand's chief performing arts.

Folk performance. *Lakon jatri* began in the south, when male dancer-sorcerers performed, in simple folk style, the *Manora* Buddhist birth story as a dance-play. A troupe of three players was usual. One played the beautiful half-bird, half-human princess, Manora; a second played the hero, Prince Suton; and the third, often masked, played clown, ogre, or animal as needed. Flute, bell cymbal, and drums provided the music. The full *Manora* cycle of plays, staged in a village in the open, could last for two weeks. Probably after the 14th century, some *jatri* troupes moved to the Thai capital, where they established commercial theatres and staged a new all-male drama, *lakon nok* (*nok,* "outside" [the palace]), that emphasized plot and an often obscene humour. Advances in dramatic form were accomplished by court writers of *lakon nok* between 1800 and 1909. *Likay* troupes succeeded and completely supplanted *lakon nok* troupes in the early decades of the 20th century, but such popular *lakon nok* plays as *Sang Thong* ("The Prince of the Golden Conch") are presented today in modified form by the Thai National Theatre.

Bawdy humour

Female court dance-dramas. The *lakon nai* (*nai,* "inside" [the palace]) female dance-drama of the court was created in the mid-18th century from a confluence of three previously separate elements: female court dance, the *lakon nok* drama, and the Javanese *Pandji* stories as subject matter. Romantic episodes from the long *Pandji* tale were ideal for staging in the elegant and delicate style of female court dance, accompanied by songs and the music of a large *pi phat* ensemble. In the unhurried court atmosphere, dance scenes lasted an hour or more, and dance figures might be repeated many times. In time, other stories came to be staged in *lakon nai* and were given other names, but the *Pandji* plays composed by the daughters of King Boromokot (1733–58), by Rama I (1782–1809), and by Rama II (1809–24) remain favourites. In this form, *lakon nai* was introduced into Cambodia within the past two centuries.

Masked mime. Until recent years, a Thai version of the Khmer *nang sbek* shadow play, *nang yai,* occupied an important place in court as a Brahmanic-related ritual performance of the *Rāmāyaṇa.* Thai scholars describe it as the source of *khon* masked pantomime, citing celebrations for King Ramathibodi II in 1515 that included a *nang yai* performance without puppets. Wearing heavy makeup, the puppeteers themselves danced the usual *Rāmāyaṇa* episode as narrators told the story and spoke dialogue. Later, masks took the place of makeup, the screen was eliminated, and *khon* was born. In present-day Cambodia (Kampuchea), one troupe can perform both forms. A number of *lakon nai* elements entered *khon* in later years, so that today a *khon* performance mixes the vigorous, masculine *khon* with gentle *lakon nai* singing style and female dance. All of the Thai dance-drama traditions (*lakon jatri, lakon nok, lakon nai,* and *khon*) are taught at the Department of Fine Arts in Bangkok, and representative plays from them are staged, often mixing traditions, at the Thai National Theatre.

Development of the *khon*

Marie Mattson—Black Star

Rāvaṇa, the demon king, fighting the white monkey Hanumān, in *khon* masked pantomime, Thailand.

Popular plays and puppets. The major popular theatre form is *likay,* which evolved in part out of *lakon nok.* It is now performed by more than 100 troupes in most parts of Thailand. Actors are skilled in improvising not only the dialogue and lyrics but also the plot of a play as well, weaving romantic scenes and fragments of *lakon nai* dance, set to *pi phat* music, into a story from a well-known *Jātaka,* history, or court play. *Likay* plays are set to music of the Lao *khen,* a reed organ, in northeast Thailand. A type of shadow play called *nang talung,* in which a single, seated puppeteer moves small puppets of individual figures with movable arms, is very popular in southern Thailand. The performance technique undoubtedly came from Malaysia, while the plays and the identifying features of the puppet figures, mostly from the *Rāmāyaṇa,* are from Thai *khon* and *lakon nai.* A similar shadow play exists in Cambodia, suggesting that the form travelled from southern Thailand to Cambodia, perhaps in the 19th century.

Laos. From the time Laos became a kingdom in 1353, the performing arts at the relatively small Lao court at Luang Prabang followed those of the more illustrious courts to the south, Angkor in Cambodia and then Ayutthaya and Bangkok in Thailand. Today, Lao dancers study in Bangkok, and the style of dance, music, and drama of the Royal Lao Ballet, the only remaining court troupe in Southeast Asia, is almost identical with that of *lakon nai* in Thailand. It is usual to perform excerpts from the very long dance-plays, the staging of a full-length spectacle being beyond the means of the court at present. Male *khon* dance is known but seldom performed. A number of Lao folk dances are studied and performed by the royal ballet troupe.

Scores of popular troupes perform plays derived from Thai *likay* and set to the lively and melodic Lao folk song style known as *mohlam. Mohlam* balladeers, accompanied by the *khen* (a complex reed organ), have for centuries travelled the Lao-speaking countryside, which includes Laos and northeast Thailand, singing bawdy songs of physical love and weaving into their performance local gossip and bits from the epics and court plays. When *likay* troupes from Bangkok played in northeast Thailand, the *pi phat* music and court dancing were not popular, although the plays themselves were. Enterprising *mohlam* performers then set the *likay* plays to the familiar *mohlam* song style, thereby creating a new popular theatre form, *mohlam luong,* or "story *mohlam.*" Of the *mohlam* troupes, a few large ones are located in major cities in the two countries, but most are small and travel from village to village, performing for a few days or weeks in each.

Balladeers of Laos

Burma. In spite of an old Burmese tradition of spirit dances stemming from animism and early contact with Indian culture, formal theatre did not begin until 1767, with the introduction of Thai *khon* and *lakon nai* to Burma following the capture and sack of Ayutthaya. Burmese courtiers and dancing girls immediately learned the two forms, and the plays were translated into Burmese. Because Rāma was viewed as a previous incarnation of Buddha, pious Burmese were reluctant to alter *khon* scripts. For a time *Jātaka* plays, including *Rāmāyaṇa* episodes, were forbidden to live actors. Instead, marionette troupes doing plays based on *khon* brought the Rāma stories to the Burmese countryside. But the *Pandji* plays were not considered *Jātakas,* and even the first Burmese version, by U Sa under the title *Inao,* departed from its Thai model, thus setting the stage for the creation of court drama, or *zat pwe,* based on myth and legend but capable of being independently developed. The three *zat* written by U Kyin

U portray the futility of political strife and urge a life of Buddhist renunciation. U Pon Nya created a freer form of dramatic verse, and his *Water Seller* is noted for its comparatively realistic treatment of court life.

Court drama ceased after 1866, when the British conquered Burma. Thereafter, drama was staged by professionals in public theatres, primarily in Rangoon. U Pok Ni in *Konmara* (*c.* 1875), U Ku in *The Orangoutan Brother and Sister* (1875), and others created a new type of drama, *pya zat,* that mixed royalty and commoners, emphasized humour, and added songs to appeal to a popular city audience. Hundreds of these works were published. Popular troupes in Burma today perform a long bill of attractions that lasts most of the night. It comprises songs and dances, a new contemporary play, and, as a final number, a classic *zat* in which remnants of old court music and dance are preserved. British touring companies in the late 19th and early 20th centuries brought examples of contemporary European melodrama and some classics to Burma. Subsequently a number of plays were written in Burmese and in English, following Western conventions and without songs or dance. Of these, *The People Win Through* (1950), by former prime minister U Nu, is among the most interesting examples.

Indonesia. The sober, majestic, and profound court arts of eastern and central Java, where Javanese is spoken, include *wayang kulit* shadow theatre, *wayang orang* unmasked dance, and *wayang topeng* masked dance.

Wayang kulit (shadow-puppet theatre), Java.

Shadow-puppet theatre. It is uncertain whether the shadow theatre is indigenous to Java or was brought from India, but the *wayang kulit* technique of having a single seated puppeteer who manipulates puppets, sings, chants narration, and speaks dialogue seems to be an Indonesian invention. Unlike most court arts, *wayang kulit* has had centuries of performance in the folk tradition as well, so that today, with several thousand puppeteers active, it is the strongest traditional theatre form in Southeast Asia.

Plays are set in mythological times, some relating to indigenous animistic festivals and worship of local spirits, some directly dramatizing episodes from the *Rāmāyaṇa* and *Mahābhārata* epics, while the majority—the Pandawa (Pāṇḍav in Sanskrit) cycle of about 100 plays—are essentially Javanese creations in which the five heroic Pandawa brothers are placed in different situations. Three and sometimes four god-clown-servants and a set of ogre-antagonists who are not in the epics at all suggest how far removed the shadow plays are from the epics.

The *wayang* puppeteer works within one of the world's most carefully organized performing arts, making possible a virtually solo performance without intermission, from around nine at night until the gray before dawn. Each play is in three parts, coordinated with three keys of music played by the gamelan ensemble. Certain standard scenes appear in a standard order, though some may be dropped. "Opening Audience" introduces the play's conflict, "Inner Palace" shows the king meeting his queen(s), and in "Outer Audience" the army is dispatched. In "Forest Clearing" the first battle scene occurs, and in "Foreign Audience" the antagonist kingdom, usually one of overseas ogres, is introduced. Concluding part one are "Foreign Outer Audience," in which the second army marches forth, and "Opening Skirmish," a battle scene between the two armies. The puppeteer chooses from among 150 musical selections, matched to scene type, character, mood, or action. The puppet figures are carved to indicate character type and status according to fixed patterns for nose, eyes, gaze, stance, body build, and costume. The puppeteer can choose one or another puppet of the same character, coloured gold or black or with a stern or relaxed countenance, to indicate the mood of the figure in a particular scene. In battle scenes, he develops individual encounters between opponents, drawing upon a repertory of 119 movements that are classified for use by god, female, refined hero, muscular hero, ogre, or monkey. Formula narrative phrases describe famous kingdoms and characters, and battles are preceded by challenges couched in standard phrases. Although the puppeteer works only from a brief scenario, he is able to extemporize each performance, adding contemporary jokes for the clowns and molding the performance to suit the occasion and the audience. He and his supporting musicians and female singers are improvising within completely known, although exceptionally complex and subtle, artistic conventions.

Conventions in puppet performances

This artistic system, developed within the shadow theatre for performance of Pandawa plays, has proven to work so well that it has been widely imitated. The entire body of *wayang kulit* drama was adopted in Bali and in Malaysia. At least 25 other play cycles have been performed in Indonesia as shadow drama within this system, including the *Pandji* cycle (*wayang gedog*), Islāmic Amīr Ḥamzah plays (*wayang menak*), and plays dramatizing the revolutionary struggle against the Dutch (*wayang suluh*). The Pandawa *wayang kulit* repertory was transposed to the doll-puppet theatre (*wayang golek*) in Sunda, the western part of Java, and to dance-drama in eastern and central Java (*wayang orang*) and in Bali (*wayang wong*).

Performances are commissioned for special occasions and usually can be interpreted in religious or mystical fashion. There may be offertory plays at harvest time or animistic, ritualistic exorcisms protecting children from being devoured by the voracious god Kala. In *The Reincarnation of Rāma* the divine attributes of the god Wisnu (Vishnu in Sanskrit) reincarnate in Ardjuna (Arjuna), hero of the Pandawa cycle and ancestor of the Javanese race. The translucent screen can be interpreted as heaven, the banana-log stage as earth, the puppets as man, and the puppeteer as god, and the Pandawas can symbolize the manifold attributes of righteous behaviour.

Wayang topeng. Masked dance was also popular at the eastern Javanese courts (*c.* 1000–1400) and may be re-

lated to ancient animistic masked dance seen throughout the Pacific islands. Later, Indian dance style was assimilated, and sometime after the 15th century at the earliest, the *Pandji* story was dramatized. This is *wayang topeng*, widely performed as both a sophisticated and a folk art throughout Indonesia. Unlike the large-scale unmasked dance-drama, *topeng* dance focusses on interpreting character through solo dance.

Wayang orang. Java's spectacular dance-drama, *wayang orang*, grew out of the strong unmasked dance tradition that is illustrated in reliefs of female dancers carved on the 9th-century Borobuḍur and Prambanan temples in central Java and that produced the carefully cultivated female group dances of the Surakarta and Jogjakarta courts after their establishment in the 16th century. Of the latter dances, two stand out, the almost sacred *bedaja*, which even today is danced only in court surroundings, and the *srimpi*, in which two pairs of girls execute a delicate slow-motion duel with daggers and bows. In the middle of the 18th century, *wayang kulit's* Rāma and Pandawa plays were set to court dance to form *wayang orang*, or "human" *wayang*. The music, narrative, and dramatic organization of the shadow play was kept largely intact, many of the actors' movements mimicking the stiff actions of the puppets, while new dance sections were added. Court performances stopped with World War II, but *wayang orang* continues to be performed by some 20 to 30 professional troupes in major cities. In popular performances, attractive actresses play the roles of such refined heroes as Ardjuna and humour and spectacle take precedence over dance.

Actresses as refined heroes

Ketoprak and ludruk. Two other types of popular theatre, *ketoprak* and *ludruk*, were performed in Java by 150 to 200 professional troupes. *Ketoprak*, created by a Surakarta court official in 1914, evolved into a spoken drama of Javanese and Islāmic history in which the clown figure is a spokesman of the common man. Whereas *ketoprak* is performed primarily in central Java, *ludruk*, a spoken drama that handles mainly contemporary subject matter, is performed in eastern Java by both amateur and professional troupes. Though *ludruk* is relatively realistic, male actors play all roles. Songs and dances, accompanied by gamelan music, are performed between acts in both forms.

Sundanese performing arts. There are three main performing arts in the Sundanese area of western Java. *Reog*, a kind of urban folk performance, can be seen especially in the streets of Jakarta: two or three men improvise popular songs, dances, and dramatic sketches for a neighbourhood audience in this type of entertainment. *Wayang golek* is a performance based on *wayang kulit* but using doll puppets without a screen. Approximately 500 Sundanese puppeteers perform *wayang golek*. Female singers, who are almost as important as the puppeteer, respond to requests and gifts of money by singing song after song and virtually stopping the play. *Sandiwara* troupes in Jakarta, Bandung, and a score of other cities perform both *wayang* stories in the form of Sundanese dance-drama and spoken historical and contemporary dramas for popular audiences. Sundanese-style court dances and *topeng* masked dances are often performed solo at festivals and for circumcision or wedding celebrations in private homes. Sundanese dance is more sensuous than Javanese and broader in style.

Balinese dance-drama. Of the many factors that have contributed to the remarkable flourishing of dance and drama on the island of Bali for more than a millennium, three are of particular note. First, Bali remained isolated from both Islām and the West. Second, there was a merging of folk and court performance styles into a single communal tradition appreciated by all. Third, dances and plays are indissolubly linked to the recurring cycles of local festivals and rituals whereby the well-being of the community is maintained against constantly threatening malicious forces in the spirit world. From the verve and brilliance of Balinese performances it is clear not only that the people like to perform but also that there exists some culturally determined compulsion to do so.

Balinese dance and dramatic forms are so numerous that only a few can be noted. Balinese villagers playing in the *barong* exorcism dance-drama are not merely actors exercising theatrical skills. The actors' bodies, going into a trance, are believed to receive the spirits of Rangda and the Barong, and it is the spirits themselves that do battle. Thus the performance is actually more a ritual than a piece of theatre. The *sanghyang* dance is usually performed by two young girls who gradually go into a state of trance as women sing in chorus and incense is wafted about them. Supposedly entered by the spirit of the nymph Supraba, the girls rise and dance, often acrobatically, though they have been chosen from among girls untrained in dance. The dance's purpose is to entice Supraba to the village to gain her blessing when evil forces threaten. In the *ketjak*, or monkey dance, as many as 150 village men, sitting

Ketjak, or monkey dance, Bali.

in concentric circles around a flaming lamp, chant and gesticulate in unison until, in trance, they appear to have become ecstatically possessed by the spirits of monkeys. This performance, however, has no ritual function of altering an earthly condition.

That the Balinese *wayang kulit* may represent the older style of *wayang*, known on Java before the coming of Islām, is suggested by the less stylized shape of the puppets, by the shorter performing time of four to five hours, and by the simple music of only four *gender*, a bronze instrument similar to a xylophone with resonance chambers underneath, from the gamelan ensemble. In one type of shadow play having a special religious significance, the puppets perform before a screen during the daytime, and the puppeteer is seen in his role as a Brahman priest, bare to the waist. In the *redjang* processional dance, village women symbolically offer their bodies to their temple gods.

Because Balinese performing arts are vitally alive, they change from decade to decade, even from year to year. The *gambuh*, respected for its age, contains elements of dramatic dance, song, narrative, and characterization found in later forms. It is thought dull, however, and is seldom performed, though it is believed to have provided the model for the singing style of popular *ardja* opera troupes and the dance style of the lovely girls' *legong*. *Wayang wong* is analogous to the Javanese *wayang orang*, but masks are worn and the repertory is limited to Rāma plays. Pandawa plays are staged in identical style but are called *parwa*. It has been suggested that these forms also stem, at least in part, from *gambuh*. *Wayang topeng* masked-dance plays are ancient, being mentioned in a palm-leaf document of 1058. The Javanese chronicle of the Majapahit period (*c.* 1293–1520), the *Pararaton*, in

which Ken Angrok is the hero, is a favourite *tapeng* story. This points to the strong influence exerted by Javanese on Balinese arts after the Majapahit court was transferred to Bali in the 16th century to escape Islāmic domination.

Malaysia. The Malay peninsula, in the geographical centre of Southeast Asia, has assimilated repeated intrusions of neighbouring cultures. The dances of the former princely states on the east coast show the influence of Indian nondramatic dance.

The multiform wayang. Rulers from Java in the 13th and 14th centuries and later large colonies of Javanese introduced their *wayang kulit* shadow theatre. The puppets of *wayang Djawa,* or "Javanese" *wayang,* are identical with the two-armed, long-nosed, highly stylized puppets of today's Javanese *wayang kulit.* Those of *wayang Melayu,* or "Malayan" *wayang,* have only a single movable arm and are less sophisticated in conception, which suggests that they are either descended from old Javanese puppets, before both arms were made movable, or are a degeneration of the more complex form. Rāma, Pandawa, and Pandji plays are staged. The puppets of *wayang Siam,* or "Siamese" *wayang,* though manipulated by a single seated puppeteer, represent a Thai conception of the figures from the *Rāmāyaṇa;* and costumes, headdresses, ornamentation, and facial features follow those of *khon.* The plays include Islāmic elements as well, while the chief clown figure, Pak Dogol, is thought to be a recent Malay creation that has supplanted Semar, the Javanese clown of *wayang kulit.*

In a performance, puppets of all types may appear together. Either such Thai instruments as the *lakon jatri* drum and small bell cymbals or gamelan instruments play the accompanying music. Song lyrics can be in ancient Javanese; animistic, Islāmic, and Hindu-derived invocations to the gods are offered in the Thai and Malay languages; and the play proper is in colloquial Malay. Puppeteers once performed throughout the peninsula, including the five Malay-speaking provinces of southern Thailand, but today puppeteers are found primarily in northeast Malaysia.

Multilingual performances

Chinese and popular entertainments. Chinese immigrants introduced various forms of opera during the 19th century. Troupes perform for Chinese Buddhist temple festivals, for local fairs, or on national holidays. In Singapore troupes occasionally perform in public theatres as well. Young people of Chinese descent in both Malaysia and Singapore have little interest in the opera, however, because their Chinese is limited. Occasionally troupes import star performers from Hong Kong or tour Chinese communities in Thailand.

Bangsawan was created by professional Malay-speaking actors in the 1920s as light, popular entertainment. Songs and contemporary dances were added to a repertory of dramatic pieces drawn from Islāmic romances and adventure stories. Troupes travelled to Sumatra, Kalimantan, Sunda, and Java, where their melodramatic plays found large audiences and influenced local performers of *sandiwara, ketoprak,* and *ludruk.* The cinema and television, however, have captured much of this audience.

Vietnam. An indication of the antiquity of the performing arts in Vietnam is a large bronze drum of the 3rd century BC found near Haiphong, in northern Vietnam, which is ornamented with instruments and musicians playing for dancers. Chinese performing arts presumably were a part of court life in northern Vietnam during the period of Chinese rule (111 BC–AD 939), and between the 10th and 13th centuries the dances and music of the Hinduized Cham peoples, living in what is now central Vietnam, were welcomed there. The melancholy Cham songs were particularly popular, and most authorities believe that the sad southern style of Vietnamese singing is derived from them.

Satirical drama. Hat cheo is a popular, satirical folk play of northern Vietnam that combines folk songs and dances with humorous sketches criticizing the people's rulers. Some scholars theorize that it is an indigenous folk art, whereas others, to show that it reached the people from the court, cite the legend of a Chinese actor who in 1005 was hired by the Vietnamese king to teach "Chinese satirical theatre" to his courtiers. *Hat cheo* is widely encouraged by the government.

The opera. The classic opera, known as *hat boi, hat bo,* or *hat tuong,* is a Vietnamese adaptation of the Chinese opera long supported by kings and provincial mandarins as a court art and performed for popular audiences as well, especially in central Vietnam. The introduction of Chinese opera is attributed to the capture of a troupe of performers attached to the Mongol army that invaded northern Vietnam in 1285. The actors' lives were spared in return for teaching their art to the Vietnamese. In 1350 another Chinese performer was engaged by the northern court as an instructor. Almost exclusively a court art in the north, *hat boi* was made a form of popular entertainment in central Vietnam by the playwright Dao Duy Tu in the 16th century. It was introduced to southern Vietnam under the Nguyen dynasty in the 18th and 19th centuries, but its future was jeopardized by the decades of war in the mid-20th century. The last large troupe of court musicians, dancers, and actors at Hue in southern Vietnam disbanded in 1945. The postwar government of the late 20th century did not provide *hat boi* with strong support, and the popular troupes lacked audiences.

Blighting effects of war

In form and content, *hat boi* is a blend of China and Vietnam. Direct imitation of Chinese costume and acting techniques was encouraged under the reign (1847–83) of Emperor Tu Duc and it is probable that the present form of *hat boi* dates from this period. At Tu Duc's court in Hue, the playwright and scholar Dao Tan gathered 300 actors and with them wrote out texts of the standard repertory that previously had been preserved orally. He then had the texts published and distributed them to actors and troupe managers. In the 20th century there has been a movement to loosen the rigid structure of *hat boi* and to reduce the high proportion of Chinese loan words that makes the operas difficult for the ordinary Vietnamese to appreciate.

Following Chinese practice, the operas are classified as military or domestic. The former, which may be derived from Chinese and Vietnamese legend or history or may be purely fictional, concern struggles for power between kings. The Chinese novel *The Romance of the Three Kingdoms* furnishes material for many military plays. The latter, dealing with the lives of commoners, contain humorous scenes alternating with scenes of suffering that are played to the accompaniment of sad southern-style songs. The Confucian ethic of obligation to one's superior—of wife to husband, of son to father, or of subject to king—underlies plays of both types.

Hat boi staging is modelled on conventions of Chinese opera. Actors perform on a stage that is bare except for a table and two chairs. These can serve as a castle, a cave, or a bed as well as for sitting and eating. A single embroidered drop at the rear has an entrance right and an exit left. Costume and makeup indicate character type: black for boldness, red for anger or rashness, white for treachery, and gold as the colour of the gods. Conventionalized mime may be used alone or in conjunction with symbolic properties. The actor mimes stepping over an imaginary threshold or sewing without needle and thread, but he indicates riding a horse by gestures with a riding crop and travels in a carriage when a stage assistant holds flags with wheels painted on them at each side of his body. Percussion instruments accompany stage action, and songs—which may be in falsetto Chinese style, in soft southern Vietnamese style, or in a form of prose recitative—are accompanied by stringed instruments.

The popular stage. Southern-style singing is the basis of another type of theatre, *cai luong,* begun in the 1920s by popular singers who performed plays in which they sang the love lament *Vong Co.* Today, regardless of whether a historical or contemporary play is being performed as *cai luong* or which of many troupes is staging it, this melody will be heard throughout the play many times, underlying different lyrics. *Cai luong* stars are lionized, and the best troupes maintain high artistic standards. Among popular theatre forms in Southeast Asia, only *cai luong* plays are fully scripted and directed as they would be in the Western theatre. In contrast to the operetta form of *cai luong,* modern spoken drama is known as *kich.* It is a young dramatic form performed mostly by amateurs who are trying to put Western dramatic conventions into practice.

The love lament

The Philippines. Whatever indigenous theatrical forms may have existed in the Philippines, other than tribal epic recitations, were obliterated by the Spanish to facilitate the spread of Christianity.

The comedia. The earliest known form of organized theatre is the *comedia*, or *moro-moro*, created by Spanish priests. In 1637 a play was written to dramatize the recent capture by a Christian Filipino army of an Islāmic stronghold. It was so popular that other plays were written and staged as folk dramas in Christianized villages throughout the Philippines. All told similar stories of Christian armies defeating the hated Moors. With the decline of Spanish influence, the *comedia*, too, declined in popularity. Some professional troupes performed *comedia* in Manila and provincial capitals prior to World War II. Today it can still be seen at a number of church festivals in villages, where it remains a major social and religious event of the year. Much in the manner of the medieval European mystery-play performances, hundreds of local people donate time and money over several months to mount an impressive performance.

By courtesy of Philippine Embassy

Comedia, or *moro-moro*, folk drama based on the battles between the Christians and the Moros, the Philippines.

Styles from Europe. Dances and dramas from Spain were brought in, some of which took root. The "María Clara," a stately minuet, and the "Rigodón de Honor," a quadrille, were adopted by local European society for its formal balls. Spain's sprightly operetta, the *zarzuela*, became the favourite light entertainment in Manila and other cities. Professional *zarzuela* troupes continued to flourish in the early decades of the 20th century but had disappeared by World War II. New plays with original music were produced in profusion. A number of them based on topical themes and criticizing American colonial policies were banned.

Western drama is studied and widely performed in both English and Tagalog. There are no professional companies, but amateur university and community groups abound. Western classics and recent popular successes are staged, and in recent years many original plays have been written to celebrate the Filipino heritage.

Visual arts

GENERAL CONSIDERATIONS

Religious–aesthetic traditions. The visual arts in Southeast Asia have followed two major traditions.

Indigenous magical and animist tradition. The first is a complex inheritance of magical and animist art shared by the different tribal peoples of the mainland, where it evolved from Paleolithic origins, and of the islands. Such art gave the peoples who made it a sense of their identity in relation to the forces of their natural environment, to the structure of their society, and to time. It consists of types of potent emblem, mask, and ancestral figures broadly similar to those that hunters and early farmers the world over have used in connection with seasonal ceremonies, life and death rituals, and ecstatic shamanism (belief in an unseen world of gods, demons, and ancestral spirits responsive only to the shamans, or priests). The spiritual powers that the arts name and invoke are local and vary from group to group of the population. The rich formal artistic languages have been subject to successive episodes of influence from inland Asia, but each of the tribal groupings has developed its own artistic language on the basis of a common fund of Southeast Asian thought forms.

Indian tradition. The second major tradition was received from India during the early centuries of the Christian Era, when seagoing merchants from that subcontinent so fertile in ideas were expanding their trading activity. Into many parts of Southeast Asia—especially Burma, Thailand, and the coasts of Cambodia and Indonesia, where Indian traders settled and married into the families of local chieftains—they brought with them a script and literature in the sophisticated Sanskrit language. They also brought a highly developed conceptual system dealing with kingship, statecraft, and hydraulic engineering, integrated and authenticated by profound metaphysical ideologies of Indian pattern, both Hindu and Buddhist. These ideologies claimed to be universal, embracing all human diversity within a cosmic frame of reference. And this explains why the culture was adopted. For there was no Indian conquest of terrain; instead, the Indian conceptions, along with the art that expressed them, were used by dynasties in the colonial kingdoms as a method of overcoming divisions in their population, of centralizing effort, and of uniting their religions into viable states based upon cities. Although the new religious conceptions must have offered deep personal satisfaction to the general population, the architecture and sculpture in stone and bronze in which they were artistically expressed were expensive in materials, labour, and skill and were thus available primarily to patrons who were claiming for themselves a royal (*i.e.*, divine) status and using the resources of art to demonstrate that status.

Why the Indian culture was adopted in Southeast Asia

The Indianizing traditions were continually refreshed by direct influences from India and Ceylon. There can be very little doubt that, during the early centuries after the birth of Christ, Indian artists and craftsmen travelled to work in the distant trading colonies of Southeast Asia, for they would have been needed to set up local traditions with proper formulae and methods. And there can be no doubt either that works of art made in India were continuously exported to the colonial kingdoms, thus keeping the local art styles in touch with developments "at home." It is also clear, however, that within a very short space of time the Southeast Asian kingdoms produced their own distinctive local versions of Indian styles; and some of their work shows skill, finesse, and invention on a colossal scale unrivalled even in India.

Although the art styles were to some extent sectarian, and sectarian partisanship played a part in political events, it was by no means unusual to find Hinduism and different forms of Buddhism flourishing side by side. In both Burma and Thailand, however, dynastic options were early exercised in favour of that particular form of Buddhism known as Theravāda (Hīnayāna), which adheres to the nontheistic ideal of purification of the self to Nirvāṇa. These countries follow the same form to the present day. It was also adopted in Cambodia and southern Vietnam after prolonged and successful periods of Hindu and Mahāyāna (a theistic branch teaching compassion and universal salvation) Buddhist dominance. The strongly Sinicized population of the region around the Gulf of Tonkin, which pushed gradually down the coast of Vietnam to become the modern plains Vietnamese, began to adopt Theravāda Buddhism with its artistic types by about the 13th century AD, partly because this form could be best adapted to its self-contained and antidynastic cellular social structure.

Theravāda and Mahāyāna Buddhism

Relations between the two traditions. Even in those regions where Indian influence became strongly entrenched, the older layers of more primitive religion and artistic consciousness remained very much alive. Indian deities were readily identified with local spirits. The tribal populations retained, as many still do, their old animist customs, especially those connected with fertility and practical magic, often with an art (in perishable materials) in which to express them. These arts were influenced by and exercised a reciprocal influence upon the styles of officially imposed Indianized arts. In many parts of Southeast Asia, where the official Indian styles were not completely established (most of Borneo) or where they died out (colonies in Celebes), in inaccessible areas beyond the reach of dynastic influence, or on isolated islands, primitive styles have survived unmodified. Even in Indianized regions where a strict formula, say, for a necessary building type, had not been imported, a native pattern was adopted into the official canon (*e.g.*, Laos). In the Indonesian island of Bali, which has remained nominally Hindu, the Indian and the folk elements were thoroughly assimilated to each other, producing a quite individual style of both religion and art. In Sumatra and Java, whose populations were gradually converted to Islām from India during the 13th–16th centuries, the primitive cult of the ancestors was revived and encouraged by Muslim rulers, with folk versions of denatured Hindu art adapted to it. Decorative styles based on this art have flourished there and have been officially revivified during recent years. In the Philippines, notably in and around Manila, Spanish Roman Catholic art flourished after the Spanish colonization of 1571.

The royal temple

Artistic styles. The royal temple is the basis for the classic Indianizing styles of Southeast Asia. Each Hindu temple is centred on a shrine, symbolizing heaven upon earth, which is crowned by a roof tower representing the cosmic Indian mountain, Meru, conceived as the hub of creation. Since all the peoples of Southeast Asia already believed the natural habitat of spirits and gods to be a mountaintop, the Indian pattern was readily accepted. The temple usually stands upon a lofty terraced plinth (a block serving as a base), which itself also symbolized a mountain. Towered shrines could be multiplied on the terraces, though one of them remained the principal focus. Within the cell of this main shrine was a sacred image carved in stone or cast in bronze. The local Hindu ruler identified the subject of this image as his transcendent patron, or celestial alter ego. This was normally one of the Indian high gods, Śiva (represented perhaps by a phallic emblem, the *liṅga*) or Vishnu. In Mahāyāna Buddhist kingdoms a royal *bodhisattva* (a being that refrains from entering Nirvāṇa in order to save others) was sometimes adopted to fulfill the same role, a favourite form being known as Lokanātha, or Lokeśvara, Lord of the World. Subsidiary shrines, niches, or terraces sometimes contained subsidiary images, including goddesses representing at the same time wives of the god and queens of the king. These images were worked in smooth, deeply rounded, and sensuously emphatic styles derived from Indian art but with varying inflections characteristic of each region and time. The whole exterior of the shrine was usually adorned with rhythmic moldings, foliage, and scrollwork, with figures representing the inhabitants of the heavens. Ideally, the building was constructed and carved in stone; but, particularly where good stone was not readily available (for example, in Burmese Pagan), it could also be brick, coated and sculptured with stucco after northeast Indian patterns. Temple complexes tended to grow as successive kings strove to outdo their predecessors with the magnificence of their buildings. Hindu rulers, influenced perhaps by vestiges of tribal custom, would sometimes retain their own family's temples and images while destroying those of earlier dynasties.

Buddhism, however, is a religion based on a doctrine of transcendent merit and sustained by an order of monks who have, ultimately, no vested interest in kings and gods. They may, however, take a great interest in the world of spirits and the operations of astrology, just as the local population does, even though they regard such matters as subordinate to the ultimate Buddhist aim of universal Nirvāṇa. Buddhist monasteries, therefore, tended to expand around stupas (domed monuments emblematic of the Buddhist truth, also called pagodas or *dāgabas*) of ever-increasing size and number; the preaching halls, libraries, and living quarters for monks were continually enlarged and repeatedly rebuilt, often as a testimony to the piety of royal patrons. Although, strictly speaking, Theravāda Buddhism has no place for a "divine ruler" whose identity an actual king may adopt, provision was made in legend and in court and monastic ritual for the ruler of a Theravāda country to assume a magical role as the dominant sponsor and patron of the Buddhist truth. His legendary prototype was usually not identified, therefore, with an icon of the enlightened Buddha but with images such as the chief disciple at the knee of the enlightened Buddha, as Prince Siddhārtha (the Buddha-to-be), or figuring in scenes of the Buddha's life that lined the monastery halls and corridors.

Prescriptive formulas for art

Both Hindu and Buddhist art were produced according to prescriptive formulas. If the formulas were not followed, the art was believed not to fulfill its transcendent function. In practice, however, there has been room for styles and types of image to change and develop fairly quickly. Hindu and non-Theravāda art recognized what could be called aesthetic values as a component in religious expression. Theravāda Buddhism, however, which might be called fundamentalist, has always attempted to preserve the closest possible connections with the Buddha's recorded original deeds and sayings; its art, therefore, has concentrated on repeating in its main Buddha figures the most exact possible imitations of authentic ancient images. This had led to a relative monotony of style in Theravāda icons (see below *Burma; Thailand and Laos*). In the subsidiary sculptured and painted figures, however, which illustrate scenes from sacred history, Theravāda art has had greater freedom of invention. In the 20th century, Theravāda Buddhism is the only form of Indian religion to survive in Southeast Asia, save for the modified Hinduism of Bali. Its architecture in recent centuries has been decorated with a vigorous, sometimes coarse fantasy and made gaudy with gilt paint and coloured glass.

General development of Southeast Asian art. Most of the works made under the inspiration of the primitive, magical, and animist tradition are in perishable materials such as wood. Because the climate is so hostile, the works that survive are relatively recent; and any that is even 100 years old generally owes its preservation to Western interest. There are, however, a large number of Neolithic stone implements and prehistoric stone monuments (megaliths), as well as bronzes, which provide a solid archaeological basis for interpretation of Southeast Asian primitive art.

For the art of the classic Indianizing civilizations, French archaeology played the major role in clearing, excavating, and reconstructing major sites in Cambodia, Laos, and Vietnam; Dutch archaeology in Indonesia; British in Burma. Old bronzes have been found in fair quantities; apart from those of the early Dong Son culture (see below *Bronze Age: Dong Son culture*), all belong to one or other of the Indianizing traditions. Many old brick and stucco buildings survive, notably the medieval work at Pagan and in central Thailand, though an enormous number are known to have perished. Little very old painting is known, save a few Indianizing medieval rock and wall paintings on plaster. In spite of the fact that Buddhist monasteries are able to act as agents for preserving their own artworks, most of the surviving Buddhist pictorial art on wooden panels or other fragile material is less than 300 years old.

The stone of dynastic buildings, of course, has survived far the best. Scholars thus know much more about Indianizing stone architecture, with its sculpture, than about any other Southeast Asian visual art. But, where good relief sculpture flourished, one can legitimately assume that vanished pictorial arts also flourished; and from details carved in stone and incised on bronze, as well as from the scattered enthusiastic references in Chinese sources, one can be sure that throughout their history the Southeast Asian peoples have been intensely creative and have lived their lives surrounded by a wealth of imaginative art in many different mediums.

Unexcavated sites

There are many sites yet to be discovered and excavated. Twentieth-century knowledge of the history of art in many parts of Southeast Asia, especially of important episodes in Burma, Thailand, and Sumatra, is still scantily documented.

Neolithic period. The earliest works in Southeast Asia that can be called art are the rectangular polished axheads of a familiar late Neolithic type that have been found at many sites in Malaya, Indochina, and Indonesia. Some of the later Neolithic (*c.* 2000 BC to early centuries AD) implements are extremely beautiful and polished with the greatest care. They include practical adzes and axes; but some, made of semiprecious stone, were clearly intended for purely ritual purposes. Even in the 20th century a few such blades are preserved and revered as sacred objects in certain Indonesian farming communities and similar objects have continued to be made in some very remote regions. These tools, with their fine edges, suggest that their owners were capable of very high quality woodworking and might well have decorated their wooden houses with designs of which we know nothing.

During the Neolithic Period, metal—both bronze and iron—came into use for implements but did not greatly alter the material culture. In many regions, notably Cambodia, Borneo, and Sumatra, numerous works of megalithic, or stone, art survive, including menhirs (single upright monoliths), dolmens (two or more upright monoliths supporting a horizontal slab), cist graves (Neolithic graves lined with stone slabs), and terraced burial mounds, all dating from the late Neolithic epoch. Some remarkable large stones are worked in relief with symbols and with images of animals and men, notably in the Pasemah region of Sumatra. Shaped stone sarcophagi and skull troughs (containers to hold the skulls of ancestors and of enemies at village shrines) are also known. These megalithic art objects suggest a highly developed cult of a spirit world connected with the remains of the dead (see below *Cambodia and Vietnam; Indonesia*).

Bronze age: Dong Son culture (c. 4th–1st centuries BC). By about 300 BC a civilization with elaborate arts based on bronzeworking existed, extending probably from the Tongking region into Laos, Vietnam, Cambodia, and Indonesia. This is called for convenience, after a major site, the Dong Son culture, though it may not have been a true cultural unity. A variety of bronze ritual works, many decorated with human and animal figures and with masks, were cast by the cire perdue method (metal casting using a wax model). The chief objects were ceremonial drums, large and small; the largest was found in Bali and is called "the Moon of Bali" (see below *Indonesia*). Extremely elaborate bronze ceremonial axes were made—probably as emblems of power. Certain relief patterns on the bronzes suggest that "ship of the dead" designs, like those still woven in textiles in both Borneo and Sumatra, may well have been woven even then. The spiral is a frequent Dong Son decorative motif; later Dong Son art was probably responsible for transmitting—especially into Vietnam, Cambodia, and Borneo—versions of the contemporary Chinese Chou dynasty's asymmetrical squared-hook patterns.

1st to 10th century. During the 1st century AD, Indian influence began to spread through Southeast Asia in the wake of trade, both overland, through Burma and Thailand, and by sea traders settled at especially favourable spots along the inland roads and along the sea routes around the coasts and into the islands. Buddhism, which was particularly popular among the Indian merchant classes, took root at a large number of trading cities, where monasteries were set up under the patronage of local kings. Many fragmentary Buddha images based upon Indian types of *c.* AD 300–400 have been found in Burma, Thailand, and Cambodia, produced in the kingdoms of the Mon people, the chief of which, in Thailand, was called Dvaravati. By the 5th century the first Hindu kingdoms had been established in western Java and Borneo. These kingdoms produced dynastic cult images, fragments of which have been found.

The first Hindu kingdoms

Perhaps the most splendid of the earlier Indianizing kingdoms, lasting till the 9th century AD, was that of the Pyu people in the upper Irrawaddy River Valley. The Pyu were the people most directly in touch with eastern India by land routes. Only one of their enormous cities has been explored archaeologically (see below *Burma*). The remains of Buddhist buildings, east Indian Buddhist images, and Hindu sculptures of Vishnu have been found there.

In the 1st century AD the predominantly Hindu kingdom known as Funan (the name given it by Chinese historians) was established in Cambodia. It seems to have controlled an empire that included kingdoms in Malaya and even parts of southern Burma. Its population was probably Mon and shared the culture of the Mon in the lower Irrawaddy Basin. (The Funan kingdom really represents the earliest phase of what became, in the 9th century, the great Cambodian Khmer Empire.) Between *c.* 550 and 680 the kingdom retreated from the coast up the Mekong River into Laos, where it was called by the Chinese Chenla. This joint Funan–Chenla tradition produced some of the world's most magnificent stone cult images. Though Buddhist icons are known, these images principally represent Hindu deities including Vishnu, his incarnation Krishna, Śiva, and a combined Śiva-Vishnu figure called Harihara. The images were housed in wooden or brick shrines, now vanished.

During the Chenla retreat the Theravāda Buddhist kingdom of Dvaravati flourished in southern Thailand, on the lower reaches of the Mae Nam Chao Phraya; the kingdom lasted until the 11th century, when it was captured by the Khmer. What little of its art is known is close to that of eastern India and provided the basis for later Buddhist art in the Khmer Empire, as well as for some of the later forms of Thai art.

The central Javanese kingdom

Almost contemporary with Chenla was the rise of the central Javanese kingdom. Soon after AD 600 the earliest surviving Hindu temples were built. In *c.* 770 the Śailendra dynasty began its long series of superb stonecut monuments both Hindu and Buddhist, which culminate in two enormous symbolic architectural complexes: the Mahāyāna Buddhist Borobuḍur (*c.* 800) and the Hindu Lara Jonggrang, at Prambanam (*c.* 900–930). These monuments were decorated in an individual and exceptionally accomplished style of full-round and relief sculpture. Many small bronze religious images have survived. The art of the Śailendra dynasty testifies to the imperial and maritime power of the central Javanese kingdom, which seems to have influenced politics and art in Khmer Cambodia. It also took over the possessions of a major Theravāda Buddhist kingdom called Śrivijaya, which had flourished in Malaya and Sumatra and was centred at Palembang. The Javanese Śailendra ruled most of Malaya and Sumatra and installed themselves there in the mid-9th century, when their home terrain in Java was taken over by the Mataram dynasty, heralding the eastern Javanese period, which began in 927. Śrivijaya, under Śailendra rule, declined in the mid-11th century, and most of its remains still await discovery.

In Vietnam *c.* the 2nd century AD the predominantly Hindu kingdom of Champa was founded. Its capital was at My Son, where many temples have been found. This kingdom suffered much from attacks by the Chinese, and, after it began to lose the north to the Sinicized Vietnamese in 1069, the Cham capital moved in 1069 to Vijaya (Binh Dinh), in the south. There it was involved in continual warfare with the Khmer, who finally annexed southern Vietnam in 1203. The art of the northern Vietnamese as a whole has always been so strongly under the influence of China that it can best be characterized as a provincial Chinese style.

The Khmer Empire

10th century to the present. In Cambodia the Khmer Empire succeeded to the old territories of Funan–Chenla. About 790 the first major Khmer ruler, Jayavarman II, who was related to the old Funan royal family, came to Cambodia from the Śailendra court in Java. In 802 he set up a religious capital on a hill at Phnom Kulen; he seems to have called in artists from Champa and Java, thus giving to Khmer art a distinct new impetus. At another site, Sambhupura (Sambor), he built temples with sculpture based upon the old Funan–Chenla tradition. At Amarendrapura, about 800, he built a brick pyramid—an artificial mountain—to support a quincunx of temples.

It was Indravarman I (877–889) who laid the foundations of the fabulous temple complex known as Angkor. His plan was based on a rectangular grid of reservoirs, canals, and irrigation channels to control the waters of the river system. Later kings elaborated this original design to a colossal scale. Indravarman built the first great works of Khmer architecture: the Preah Ko, at Roluos, and at Angkor his temple mountain, the Bakong, ornamented with sculpture. Successive kings built their own temple mountains there, including the Bakheng (*c.* 893), Pre Rup (*c.* 961), the Ta Keo (*c.* 1000), and the Baphuon (*c.* 1050–66) and culminating in Angkor Wat, built in the first half of the 12th century by Suryavarman II. After a disastrous invasion by the Cham, Jayavarman VII undertook the most ambitious scheme of all, the Mahāyāna Buddhist Angkor Thom and Bayon (*c.* 1200). Thereafter, for a variety of reasons, including conquest by the Thai, no more large-scale work was done by Angkor and the country became Theravāda Buddhist. The modern dynasty has adapted remnants of traditional splendour, and the craftsmen of Cambodia have remained capable of work in the same vein as but often superior to the Thai.

Hindu Javanese art continued to be made under the eastern Javanese dynasties (1222–14th century), although their structures are not nearly as ambitious as the central Javanese works. There are many temple enclosures and volcanic bathing places with modest stonecut architecture. Some of the stone sculptures from these sites, however, are now world famous. In the 20th century the east Javanese tradition still survives, modified by folk elements, in Bali, to which the east Javanese Hindu kings retreated in the 16th century to maintain their religious independence in the face of Muslim expansion. Muslim monuments in the form of mosques and tombs are found in various parts of Indonesia. They adapt older forms of Indonesian art.

In 1056 the great Burmese king Anawrahta decreed Theravāda Buddhism to be the religion of his country, replacing earlier cults. He removed the Mon monks and artists from the capital of the old Mon kingdom in southern Burma, transporting them to his own northern capital, Pagan. There they built a city, with many large brick and stucco temples (pagodas) based on Indian patterns, that remains one of the most impressive sites in Asia. The Mongol invasion of 1287 put a stop to work there.

The Mon kingdom, Dvaravati, of southern Thailand, was annexed to the Khmer Empire in the 11th century and Khmer imperial shrines were built there. After the decline of the Khmer and the Mongol invasion of 1287, a powerful alliance of racially Thai kings established the first major Thai empire, retaining Theravāda Buddhism as the state religion. Thailand was divided into two principal regions, northern and southern, with capitals, respectively, at Chiang Mai and Ayutthaya, possession of the trade city of Sukhothai being an issue between them. In all the Thai cities, brick and stucco temples were built on variants of Indian and Burmese patterns. Many fine bronze Buddha figures, large and small, were cast in canonical Theravāda Buddhist styles. Most of these figures were accommodated in monastery halls built in impermanent materials.

In both Burma and Thailand a very large number of monasteries, usually surrounding one or two principal pagodas, were constructed during the later Middle Ages and into modern times. The major cities of Rangoon, Mandalay, and Bangkok contain the most elaborate examples, although there are many elsewhere. Because the pagodas were repeatedly enlarged and redecorated and the wooden monastic buildings and their many smaller stupas continuously reconstructed and renovated, no absolute chronology has been established for the arts of this epoch.

In Laos and Vietnam Theravāda monasteries, with brick stupas, were similarly built and rebuilt of wood. An outstanding stupa is the That Luang at Vientiane, in Laos, founded in 1566 but much restored in the 18th–19th centuries. In Vietnam local variants of Chinese styles were adapted during the Middle Ages to the planning and decoration of palaces and of Confucian, Taoist, and Buddhist temples.

The primitive styles that prevailed in the Philippines were modified by the conversion of various groups—the Moro people, especially—to Islām in the 15th–16th centuries. When, in 1571, the Spanish took control, Manila became the capital of a Spanish colony, and Roman Catholic Spanish art was adopted via Mexico. A local school of church architecture and figure sculpture flourished until the 20th century, when Manila became the centre of a modern commercial society, with its attendant architecture and art.

BURMA

One date is crucial in the art history of Burma: AD 1056. In that year King Anawrahta of Pagan decreed Theravāda Buddhism to be the state religion of all Burma. This signalled the unity of what had been a divided country, consummating tendencies apparent in earlier Burmese history.

6th to 11th century. The only major Burmese art known to scholars is based upon Indian and Ceylonese Buddhist art. In the period preceding Anawrahta's decree there had been three major historical eras in what is now the country of Burma, the first two of which produced Indianized art known to scholars only fragmentarily: the rule of the racially Mon kingdom of the lower Irrawaddy (9th–11th centuries), the contemporaneous dominion of the Pyu people in central and Upper Burma, and the subsequent decisive incursion of racially Burmese people from the northeast (11th century).

Major historical eras

The earliest concrete evidence of Indian culture in Burma is a Buddhist inscription from Pye (Prome) dated *c.* AD 500. This and later inscriptions from the same area were cut probably in the western Mon kingdom, which followed Theravāda Buddhism and was confederated with the Theravāda Buddhist eastern Mon kingdom of Dvaravati (see below *Thailand and Laos*) in southern Thailand and part of Cambodia (AD 6th–12th centuries).

During this same period, in Upper Burma, the people called Pyu, speaking a Tibeto-Burman language and perhaps originating in Central Asia, built cities whose magnificence was known to contemporary compilers of the Chinese Tang dynasty history. In the 8th century one city was recorded as being some 50-odd miles (80 kilometres) in circumference, containing 100 Buddhist monasteries lavishly painted and decorated with gold and silver. The Pyu were in direct contact with northeast India, where various forms of Mahāyāna Buddhism, which embraced philosophies and rituals unacceptable to the Theravāda, flourished; their Ari priesthood was later proscribed by Anawrahta. Their capital city, Śrī Kṣetra (modern Hmawza, near Pye), which was once larger than even Pagan or Mandalay, has been partly excavated. Three huge Buddhist stupas—one 150 feet high—survive there. They illustrate the pattern from which all later Burmese stupas were developed. Enshrining revered relics of Buddhist saints, they consist of tall, solid brick cylinders mounted on shallow, circular, stepped plinths and crowned by what was probably a tapering bell-like pinnacle. Other excavated halls, one on a square plinth with four entrance doors, follow Indian examples. A few Hindu fragments survive as well.

The Pyu were conquered by a neighbouring kingdom, probably before AD 900. During the following century their terrain and cities were infiltrated by the racially Burmese people. These people were of common tribal stock with the Thai and northern Vietnamese and were probably on the move under pressure of the Chinese colonization of their home terrain around the Gulf of Tonkin. They were converted to Buddhism by the Pyu and later by the western Mon; but they never completely abandoned their own original cult of nature spirits, known today as the *nats*. The *nats* are a mixed collection of spirits that act supernaturally, each according to its character. The *nats* were worshipped with orgiastic ceremonies and trance rites of spiritual possession. Certain mountaintops were sacred to them. Even in the 20th century the *nats* exert a powerful influence on the lives of the ordinary people; every village has its own *nat* house—a fragile pavilion built into a tree, after the pattern of the tribal house, and adorned with shreds of coloured cloth, glass, and other offerings. The Buddhist temple in Burma is conceived essentially as an enormous *nat* house, a section of the domain of the

spiritual located upon earth. And, since the Buddha was adopted as the last and greatest of the *nats*, the same symbols of supernatural splendour that adorn the *nats* adorn the Buddha's images, and a *nat*-like spirituality attaches to the ubiquitous monks in whom the presence of Buddhism is experienced as an everyday reality.

11th century to the present. When King Anawrahta came to the throne, he captured the Mon city Thaton in Lower Burma and carried off its royal family, many skilled craftsmen, and most of the Theravāda monks to his own northern city of Pagan. The king recognized the superior culture of the Mon captives; he established their main form of Buddhism by decree and gave them the task of organizing and civilizing the new united Burmese kingdom and producing for it a Buddhist art. Under Anawrahta's successor, links with the Buddhist homeland were forged. Embassies were sent to Buddh Gaya, in Indian Bihār, and the great Mahābodhi temple there—marking the spot where the Buddha achieved enlightenment—was restored with Burmese money and somewhat in Burmese taste. A smaller copy, with its large rectangular block crowned by the characteristic pyramidal, storied tower, was built at Anawrahta's Pagan. It is here that the greatest achievements of western Mon art—a splendid profusion of architecture and decorative work—are probably to be found. After 1287, when Burma was sacked and garrisoned by the Mongols, new construction at Pagan was virtually abandoned.

Pagan

In Pagan (founded *c.* 849), architecture is the dominant art; except for the big brick icons, mostly ruined, sculpture and painting play a subordinate role. Pagan contains the largest surviving group of buildings in brick and plaster of the many thousands that once stood in various parts of South Asia. The remains at the site, all religious buildings of one kind or another that must once have been surrounded by dense building in perishable materials, are in varying states of preservation. The inscriptions they bear indicate that royal devotees often turned their palaces over to religious use; so it is likely that palace and monastic architecture were very close in style. A few structures still stand that belong to the period before Anawrahta, some of them inspired by Mahāyāna Buddhism and one—the Nat Hlaung Gyaung (*c.* 931)—by Hinduism. Flanking the Sarabha Gate is a pair of small *nat* shrines with pointed, open windows—the earliest in Burma, perhaps 9th century.

The library, built about 1058 to house the books of one of the Buddhist monasteries, is one of the most important buildings in Pagan. It is rectangular, with a series of five stepped-in, sloping stone roofs crowned by a rectangular tower finial. The concave contours of the roofs are characteristic of much Burmese architecture. The eaves and corners of all the tiers are adorned with the typical Pagan flame ornament, or antefix.

The *cetiya*

There are other buildings of the same general type among the ruins of Pagan. Far the most numerous and important, however, are the buildings—called *cetiyas*—that combine the attributes of stupa and shrine. These have a history and a line of evolution of their own, which can be traced from the Pyu stupa to the huge structural temple. The normal stupa, derived from the early medieval Indian form, is a tall structure consisting of a solid dome set on a tiered square plinth (often with miniature stupas at the corners) around which the faithful may perambulate. The dome is surmounted by a *harmikā*, which resembles the small railed enclosure found on the oldest Indian stupas. In Burmese stupas, however, the *harmikā* becomes a decorated cubical die, above which is a circular pointed spire; in memory of its distant origin in India, the spire is horizontally flanged (rimmed) with moldings in a series of honorific umbrellas of decreasing size. In later practice *harmikā* and umbrella spire become a single architectural unit. The Burmese stupa dome, based on the tall, cylindrical Pyu prototype, has a spreading concave foot resembling a bell rim. The Lokananda and Shwesandaw at Pagan are two well-known examples. Because in recent times they have been coated with plaster, the finely detailed brick carving characteristic of early Pagan architecture has been obscured. Such carving is beautifully exemplified in the Seinnyet temple at Myinpagan (11th century).

Anawrahta's type of *cetiya* followed the general form of the early Pyu stupa. The main point of evolution was in the progressive elaboration of the terraced plinths on which the dome stands. The plinths became virtually sacred mountains, with a series of staircases running from terrace to terrace up each of the four sides. Perhaps inspired by vanished work in contemporary late-11th-century India, the Burmese began to open up the interior of the terraced base of the stupas with wide corridors and porticos, converting it into a roofed temple. The cylinder of the stupa dome was carried down through this temple space to its floor. Four large Buddha icons were added to the lower part of the dome, facing the four directions. Once this conception had evolved, it was possible to create around the central stupa a broad circuit of roofed enclosures, which from the outside would still suggest the traditional pattern of the stupa standing on its raised terraces, while the interior could be used for ceremonial, as in a true temple. Sculpture and painting, decorating the internal halls, corridors, and doorways, recounted the life of the Buddha and presented the example of his previous virtuous incarnations. The most famous example of this type of *cetiya* is the great Ananda temple at Pagan (dedicated 1090). It is still in use, unlike most of the old temples there, and so is kept in repair; it is painted a blazing white with lime stucco—which has, of course, obscured the finer detail of its old architecture. Its plan is square, with a broad, four-pillared porch hall added to all of the four doors in the four faces of the square. Its tower is a curvilinear pyramid resembling eastern Indian Hindu temple towers, and its enormous brick mass is pierced with two circuits of vaulted corridors. The sloping, curved

terrace roofs have an elegant overall concave profile and flame antefixes along all the eaves.

As time went on, Burmese brick and stucco architecture developed principally through the stiffening of masses into rectangular blocks and through the elaboration and often the coarsening of its ornament. The 13th-century Gawdawpalin temple at Pagan, for example, consists of a rectangular hall with a large closed entrance porch; the hall is surmounted by a tall but narrow second story whose decoration repeats that of the lower story; the whole building is crowned by a four-faced tower with a curved profile. Multiple moldings and decorative motifs are used as outlining elements and the doors are framed in elaborate upward-flaring hooded porches.

Until the Mongol conquest in 1287 much excellent work seems to have been done at Pagan. It is, however, impossible to form an adequate idea of the older styles of temple architecture at other sites in Burma, such as Rangoon or Mandalay. Whereas most of the temples of Pagan were abandoned early on, so that even though they may be ruined they show their original characteristics, temples in modern cities have been repeatedly and drastically restored. Old stupas may have as many as eight successive casings of brick and stucco; temple walls and doors are constantly torn down and rebuilt; and stucco surfaces may be renewed almost annually. Such attentions to a religious building are popularly regarded as acts of merit; thus, revered architectural monuments suffer continually from well-intentioned but disastrous renovation. At the big stupa sites huge numbers of pagodas are constantly falling into decay and new ones are being built at great speed. Among them are variants, whose evolution cannot at present be traced, on the basic pattern of the long tapering bell, with a variety of transverse moldings, standing perhaps on a recessed plinth. Many are covered quickly with extravagant and gross stucco ornament. Ornate flaring porches and flame finials are added to gates, wall ends, and eaves corners. A tapering slenderness is the outstanding characteristic of all the different types.

Stupa sites in Rangoon and Mandalay

The monastic architecture—patterned on the hall, with its elaborate doors—that surrounds the great stupa sites of Rangoon and Mandalay is mainly in wood, built by simple pillar and architrave construction. The roofs are steeply gabled, with multiple gables riding over each other on immense carved pillars in the larger halls. The angles between pillar and architrave and the edges of roof gables, tiers, and terraces are filled with flamboyant cartouches (scroll-shaped ornaments) of pierced work, often lacquered and gilt; thus, the whole building may be smothered in repetitive ornamental curlicues. All this ornament has an otherworldly or spiritual significance. Other stupa sites in Burma, where less money has been spent and less ornament added to the buildings, may be more beautiful to the modern eye, with only a few flamboyant antefixes pointing the gables and punctuating the eaves. All over Burma similar buildings can be found; but, while many have been listed, they have been scantily surveyed, and no real study of their complex history has yet been attempted. There may well be a substantial Chinese influence in the construction of some of the wooden halls and pavilions.

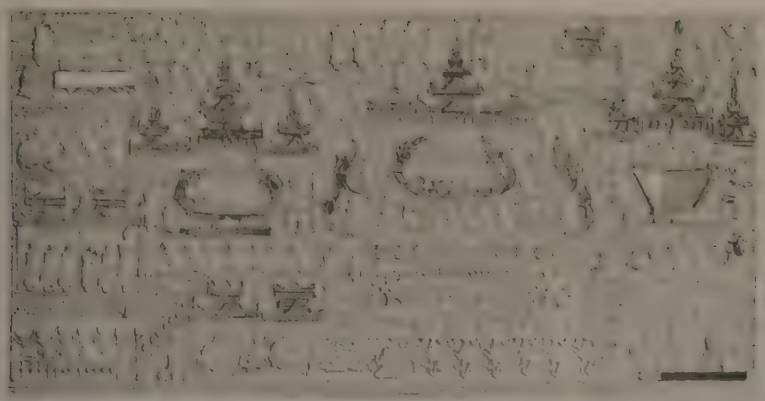
Paintings and sculpture in Theravāda Burma do not seem to have reached the same heights of achievement as in other countries of Southeast Asia. They do not show the same originality and sense of life. The temples of Pagan contain the best examples, although even these are highly schematic, reminiscent in design of eastern Indian Buddhist manuscript styles. A number of early buildings at Pagan contain fragmentary terra-cotta (fired clay) reliefs or scraps of wall painting whose individual figures display some of the sensuous charm of their Indian prototypes (it is quite likely that Indian artists worked there). The 12th-century terra-cotta panels from the elaborate facings of the Ananda temple, however, show the beginnings of the petrifaction that overtook later Burmese figurative art. Both in reliefs and in wall paintings, the figure compositions are reduced to schematic groups of the minimum number of standard human and celestial types needed to tell a moral story, without any infrastructure of significant form and execution. The colossal Buddha images enshrined in the

(Top) Ananda temple, Pagan, Burma, dedicated 1090. (Bottom) Section of the Ananda temple.

(Top) Louis Frederic—Rapho/Photo Reseachers, (bottom) from P. Rawson, *The Art of Southeast Asia*, Thames and Hudson Ltd., London

temples were usually built of brick and finished in stucco, gilded and ornamented. Such work is still done at high speed today. The technique is not a flexible one, and the emphasis of Theravāda Buddhism on the exact imitation of ancient Buddha images gave the Burmese no aesthetic incentive to develop the expression of their figures or compositions. The repeated heavy gilding and repainting of older icons has almost entirely destroyed any formal vitality they may once have had.

From about 1700 to 1850 Burma excelled in the decorative arts, whose forms continually recall those of Theravāda Ceylon. Burmese woven silks and embroideries are well-known. The carved wooden screens, panels, and brackets used inside temple halls, many devoted to representing the *nat*s and the population of the spirit world, have benefitted from being outside the strict canon of Theravāda Buddhist orthodoxy. The figure types follow fluid, slightly "boneless" conventions derived from classical Indianizing dance postures. The decorative goldwares and silverwares, which use much stereotyped decorative scrollwork, are also based on standard Indianizing iconography. Perhaps the most aesthetically satisfying works of the Burmese sculptors are the reliefs ornamenting the *sū-*



Front view of a Burmese *sūtra* chest, wood and gesso, probably 18th century. In the Gulbenkian Museum of Oriental Art, the University of Durham, England. 63.5 × 120.6 cm.

tra chests that were used in monasteries to store the sacred texts of Buddhism. The gilt gesso (paste used for making reliefs) facings of these chests carry the schematic style of relief sculpture beyond its normal aesthetic limits. This is accomplished by the way they are compelled to set off their figures as an intelligible scheme of thin raised lines and inlay against a plain ground. The forms of the fine lacquer bowls and boxes used in monasteries, decorated only superficially with painted ornament, show the underlying formal sense of the Burmese at its clearest.

Regional Burmese art

Interesting regional types of Burmese art are those of the Shan and Karen peoples, who live in the relatively remote northern hills. These areas have often produced extremely beautiful types of domestic and religious architecture, made of wood, on stone bases. They are a simpler and more austere version of the ancient pattern that underlies the halls and pavilions of the more sophisticated recent southern temple buildings, with their steep, gabled roofs. The peoples of the north also produce a variety of decorative arts. Notable among them are the textiles, which are characterized by banding, checkering, and triangular counterchanging of brilliant colours set off against black. The woven shoulder bags, particularly, are well-known in the West.

THAILAND AND LAOS

Dvaravati Mon kingdom: 6th to 11th century. Archaeology has recovered in central Thailand substantial glimpses of the magnificent early layer of Indianized culture, which includes a religious art that was produced between the 6th and 11th centuries by the eastern Mon kingdom of Dvaravati. The art was created predominantly to serve Theravāda Buddhism. Remains of Dvaravati architecture so far excavated include stupa bases: notable examples include the Wat Phra Meru in Nagara Pathama (Nakhon Pathom) and others at Ku Bua and U Thong, some of which have elephants supporting their bases, following a pattern that originated in Ceylon. The plinths of Buddhist assembly halls, which existed near the solid monumental structures, have also been discovered. Many terra-cotta and stucco fragments of decorative surface designs and celestial figures have also been found. The Wat Pra Meru, on a plan similar to that of the Ananda temple at Pagan in Burma (see above *Burma*), probably antedates the latter's foundation (*c.* 1090). It is likely that many other ancient monuments are encased in later stupas that are still being used for religious purposes, for it was probably customary not to destroy an old sacred monument but to encase it in a new shell, maybe several times over, and perhaps to construct a small external replica of the encased original alongside.

At many sites, especially Lop Buri, Ayutthaya, and U Thong, fine Dvaravati sculptures have been found among the architectural remains. Particularly important are the seated and standing Buddha figures in stone and bronze. Many of the faces have characteristic Mon features, with lips turned outward (everted) and downward-curved eyelids marked by double channels. Some of these Dvaravati images may well have furnished models for later Khmer art in Cambodia.

Dvaravati sculpture

Dvaravati sculpture shows close relations with several Indian styles, notably those of Amarāvatī, Gupta, post-Gupta, and Pāla Bihār. It also was probably influenced strongly by the art of the enigmatic kingdom of Śrivijaya in Sumatra, as well as by central Javanese types (see below *Indonesia*). One outstanding masterpiece from Chaiya, of Dvaravati date, may well be a work produced in Śrivijaya. It is a bronze torso and head of a *bodhisattva*, for which a mid-8th-century date is suggested. The body and face are modelled with a plastic and delicate sensuousness; and the elaborate necklaces, crowns, earrings, and armlets are beautifully chased (decoratively indented by hammering). The Śrivijaya origin is made more likely by stylistic reminiscences of the sculpture of contemporary Indonesia, which was also under Sumatran inspiration.

Khmer conquest and Tai immigration: 11th to 13th century. In the 11th century Dvaravati was captured by the Khmer of Cambodia and became a province of their empire. A number of Khmer shrines, probably intended as focuses of the Khmer Hindu dynastic cult, were built in Siam (Thailand). At Phimai (Bimaya) was the most important full-fledged Khmer temple, where one of the personal cult statues of the Khmer king Jayavarman II (see below *Cambodia and Vietnam*) has been found, together with bronze images, some of Tantric Buddhist deities. At Lop Buri the Phra Prang Sam Yot is perhaps the best surviving example in brick and stucco of Khmer provincial art in Thailand, its tall towers having complex rebated (blunted) corners and its porticoes high, flamboyant pediments (the triangular space used as decoration over porticoes, doors, and windows). Wat Kukut, at Lamphun, built by a Dvaravati Mon king *c.* 1130, represents an adaptation of the Khmer stepped-pyramid temple base as pattern for the temple itself. The niches on its terraces are filled with images in a deliberately archaistic revival of the old Mon style.

Domination by the Tai peoples

During the period when the Khmer were taking over the southern Mon region of Thailand, the northern region was falling under the domination of immigrant racially Tai peoples. The Tais were a branch of the migrating population who invaded Burma as the Burmese and of the Sinicized Vietnamese who were then pushing southward into what is now Vietnam. The Tais seem to have professed an animist nature religion, resembling the early form of the Burmese cult of the *nats* (see above *Burma*). This whole group of peoples originated most probably as a tribal population in the region of Tongking and Canton. In the course of their southward migrations they probably played an important role, as yet unclear, in a kingdom called Nanchao, in what is now the Chinese province of Yunnan. The rulers of this kingdom seem to have followed a Mahāyāna form of Buddhism, including the cult of a *bodhisattva* as personal patron of the king. Several smallish bronze icons of a *bodhisattva* with a nude torso and a strap round the upper belly are known from Nanchao, in a style reminiscent of the later Pallava art of the

east coast of peninsular India. The date of these images is still uncertain. Tai kingdoms were gradually established further and further south. Some of their tribes gained experience of administrative techniques by living within the boundaries of the Khmer Empire, with their own chieftains under Khmer officials. When the Khmer power was broken in the 13th century, the Tai moved into central and southern Siam, intermarrying with the Mon.

The Tai people normally built in perishable materials, wood and bamboo in particular. Their animist religion, which has no canonical group resembling the Burmese *nats*, is still very much alive today. The spirits of trees need to be pacified, and the ancestors can be powerful helpers. Shamans, in a state of trance, make contact with the spirit world to perform good or evil magic. In the wooden high-gabled houses of the northern Tai (Chiengmai province), even today, ornate lintels are carved with floral relief designs to sanctify and potentiate the inner domestic part of the house where the domestic spirits live. The animist religion gave ground partially to Buddhism, which was gradually assimilated among the people, and at some date, as yet uncertain, was adopted by the greater Tai kings as a dynastic religion. With the spread of Buddhism a special religious architecture in brick and stucco was established.

Division of Siam

The Thai kingdom: 13th to 17th century. During most of its history, Thailand has been divided into two fairly distinct regions, a northern and a southern, the capital of the north at Chiang Mai, the capital of the south at Ayutthaya. Between the two lies the great trade-route city of Sukhothai, possession of which fluctuated between the north and the south. Sukhothai seems to have been the principal focus and source of Buddhist culture in Siam, for it retained direct touch with Ceylon, which, after the decline of Buddhism in India in the 12th century, became the principal home of Theravāda Buddhism. By the 15th century the difficult art of casting large-scale Buddha figures in bronze had been mastered in the north of Siam, as well as in the south.

Sculpture. The Thai kings made repeated attempts to "purify" their conservative Theravāda strain of Buddhism, importing patterns of art along with texts and learned monks from Ceylon and trying to wean their people from worship of the spirits. To retain the greatest spiritual potency, Buddha icons in Thai temples had to be as close in type as possible to a great original prototype that Buddhist tradition erroneously believed had been made during the lifetime of the Buddha; in practice, this meant the types the local craftsmen knew as the oldest and most authentic. There were at least three major successive efforts by Thai kings to establish and distribute an "authentic" canon for the Buddha icons, which were their prime artistic concern. Each type that became canonical and was known to be magically effective was imitated repeatedly. For it was regarded as an act of merit simply to multiply images of the Buddha, whether they were to be installed in temples or not; hence, in addition to icons, enormous numbers of small images—made of many materials, from bronze, silver, stone, and wood to terra-cotta—were kept in temple storehouses. The images followed canonical patterns established for the major temple icons.

Since their work had to be as similar as possible to the oldest sacred images of which they knew, the Buddhist sculptors in Siam adhered to strict formulas and diagrams; artistic development was never a part of their purpose, though of course gradual change did occur. There is no tradition in Theravāda Siam in any way resembling the traditions of Mahāyāna art in, say, Cambodia or Indonesia, which encouraged artists to explore the possibilities of their mediums to express developing religious conceptions. Thus, Thai Buddhist sculpture consisted almost entirely of careful repetitions of the standardized types, which tended naturally, despite the artist's desire to capture an authentic sense of style, to lose their older vitality. It also happened that the three main canonical patterns often lost their individuality, blending into each other. Perhaps the best works were made in the 15th century, but work of high quality was still being done in the 16th and early 17th centuries.

Canonical types of Buddha image

The first canonical types were the Sukhothai, which seem to have been evolved in the trade-route city of Sukhothai as an attempt to capture the quality of early-medieval Ceylonese images and elements from Dvaravati sculpture. The developed versions of these types are marked by an extremely smooth, rounded modelling of the body and face, without any clearly defined planes. The outlines of hair, eyebrows, lips, and fingers are elegantly recurved, or S-curved, and the head is crowned by a tall, pointed flame finial. The entire figure gives an impression of great elegance. Full-fledged Sukhothai images of the full-round walking Buddha—an original Sukhothai invention—emphasize a kind of swaying, sinuous, boneless grace in the execution of the legs and arms. One of the most impressive colossal images of the type is the brick and stucco icon at the Wat Mahathat, Sawankhalok, another Sukhothai technical forte, dating probably to the 14th century. This type of image remained the most popular in Siam; an enormous number of imitations, of all dates, are preserved, many in Western collections.

Perhaps the Buddha types most successful aesthetically were those called after U Thong. They were produced originally in the southern capital of Ayutthaya, which took over Sukhothai in 1349, and represent a fusion of the Sukhothai types with vestiges of Khmer and Theravāda Dvaravati traditions, whose Buddha types had been marked by a strong Mon sense of squared-off design and cubic volume. The latter may have been influential because they seemed to incorporate an older and more authentic tradition, since they were based upon patterns developed in eastern India, the true homeland of Buddhism. In the U Thong style the sinuous linear curves, loops, and dry ridges of the pure Sukhothai patterns are suppressed, and genuine modelling, with clearly defined

planes and volumes, appears. In the northern kingdom a crude version of the Sukhothai type gained currency in the late 14th century. When, in the middle of the 15th century, King Tiloka of the northern kingdom reestablished contact with Ceylon, images seem to have been imported directly from that country. They must have shown clearly how far the Sukhothai types had departed from the type used in the Buddhist homeland, because the third Siamese icon pattern, known as the lion type, attempted to recapture the stern simplicity of the genuine Sinhalese images. Most of the best examples were made between 1470 and 1565. Limbs and bodies are given a massive cylindrical strength, and the Sukhothai elegance

is eliminated. It seems, however, that the native Thai genius is for the sinuous and unplastic curve, which may have expressed for them the same spiritual unworldliness as it did in Burmese ornament. Thus, in later examples reminiscent of the lion type, the curvilinear patterns of the Sukhothai style reassert themselves with more or less emphasis; and by the end of the 16th century the lion type had lost its distinguishing features and merged into the run of Sukhothai patterns.

Architecture and painting. There are as yet few results of authenticated research available concerning the history of architecture during the early period of Thai supremacy. Many monasteries contain stupas, or *cheddis*, that either originated or were renewed in this period; but most of the monasteries themselves have been repeatedly overworked. Building complexes seem to have developed by accretion, rather than by the studied working out of space articulations. The oldest building in Ayutthaya, dating from the early 13th century, is the Wat Bhuddai Svarya, a towered shrine, approached by a columned hall. From the late 14th century onward, Sukhothai influence seems to have predominated everywhere. The architectural types included a bell-shaped reliquary stupa with a circular flanged base and onion finials, reminiscent of combined Ceylonese and Burmese patterns; a stupa raised upon a cylindrical shrine as its drum; and a shrine with a plinth faced with images (usually later additions) above which rise one or more pyramidal towers reminiscent of the tower of the Mahābodhi temple at Buddh Gaya in Bihār, India. An example of the third architectural type is King Tiloka's late-15th-century Wat Chet Yot at Chiang Mai, which has one large and four smaller pyramids mounted on a main block.

14th-century architectural types

Louis Frederic—Rapho/Photo Researchers

Wat Chet Yot, Chiang Mai, Thailand, late 15th century.

The Thai kings also adopted something of the personal funeral cult of Khmer Angkor (see below *Cambodia and Vietnam*), for a custom grew of building bell-shaped brick stupas—which had earlier been used only for the relics of Buddhist saints—as the kings' tombs, each approached by a colonnaded hall and surrounded by smaller stupas or shrines. In many of the brick and plaster or wooden monastic buildings of more recent centuries, such as the Wat Po in Bangkok, one can trace the distant influence of the Khmer styles of Angkor. Tall, gabled roofs, with steps and overlaps, the gables adorned with flame finials, are typical, exemplified by the Water Pavilion at Bang Pa-in.

Water Pavilion, Bang Pa-in, Thailand, 1294.

Luc Bouchage—Rapho/Photo Researchers

Thai painting of the early period (13th–16th centuries) demands a great deal more research and study than it has yet received. Although it is, of course, devoted to the canonical iconography of the Theravāda, its fluent and relatively unschematic outline shows that it retained much of the original inspiration visible in the earlier work at Burmese Pagan (see above *Burma*). The oldest examples of Thai painting are the much-ruined frescoes in the Silpa cave, Yala, and some engraved panels from Wat Si Chum, Sukhothai, dated to 1287. Later paintings (dating to the 1420s) in the inner chambers of the Wat Rat Burana and Wat Mahathat at Ayutthaya show strong Chinese and perhaps Khmer influence in their high perspectives and landscape backgrounds with animals, combined with the native Thai clear outlines and bright, flat colours. By the 17th century at, for example, the Wat Yai Suwannaram at Phet Buri, large mural compositions—such as an elaborate scene of demons worshipping the Buddha—were being undertaken. In this later painting, theatrical stereotypes from the Thai dance-drama exerted a strong influence in the rendering of figures.

18th century to the present. In the 18th century the Burmese invaded and conquered Siam. The Burmese king—in expiation, it is said, of his war guilt—ordered the construction of many Buddhist buildings in the current Burmese style (see above *Burma*). These made their impact on Thai art, and the gaudy gilding and inlay characteristic of late Burmese ornament were widely adopted. When the capital was moved to the present Bangkok, in 1782, no substantial artistic development took place, though large pagodas were built and filled with rows of images, many in gilt wood. A highly ornate interpretation of older, airily flamboyant Burmese decorative styles, featuring curved "oxhorn" projections, blunted the edge of architectural and sculptural quality. Without exception, the new large-scale icons were dull and inferior works of art; and the monstrous guardian figures of spiritual beings and lions decorating the major shrines are fantastic rather than aesthetically valuable. In the painting of wooden panels, some of them votive, and of historical manuscripts, the Thai retained a good deal of their older vigour. The figures illustrating legend and history are based upon the unworldly stereotypes of the court dance.

Burmese influence on Thai art

In addition to the incorporation of European motives, many buildings and their ornamentation in Bangkok have a strongly Chinese flavour. This is attributable partly to the influence of the large expatriate Chinese population

Sawankhalok, Sukhothai, and Chiang Mai pottery

living there and partly to the influence of earlier expatriate Chinese craftsmen. The early 20th-century Pathamacetiya at Nagara Pathama (Nakhon Pathom), which is entirely orange, is a fine example of the many *cheddis*. Some tiles were certainly imported from China, but others were descendants of the fine pottery (of basically Chinese inspiration) that was produced at the kilns of Sawankhalok during the 14th and 15th centuries by expatriate Chinese craftsmen. This pottery imitated in its own materials Chinese Yüan dynasty (1279–1368) Tzu-chou and celadon wares (stonewares and porcelain with a glaze developed by the Chinese) with underglaze ornament and blue or brown painted decoration. Similar wares were made in the 15th century at kilns at Sukhothai and at Chiang Mai. Some of these pieces are, in their own idiom, as fine as native Chinese work. Later, during the 18th and 19th centuries, somewhat garish, flamboyant Ayutthaya figure designs in polychrome were applied to rice bowls and other vessels.

Laos. The kingdom of Lan Xang (Laos) was founded in the mid-14th century and ruled by Buddhist Thai. At the northern capital, Luang Prabang, the influence of the northern Thai city of Chiang Mai predominated; in the southern capital, Vientiane, a mixture of Ayutthaya and Khmer motives prevailed. In Laos there is no stone and little brick architecture. The most impressive single monument, the brick and stucco That Luang in Vientiane, founded in 1586 but much restored, is a stupa, shaped as a tall four-faced dome on a square plinth enclosed in a court; the dome is crowned with an ornate spire and encircled by a row of similarly shaped spires. The architecture of monastic halls also follows the Thai pattern; very steep multiple-gabled roofs, gently curved and overhung with long eaves, are carried on brick or wooden pillars and adorned with flame finials. Buddha figures, preserved in some of the monasteries, are based on northern Thai versions of Sukhothai types; some may be as early as the 17th century. The schematic paintings on monastery walls are in versions of the later Thai styles. In the northwest a strong influence from late Burmese art can be found in Buddhist images made to serve a religion that was far closer to the original Thai animism than to true Buddhism.

CAMBODIA AND VIETNAM

Paleolithic tools similar to types found in India have been found in Cambodia (Kampuchea) and Vietnam; and it is possible to trace the movement of population or culture groups, some of whom probably migrated onward by sea from Southeast Asia into the islands. The important group of speakers of Mon–Khmer languages may conceivably have been the people who produced the megalithic monuments in Cambodia and Laos, which include colossal stone burial urns, dolmens, and menhirs, perhaps associated with the many circular earth platforms as yet unexcavated (see above *General development of Southeast Asian art*). Probably contemporaneous, at least in part, with the Neolithic Mon–Khmer culture is the culture known by the name of its richest, most northerly site, Dong Son, on the coast of the Gulf of Tonkin in northern Vietnam. It seems probable that the chief influences on this culture came from southern China. Many sites, ranging in date from about the 4th to the 1st century BC, stretch southward from the coast of Vietnam, as far as northern New Guinea. The islands of Indonesia and parts of Malaya may have been the principal location of the Dong Son culture.

Bronze drums

The most impressive bronze objects produced by this culture are large drums, which seem sometimes to have been buried with the dead. Splendid examples have been found in Java and Bali (see below *Indonesia*). These and many other bronze objects, such as superb funeral urns with relief ornament based on squared hooks, lamp holders, dagger hilts in the form of human figures, and other weapons, are of extremely high quality. Their ornament was produced by the Chinese casting technique of incising the patterns into the negative mold that was to receive the molten bronze; much of it suggests a parallel version of contemporary Chinese ornament of the Ch'in period (221–206 BC). From the figures and objects represented in this bronze work, it seems that the Dong Son culture had much in common with that of some of the peoples

Lamp holder from Lach Truong, Vietnam, bronze, Dong Son culture. In the National Museum, Hanoi. Height 33 cm.

of the Melanesian islands today. The culture knew large seagoing canoes, houses similar in structure to those still common among peoples of Melanesia, and ceremonies that the Melanesians might recognize. It is probable that one group of their descendants, which retained its identity, is known to the history of this region as the Cham (see below *Vietnam kingdom of Champa*).

Although many peoples isolated in the densely forested uplands also retained a tribal identity, by far the most important art was produced in the two Indianizing empires: Khmer, in Cambodia, with its linear predecessors the kingdoms of Funan and of Chenla (names they were given by Chinese historians), and the Cham, in Vietnam.

Cambodian kingdoms of Funan and Chenla: 1st to 9th century. Funan, which was in existence by the 1st century AD, was the earliest of the kingdoms that arose along the lower reaches of the Mekong River in response to Indian ideas. Its influence probably extended over long stretches of the coast of the Gulf of Siam, even as far as southern Burma, and corresponded with the range of the Mon peoples. Lying on the natural focus of land and sea routes linking eastern India and southern China to the islands of the South Seas, its geographical situation was ideal for a kingdom whose wealth was based on trade. At Funan sites even Roman, Ptolemaic Egyptian, and Sassanian Persian objects have been found, giving an idea of the extent of its trading interests.

The founder was probably a Brahmin trader from western India; for a local legend describes how the first king, a Brahmin, married the daughter of a local serpent deity, so establishing the ruling family. Serpents (*nāgas*) in Indian mythology are the spiritual patrons of water; and the basis this kingdom laid for later kingdoms in the same area was an elaborate system of waterworks, canals, and irrigation channels controlling and distributing the waters of the Mekong River. Contemporary Chinese accounts refer to cities with splendid wooden buildings, carved, painted, and gilded. But nothing remains, save a few foundation piles. Probably during the 6th century AD the kingdom called Chenla was established in the upper-middle reaches of the Mekong River, in what is now Laos. The kings who ruled in Chenla were descended from the kings of Funan and took over much of the Funan domain. It seems that disastrous floods had finally ruined Funan, which had previously suffered from Indonesian aggression, and that the shift of power to Chenla represented a recognition of temporarily insuperable geographical difficulties.

Stone sculptures

Culturally, Funan and Chenla are continuous. Their artists produced some of the world's greatest stone sculptures, most of which are large, freestanding icons, carved in

sandstone. Intended to be installed in brick-built shrines, none of which survive, they usually represent the two major deities of Hinduism, Śiva and Vishnu. Sometimes both deities are combined into a single figure called Harihara; the right half of the body is characterized as Śiva, the left as Vishnu. A few examples of other figures are known, including some magnificent images of goddesses. The style of these sculptures is marked by an extremely smooth, continuously undulating surface, given strength by a system of clear, broad frontal planes and side recessions related to the foursquare block. Such images were meant to demonstrate the power and charm of a heavenly prototype to whom an earthly king appealed for his authority. The earliest images belong to the 6th century, and the series continues into the 9th.

In later Khmer times each king and sometimes each member of a royal house had statues of himself or herself in the guise of a patron deity set up in the family temple precinct. That the same custom prevailed in 6th-century India, particularly in the southeast, suggests that some of the early Funan and Chenla sculptures may have served the same function. A number of figures are Indian in style—some more markedly than others, which is probably more than a matter of date; for it is quite likely that Indian craftsmen occasionally travelled into this region to work. The style of the greatest of these early sculptures, however, is not Indian at all.

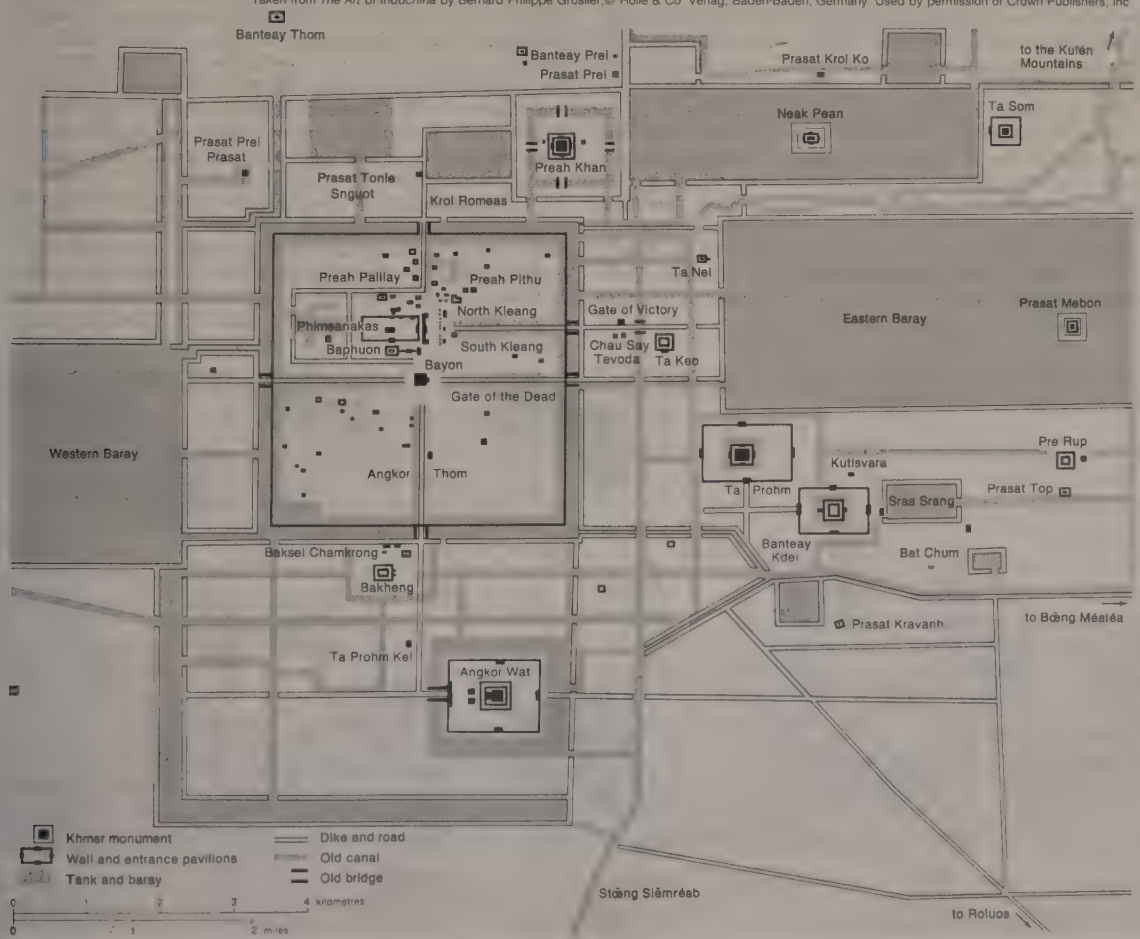
Sandstone lintels

Similarly non-Indian are the magnificent sandstone lintels made for the doorways of the vanished brick shrines. Although distantly related to Indian prototypes of the 1st and 2nd centuries AD, they appear as full-fledged Indochinese inventions and may well have been developed in combination with a native conception of the lintel as a special attribute of the spirit shrine (see above *Thailand and Laos*). They are carved in relief with designs based on a pair of monsters, one at each end, which are linked by an ornate arched or lobed beam. The beam is adorned with figures inside foliate plaques, a long sequence of elaborately carved swags of jewels hanging beneath them.

Among the Funan–Chenla sculptures are a few Buddhist icons executed in sandstone, markedly less sensuous than the Hindu figures and close to the styles of Dvaravati (see above *Thailand and Laos*), though a number of small Buddhist bronzes representing *bodhisattva*s approach the delicacy of the Hindu work.

Kingdom of Khmer: 9th to 13th century. Late in the 8th century the kingdom of Chenla declined politically, perhaps because of dynastic disputes with the rising power of Indonesian kings, who were themselves also descended from the original royal dynasty of Funan. It seems that the Indonesians gave some assistance in establishing a new kingdom in the northern part of what had been the territory of Funan. In 802 a Khmer king, who took the title of Jayavarman II, established his capital near Phnom Kulen, about 20 miles (30 kilometres) from Angkor. It was a rather unsuitable place for an administrative capital, but it was a mountain, and the peoples of Southeast Asia have always believed that gods and spirits dwell on mountaintops. The image of the sacred mountain thereafter remained the inspiration for all the later architecture of the Khmer around Angkor. Jayavarman, who built other temples in the vicinity, seems to have revived the Chenla style. A distinctively Khmer art, however, began to emerge under Indravarman I (877–889), who expanded the boundaries of the Khmer kingdom and finally settled its administration. Most important of all, he developed the initial plan of the colossal city of Angkor, whose mysterious ruins, lost in dense jungle until very recently, have tantalized Western travellers for three centuries.

Angkor was not only a city; more important, it was an immense technological achievement, from which the agricultural prosperity of the whole Cambodian plain derived. This plain was well watered naturally, but its rivers were subject to strong seasonal fluctuations. Controlled,



Plan of Angkor.

Technological significance of Angkor

they were capable of producing an enormous increase in fertility. Angkor was thus essentially an elaborate system of artificial lakes, canals, and radiating irrigation channels that watered a huge acreage of rice paddy; and it was the basis for the strength and prosperity of the Khmer Empire. Since Angkor itself was the technical source of the life-giving agricultural water controlled by the king, it was regarded by the Khmer with religious reverence. Its temples and palaces were an expression of that reverence and at the same time an essential part of its supernatural mechanism. Royal intercession by numerous ceremonies, some of which re-enacted the primal marriage of Hindu divinity and native earth spirit on the pattern of ancient folk cult, ensured the continuing gift of the waters of heaven. The king, an earthly image of his god, was the intermediary who ensured that his kingdom would continue to receive divine benevolence in the form of water in controlled quantities. Courtiers played roles at once religious and administrative for the king, who believed that after his death he would be united with his patron deity. Dedicatory statues were often set up in his chief temple to commemorate his divinization.

In order to conform with mountain mythology, the Khmer kings built themselves a series of artificial mountains on the Cambodian plain at Angkor, each crowned by shrines containing images of gods and of themselves, their family, and their ancestors. The huge platforms of earth on which these buildings were founded probably consist of the soil excavated in forming the lakes, moats, and channels that not only divided up the city but also provided an easy means of transport. The temple mountains, like the city itself, are oriented east to west, the main gates facing east. Each king strove to outdo his predecessor in the height, size, and splendour of his temple mountain. The earlier ones, therefore, are relatively small, though beautiful, while the later ones, such as Angkor Wat and the Bayon, are of stupendous size.

The basic pattern of the Khmer temple mountain

In the basic pattern of the Khmer temple mountain the principal overall enclosure, which is square or rectangular, is at ground level. Within it the artificial mountain rises through a series of terraces and at least one further enclosure wall toward a flat summit. On the summit stands either a single shrine or a group of shrines, often a quincunx—five shrines, one at each corner and one in the middle of a square. Arranged along the terraces or within the enclosures there may be further shrines, whose arched doorway pediments refer to the rainbow bridge between heaven and earth. There may be other long buildings, perhaps used as libraries or administrative offices. A principal staircase runs directly up from the east gate to the summit, and sometimes subsidiary staircases run up from other gates at the cardinal directions.

The architecture of the shrines themselves is relatively simple; it is based upon patterns invented in India, though the ornament of the shrines is often highly developed and characteristically Cambodian. Fundamentally, each shrine consists of a cell whose internal space is cubic and whose external walls are marked by moldings at top and bottom. The shrine is roofed by a pyramidal tower composed of a series of similar but diminishing tiers, each of them a compressed version of the exterior pattern of the main shrine volume. Depending on which Indian pattern is followed, the cell has one main door with an elaborately carved portal or, if the plan is cruciform, four entrances. The earlier shrines were built of brick, most commonly with stucco ornament and figures on the outside. The later shrines were built of stone, with all their ornament and figurative sculpture carved in relief. The moldings on the roofs of the shrines and the decoration of the roofs of many of the subsidiary buildings are extremely elaborate. There are long panels of dense foliate ornament, and the niches in which the sculptured relief figures of celestials are set are framed in flamboyant ogival (contoured like a pointed arch) moldings crowned by no less flamboyant foliate ornament; the smaller architectural features, such as niche pilasters, are elaborately carved and molded. The figures themselves wear gorgeous jewelry and chignons. The massive stone icons that survive in some of the shrines and on the terraces do not have the subtlety or strength of the Funan–Chenla sculptures. Instead, they have an inflated massiveness, intended, no doubt, to make them awe-inspiring. Among the lesser relief figures of celestials, which decorate the walls of the shrines, one finds a more sensuous touch; for many of these celestials represent *apsaras,* the celestial girls of Indian mythology.

Relief panels

On some of the temple mountains there are also relief panels illustrating various aspects of the royal mythology. Episodic relief sculpture first appears on Banteay Srei (10th century). The relief revolves around a series of Indian legends dealing with the cosmic mountain Meru as the source of all creation and with the divine origin of water. The chief artistic achievement of its architecture is the way in which it conceives and coordinates the spaces between the walls of the enclosures, the faces of the terraces, and the volumes of the shrine buildings. A most sophisticated architecture of full and empty space, it seems to have been influenced by that of the Hindu Pallava dynasty in southeastern India.

The earliest more or less complete example of a shrine complex devoted to deifying the ancestors of a king is the Preah Ko at Roluos, near Angkor, completed in 879. The earliest surviving temple mountain at Angkor itself is the Bakong, probably finished in 881. In the central shrine at the summit was a *linga,* the phallic emblem sacred to

Asie Photo—De Wys

Angkor Wat, Angkor, Cambodia, mid-12th century.

Śiva. Around the base of the terraced pyramid stood eight large shrines inside the main enclosure, with a series of moats, causeways, and auxiliary sculptures guarding the approaches to the exterior. The Bakheng, begun in 893, had an enormous series of 108 tower shrines arranged on the terraces around the central pyramid, which was crowned by a quincunx of principal shrines. The whole was intended to illustrate a mystical conception of the cosmos, very much on the lines of the great temple mountain at Borobudur in Java (see below *Indonesia*). Pre Rup, dedicated in 961, was probably the first of the temple mountains intended as a permanent shrine for the divine spirit of a king after his death. It, too, has a quincunx of principal shrines, but it is distinguished by the large number of auxiliary pavilions arranged along both sides of the inner enclosure wall.

From about the same period is perhaps the most beautiful—and most beautifully preserved—of the early Khmer temples, Banteai Srei. This was actually a private foundation, built some 12 miles from Angkor by a Brahmin of royal descent. Its auxiliary buildings, all of sandstone, are adorned with a profusion of elaborate ornament and relief figure sculpture. The roof gables, in particular, are treated with antefixes of fantastic invention. Its principal icon, a huge sandstone sculpture of the god Śiva, seated with his wife Umā on his left knee, is perhaps the most impressive full-round sculpture from the whole Khmer epoch. It differs from 10th-century Khmer official sculpture, which began to take on a conventional and relatively insensitive massiveness.

The Baphuon temple mountain (1050–66) is unfortunately almost completely destroyed. It was a vast monument 480 yards (440 metres) long and 140 yards (130 metres) wide, approached by a 200-yard (180-metre) causeway raised on pillars. Its ground plan shows that it was no mere assemblage of buildings but a fully articulated structure. In this it must rank as the immediate prototype for the great Angkor Wat. Built by Suryavarman II in the early 12th century, Angkor Wat is the crowning work of Khmer architecture, the culmination of all the features of earlier styles.

Angkor Wat

The enormous structure of the Wat is some 1,700 yards (1,550 metres) long by 1,500 yards (1,400 metres) wide. Surrounded by a vast external cloister, it is approached from the west by a magnificent road, which is built on a causeway and lined with colossal balustrades carved in the likeness of the cosmic serpent, associated with the sources of life-giving water. The Wat rises in three concentric enclosures. The western gate complex itself is nearly as large as the complex of central shrines, and both are subdivided into smaller, beautifully decorated courts. Only five of the original nine towers still stand at the summit; although they follow the basic pattern of the Khmer roof tower composed of diminishing imitative stories, the contour of the towers is not rectilinear but curved, so as to suggest that the stories grow one out of another like a sprouting shoot. All the courtyards, with their molded plinths, staircases, porticoes, and eaves moldings, are perfectly articulated enclosed spaces. The symbolic meaning of the Wat is clear. Its central shrine indicates the hub of the universe, while its surroundings—the gate complex, the cloister, the city of Angkor itself, and, finally, the whole visible world—represent the successive outer envelopes of cosmic reality. That it is oriented toward the west—and not to the east, as was customary—indicates that its builder, Suryavarman II, intended it as his own mortuary shrine; for, according to Indochinese mythology, the west is the direction in which the dead depart.

The sculptors who worked at the Wat demonstrate little ability in carving in the full round. Such full-round figures as there are—the guardians on the terraces, for example—lack life. The relief sculpture, however, is magnificent and full of vitality. The open colonnaded gallery on the first story contains over a mile of relief carving six feet (two metres) high. Much of it was originally painted and gilded, which strongly suggests that there must have been a Khmer style of painting of which nothing is known. The subject matter of the carvings is taken principally from the Hindu epics, but there are also many scenes representing Suryavarman's earthly glory. Working in relief only about an inch deep, the sculptors were able to depict an extraordinary complex of scenes of figures in vigorous action, full of complex overlaps to suggest deep space. The solid bodies are created mainly out of groups of convex curves; and everywhere there is the typical regional feeling for decorative spirals. Perhaps the most interesting group of figures are the *apsaras*, carved in relief, either singly or in groups, on the plain walls of the courtyards. These celestial beauties, whom Indian tradition describes as rewarding with their charms the kings, heroes, and saints who attain heaven, are carved with sinuous sensuality; but the most important part of their charm is their elaborate clothing, jewelry, and hairdressing or ornate, towering, jewelled crowns. Apparently, deep, downward-drooping curves standing far out from the body represented the height of Khmer chic. Skirts, stoles, and the long sidelocks of the hair all follow these curves, laid out flat on the ground of the relief. Symbolizing the erotic joys that are essential attributes of heaven, the *apsaras* were natural possessions of the king.

The *apsaras*

In many senses the Wat was the end of the road for Khmer art. The effort demanded of the people in constructing this colossal stone monument, along with its four miles (six kilometres) of stone-lined moat 200 yards (180 metres) wide, appears to have been too great. The irrigation system itself may well have been neglected in favour not only of shifting the building stone—as much in quantity as there is in the Pyramid of Khafre in Egypt—but also of dressing, carving, and ornamenting it. After Suryavarman's death, the Cham, from the neighbouring kingdom of Champa (see below *Vietnam kingdom of Champa*), seized and sacked Angkor for the first time in its history (1177), thus shattering the confidence of the Khmer people in the protective powers of their Hindu deities. When Suryavarman's son, Jayavarman VII, came to the throne he inherited a ravaged kingdom. In 1181 he succeeded in driving out the Cham; he invaded their country and seized their capital, thereby making Champa a province of the Khmer. Then, over 60 years old, he embarked on a series of campaigns that extended the borders of the Khmer Empire further than ever before—into Malaya, Burma, and Annam.

The Bayon

The ruler of this empire naturally believed himself to be the greatest of the Khmers, and he set about demonstrating the truth of his belief by building his own city, Angkor Thom (*c.* 1200), and, at the centre of it, the biggest temple complex of them all—the Bayon (*c.* 1200). Breaking with all previous Khmer traditions, he took as his patron deity not one of the Hindu gods but one of the Buddhist *bodhisattvas*. Although Buddhism had flourished for several centuries in the whole of Indochina, it had not been

adopted by the Khmer as an imperial cult. Now that the Hindu gods had been discredited by defeat, Jayavarman placed himself under the patronage of Mahāyāna Buddhism. The mythology according to which the Bayon was designed was thus another version of the old mythology of the celestial mountain and the divine origin of water. Only the central figure of his mythology, Lokeśvara, Lord of the World, was specifically Buddhist. The colossal masks that look out over the four directions of the world from the towers of the Bayon and from the gates of Angkor Thom are there to demonstrate the compassionate, all-seeing power of Lokeśvara and the king.

When Jayavarman VII set out to create Angkor Thom, he had to raze the fine older work of his predecessors, for the site at Angkor had become choked with nearly four centuries of grandiose temple building. Within Angkor Thom's ten miles (16 kilometres) of moats he constructed huge complexes of building and made his city the focus of a final system of canals and irrigation, with additional lakes.

Unfortunately, the innumerable new shrines that surround Angkor Thom, the towers that crowd the Bayon, and the vast stone terraces faced with relief that surround the royal palace are in general much inferior in execution to the work of the earlier kings. Thus, today Angkor is dominated by the overwhelming presence of Jayavarman's immense but relatively unrefined architecture. The King's ambition was satisfied by size and quantity rather than artistic quality. Because sculptors were obliged to produce such vast quantities of work so fast, their standards deteriorated, and the huge vistas of narrative relief show signs of haste and slipshod workmanship. The real achievement lay with Jayavarman's scholastic architects, who conceived and laid out a complex of mythical imagery in massive architectural symbols. Their stupendous overall plan illustrates the creation of the world, a cosmos spreading outward from the central mountain tower. The two roads leading from the tower are lined with mile-long rows of gigantic deities who are pulling on the body of the serpent *nāga*. According to Hindu legend, the gods use the magical mountain Meru, symbolized by the mountain tower, as a churning stick and the body of the cosmic serpent as a churning rope to churn the world out of the milk of nothingness. Lake-sized fountains represent the healing waters of the Buddhist paradise, and allegories of salvation are realized in carved architecture. Perhaps the most impressive works of art associated with this last period of Angkor are some stone icons, such as the famous "Leper King," in the Angkor Thom complex. Many excellent smaller bronze figures of deities have also been found among the ruins.

Decline of Angkor

13th century to the present. After the death of Jayavarman VII, *c.* 1215, possibly as late as 1219, Angkor declined. The Thai population of Siam gradually pushed the Khmer down toward the Mekong Delta. Theravāda Buddhism became the religion of the people, and the grandiose vision of a cultural unity based on sacred kingship disappeared. In the 15th century, Angkor was retaken from the Thai, and a few buildings were restored by the ancestors of the modern (now abdicated) Cambodian kings. Some of the buildings were used as monasteries, but the city, with its essential irrigation system, had fallen into ruin.

Vietnam kingdom of Champa: c. 2nd to 15th century. The kingdom of Champa existed alongside the Khmer kingdom, sometimes passing under its rule, sometimes maintaining a precarious independence. From the north it was continually subject to the pressure of the advancing Vietnamese, a people racially related to the Burmese and Thai, who were themselves under pressure from the Chinese. The Hinduizing dynasties who ruled Champa from the 6th century were obliged to pay heavy tribute to the Chinese Empire. After 980 they were forced by the Vietnamese to abandon their northern sacred capital, My Son; thereafter, except for a brief return to My Son in the 11th century, their southern capital at Vijaya (Binh Dinh) became their centre. Under such disruptive circumstances, it is perhaps surprising that the Cham succeeded in creating and maintaining a dynastic art of their own. It was, however, always on a relatively modest scale, devoted to a conception of divine kingship similar to but far less ambitious than the Khmer.

The evolution of Cham art falls naturally into two epochs, the first when the capital was in the north, the second when it was removed to the south.

Art of the northern capital: 4th to 11th century. The form of the earliest temple at My Son, built by King Bhadravarman in the late 4th century, is not known. The earliest surviving fragments of art come from the second half of the 7th century, when the king was a descendant of the royal house at Chenla. The remains of the many dynastic temples built in My Son up until 980 follow a common pattern with only minor variations. It is a relatively simple one, with no attempt at the elaborate architecture of space evolved by the Khmer. Each tower shrine is based upon the central rectangular volume of the cell. The faces are marked by central porticoes that are blind on all but the western face, where the entrance door is situated. The blind porticoes seem to have contained figures of deities—perhaps armed guardians standing in a threatening posture. The porticoes are set in a tall, narrow frame of pilasters (columns projecting a third of their width or less from the wall), crowned with horizontally molded capitals that step out upward. They support a tall, double-ogival blind arch, crowned by another stepped in behind it. The arches are based on an Indian pattern and are carved with a design of slowly undulating foliage springing from the mouth of a monster whose head forms the apex of the arch. The faces of the walls are formed of pilasters framing tall recesses. The pilasters are carved with foliate relief, and elaborate recessed and stepped-out horizontal moldings mark their bases. The height of the pilasters and recesses gives a strong vertical accent to the body of the shrine. The principal architrave is carried on stepped-out false capitals to the pilasters. The roof of the tower is composed of three diminishing, compressed stories, each marked by little pavilions on the faces above the main porticoes. Inside the tower is a high space created by a simple corbel vault with its stepped courses of masonry. The chief portico was extended to include a porch, and the whole structure stood upon a plinth whose faces bore molded dwarfed columns (small columns) and recesses.

Pedestal altars

These temples have one distinguishing internal feature: a pedestal altar within the cell, upon which statues were set, sometimes, it seems, in groups. The pedestals themselves are often beautifully adorned with reliefs, and some of the best Cham sculpture appears upon them. The subjects are usually based on Indian imagery of the celestial court. The fact that the pedestal altars carried their sculptures in the space of the cell, away from the wall, meant that the Cham sculptors could think in terms of three-dimensional plasticity as well as relief.

The glory of Cham art is the sculpture of the whole of the first period. Much of what survives consists of lesser figures that formed part of an architectural decor: heads of monsters, for example, which decorated the corners of architraves, and figures of lions, which supported bases and plinths. These figures reflect the heavy ornateness of the Cham decorative style at its most aggressive; and many of them effloresce into the solid, wormlike ornament that is the Cham version of Indo-Khmer foliage carving and carries strong reminiscences of Dong Son work. The remaining fragments of the large icons suggest a double origin for Cham art traditions. On many of the capitals and altar pedestals are series of figures carved in relief in a sensuous style, which is nevertheless strictly conceptualized. This sophisticated work is reminiscent both of late Chenla art (see above *Cambodia and Vietnam*) and of Indonesian decoration, especially during the 11th-century return. Other figures are more coarsely emphatic in style, with the crudely defined cubic volumes and the heavy faces of Melanesian sculpture. It is thus probable that artists trained in the sophisticated Cambodian tradition worked for the Cham kings at one time or another, while Champa's own native craftsmen emulated the work of the foreigners in their own fashion.

Apart from My Son there are one or two other sites in north and central Vietnam where Cham art was made in quantity. The most important of these is Dong Duong, in

Quang Nam. It is a ruined Buddhist monastery complex of the late 9th century, conceived on the most beautifully elaborated plan of structured space in Champa. The architectural detail is distinguished from the My Son work by its greater emphasis upon the plasticity of architectural elements such as angle pilasters and porticoes. The circuit wall was about half a mile (one kilometre) long and once contained many shrines dedicated to Buddhist deities. It is possible that, when this complex of brick courts, halls, and gate pavilions was intact, it may have resembled very closely the contemporary Buddhist monasteries of northeastern India.

Art of the southern capital: 11th to 15th century. After 980, when the northern provinces were taken over by the Vietnamese and the Cham capital established at Binh Dinh in 1069, the kings maintained a gradually diminishing splendour. After the Khmer attack of 1145 they could claim little in the way of royal glory.

Although the Cham kings made a brief return to My Son from 1074 to 1080, most of their artistic effort was spent on shrines at Vijaya (Binh Dinh) and a few other sites in the south. The early 12th-century Silver Towers at Binh Dinh are simplified versions of the older northern towers, with corner pavilions added to the roofing stories and arches of pointed horseshoe shape. Throughout the 13th and early 14th centuries the architecture of successive shrines gradually declined. The plasticity of the old pilasters and architraves was suppressed into simple moldings, and the beauty of the buildings became largely a matter of proportion. By the mid-14th century even the temples erected at Binh Dinh amounted to little more than piles of crudely cut stones articulated only by reminiscences of the classic Cham style.

Decline of shrine architecture

Sculpture shows a parallel decline. One or two reliefs at the Silver Towers do convey a sense of tranquillity and splendour, but an indigenous style of rigid cubical emphasis came progressively to dominate the iconic Hindu figures at southern sites. The curlicued design of earlier figures was gradually converted into a style of massive, scarcely carved blocks that convey, at their best, an impression of barbarous strength but without the refinement of first-class primitive art.

As was the case in Cambodia, this decline in art by the mid-14th century may be attributed to the people's loss of confidence in the concept—and, with it, the imagery—of divine kingship. Theravāda Buddhism, as a popular religion based upon numerous small, local monasteries, adopted probably from the Tai, was spreading all over the region. The northern Vietnamese, who had originally been organized in self-contained kingdoms without any concept of royal divinity, owing an intermittent administrative allegiance only to the distant Chinese emperor, found this ultimately suitable as a state religion after the final eclipse of Confucianism in the 17th century. They did incorporate echoes of older Hindu architecture, however, in details of the flamboyant ornament used on eaves and gables of their wooden monastery buildings.

Vietnam: 2nd–19th century. The great achievement of Vietnamese art, at least during the Le period (15th–18th centuries), seems to have been in architectural planning, incorporating Confucian, Taoist, or Buddhist temples into the landscape environment. The plans themselves include halls for a multitude of images in South Chinese vein and provision for a variety of rituals. There are no intact monuments of early Vietnamese architecture that are unrestored. Numerous fragments exist, however—either isolated stone bases, columns, stairways, and bridges or carved wooden members incorporated into later buildings—all of which are influenced to some degree by Chinese styles.

Tombs of the Chinese type

Tombs of generically Chinese type from the 2nd to 7th century contain bronze furnishings, in many of which, such as lampstands, the influence of the Dong Son style is clearly visible. There are no spirit images so typical of Six Dynasties (3rd–6th centuries) and T'ang (7th–10th centuries) Chinese tombs. The Chua Mot-cot, Hanoi, has vestiges of a stone shrine probably dated 1049. The only old paintings, on rock, at Tuyen Quang, (9th century) represent the Buddha, *bodhisattvas*, and donors. The Van-mieu at Hanoi (built 1070 but frequently restored) contains ritual bronzes in "barbaric" Chinese style.

Perhaps the most interesting early sculptures to survive are the stone fragments from the Van-phuc temple (9th–11th centuries), which are based on Chinese Buddhist imagery but in a style strongly Indianized, perhaps by Cham influence. The most important piece of old work still virtually intact is the portable octagonal wooden stupa kept in the hall of the But-thap, at Bac Ninh, east of Hanoi. It has wooden panels carved in a flamboyant 14th-century Chinese style; part of it bears a representation of the Buddhist paradise of Amitābha. Incorporated in many Buddhist temples of the Le period (15th–18th centuries), as well as in stone terraces, bridges, and gateways, is extremely elaborate carved and coloured woodwork in a style based upon the coiling dragon-and-cloud decoration of Ming (1368–1644) and Ch'ing (1644–1911) China, but with a characteristically Vietnamese exaggeration of weight and curve.

At Tho Ha there was a potters' village, where the glazed ceramic figures used on many types of Chinse temple were manufactured. The remains of many tombs, palaces, bridges, and Confucian and Taoist temples decorated in similar vein are known everywhere.

19th and 20th centuries. The beautiful imperial palace of Hue (final plan before 1810) contained vestiges of older architecture and many works of Sinicized art before its devastation in 1968. It consisted of a series of simple, rectangular, one-story pavilions, laid out among trees inside a group of courts. These buildings and their decoration were southern Chinese in basic conception.

Elsewhere in Vietnam, both religious and secular buildings have been constructed in the 20th century in provincial versions of Chinese styles. There was little demand for the sculptor's art beyond the carving of stereotyped Buddha icons, monsters, and guardians. In modern times southern Vietnam has adopted a decorative style partly derived from the active traditions of Bangkok. Religious sects abound, with hybrid native European and Chinese elements used in their iconic and decorative art. Because of political turmoil, no clear and individual modern Vietnamese artistic tradition has been able to emerge.

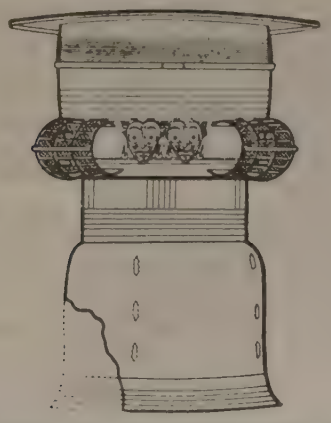
INDONESIA

The islands that at the present day compose Indonesia probably once shared in the complex Neolithic heritage of artistic tradition, which also spread further, into the islands of Melanesia and Micronesia. Beautifully ground Neolithic axes of semiprecious stone are treasured still in some countries. In many parts of Indonesia there are quantities of megalithic monuments—menhirs, dolmens, terraced burial mounds, stone skull troughs, and other objects. Some of these are undoubtedly of Neolithic date, but megaliths continued to be made in much more recent times. One stone sarcophagus in eastern Java, for example, is dated post-9th century. On Nias island, megaliths are still revered, and they are still being erected on Sumba and Flores islands. Thus, in Indonesia especially, different layers of Southeast Asian culture have existed side by side. The most impressive and important collection of megaliths is in the Pasemah region, in south Sumatra, where there are also many large stones roughly carved into the shape of animals, such as the buffalo and elephant, and human figures—some with swords, helmets, and ornaments and some apparently carrying drums.

Megalithic monuments

These drums immediately suggest the drums characteristic of the mainland Southeast Asian Dong Son culture, which flourished *c.* 4th–1st centuries BC (see above *General development of Southeast Asian art*). This culture may well have helped to diffuse throughout the region styles related to Chinese Chou and pre-Han ornamental work. Certainly, the Dong Son influence is clear in many of the ceremonial axes, as well as many of the ornamented bronze drums, that have been found in the islands. The bronzes were cast by a cire perdue process resembling that used in parts of the Asian mainland. The largest and most famous drum is "the Moon of Bali," found on that island near Pedjeng. It has molded flanges, and cast onto its faces is extremely elaborate relief ornament consisting

of stylized masks with ears pierced and lengthened by large earrings. Such drums were probably originally used in ritual—by the rainmaker, perhaps—and they may have been buried with the distinguished dead. No one knows the exact age of these bronzes; "the Moon of Bali," for example, could be anywhere between 1,000 and 2,000 years old. Similar small drums were used quite recently as bride prices; and many of the islands today produce textile designs and ceremonial bronzes that are strikingly reminiscent of Dong Son ornament.



"The Moon of Bali," bronze drum found near Pedjeng, Bali. In the Panataram Sasih temple, Pedjeng, Bali. Height 1.87 m, diameter 1.60 m.

From P. Rawson, *The Art of Southeast Asia*, Thames and Hudson Ltd., London

Central Javanese period: 7th to 13th century. Sometime between the 3rd and 6th centuries AD, Indianized principalities existed in Java. The chieftains who lived in their *kratons* (fortified villages) seem to have derived great inspiration, prestige, and practical assistance from the skills and ideas imported from India. In Sumatra there was the important but so far enigmatic Indianized kingdom of Śrivijaya, which, from its strategic position on the Strait of Malacca, exercised a powerful artistic influence in the whole region. Its great Buddhist centre, Palembang, might have had direct connections with the monasteries of southeastern India; for fine bronze Buddhas and *bodhisattvas* in a style reminiscent of Amarāvatī (2nd century AD) have been found in many regions where the influence of Śrivijaya might have been felt, including Mon Dvaravati (see above *Thailand and Laos*) and distant Celebes. Elsewhere among the islands were Indianized kingdoms still unknown to history.

The Indianized art of Śrivijaya

The local dynasties of the *kratons* competed among themselves for power, and eventually the principal dynasties known to history came to the fore. The earliest major cultural assimilations from India took place probably during the 7th century, when the Hindu Pallava form of southeast Indian script was adopted for inscriptions in west Java. Thereafter, a central Javanese dynasty that worshipped Śiva made the oldest surviving artworks in stone. The last king of this dynasty retreated to east Java in the face of the rising power of another central Javanese dynasty, the Śailendra (AD 775–864.) The Śailendra were followers of Mahāyāna and Tantric forms of Buddhism, although Hinduism, as manifested in the worship of Śiva and Vishnu, was by no means eliminated. This dynasty created far the larger part of the immense wealth of first-class art known today in Java.

In Indonesia, the word *tjandi* refers to any religious structure based on an Indianized shrine with a pyramidal tower. This was the essential form on which virtually all the stone Indianizing architecture of Southeast Asia was originally based. The Javanese, like the Khmer, evolved an elaborate architecture of their own around the basic Indian prototype.

Central Javanese stone architecture did not use structural pillars, nor did its major stone monuments conceptualize hollow space in the way Khmer architecture did. Like Indian stonework, central Javanese stonework is fundamentally conceived as a solid mass, serving as a vehicle for figurative and symbolic sculpture. Its temples are centralized, with enclosures radiating around the central shrine. In eastern Java and Bali, however, the pattern of the shrine was influenced by older traditions and was usually conceived as an enclosure, the walled area of ground be-

ing the sacred element, while the buildings in it were of secondary importance. Old wooden buildings do not survive; but representations of wooden architecture in stone reliefs and the recent architecture of Bali show that eastern Indonesia was influenced by the ancient Southeast Asian tradition of constructing wooden pillared halls with tiered, sloping, and gabled roofs.

Because there are no inscriptions to supply dating points, the exact dates of the earliest Indonesian architectural monuments are not certain. The group of shrines generally believed to be the earliest is situated on the Dijeng Plateau. This is a high volcanic region, about 6,000 feet (2,000 metres) above sea level, where there are sulfur springs and lakes. The whole mountain seems to have been sacred to the Hindu deity Śiva, for all temples on the Dijeng are dedicated to him. There can be little doubt that during the 8th and 9th centuries the Javanese, who traditionally had interpreted the volcanic turbulence of their landscape as a manifestation of divine power, identified this power with the terrifying Śiva. On other Javanese volcanic mountains, also, groups of shrines are dedicated to him.

Hindu *tjandi*s

The temples on the Dijeng are single-cell shrines, roofed with diminishing stories. The exteriors of the temples are relatively plain; only around door frames and window frames are there distinctive passages of central Javanese ornament. Around the niches of Tjandi Puntadewa are perhaps the earliest surviving examples of the characteristic Javanese doorframe: across its lintel is carved a mask of the Indian Kāla monster, which represents time; and down the jambs, as if vomited from his open mouth, run string panels of foliage. The foot of each jamb terminates in an elaborately carved scrollwork cartouche, which is itself a *makara* (water monster) head seen in profile. This *tjandi*, like others on the Dijeng, has a single approach stairway rising between curved balusters. A few stone images of Śiva from these temples have been found. In broad, vigorous forms they express the dangerous power of the god.

Two of the very finest early Javanese sculptures—virtually in the full round—come from yet another Śiva temple, Chandi Banon, near Borobuḍur (see below). One, representing the god Vishnu (no stranger in syncretic Javanese temples of Śiva), has the extremely smooth, faintly amorphous suavity, the absolute convexity, and the lack of definition between planes characteristic of the classical central Javanese sculptural style; while the garment he wears, with its assortment of girdles, is closely reminiscent of late Pallava–early Cōḻa Hindu styles of southeast India. Another icon, sometimes called Agastya but more likely the third deity of the Hindu trinity, Brahmā, represents the god in the form of a bearded Brahmin sage. He has a large and, to Oriental eyes, splendid potbelly. This icon was indigenous to southeast India. The great depth of the side recessions of these figures, although perhaps not so clearly defined as in the great Funan–Chenla style (see above *Cambodia and Vietnam*), gives them a bland massiveness. The lack of movement in the figures and the regularity of the designs, the impassive faces, and the slowness of the lines must have been part of the central Javanese conception of transcendent glory.

The Hindu temples of central Java are conceived simply as shrines to contain icons of deities for worship. The Mahāyāna and especially the Tantric Buddhist *tjandi*s, however, were called upon to do far more. They were designed to express complex metaphysical theories. The challenge this presented to the central Javanese architects was met in a series of splendid monuments, completely original in conception. The culminating work of the series, Borobuḍur, is a highly evolved architectural image, whose subtlety and refinement were never matched, even at Angkor in Cambodia.

Buddhist *tjandi*s

The first work of this Buddhist series is Tjandi Ngawen, near Muntilan. This *tjandi* consists of five shrines facing east, 12 feet (four metres) apart in a row from north to south. Each shrine contained one of the five Buddhas who, according to Tantric Buddhist theory, presides over one of the five major psychological categories under which ultimate reality reveals itself. The shrines themselves are based on but more developed than those used for Hindu deities elsewhere in Java. Roughly square in plan and roofed with diminishing stories, they have pilastered projections on three faces and a portico on the east. Along the architrave are small triangular antefixes and reliefs of Kāla monsters vomiting floral scrolls hood the niches and portals.

The group of five Buddhas is familiar in the art of Tibet, Japan, and northeast India. Among them they compose what is called the *vajra-dhātu*, which means, roughly speaking, "the realm of total reality." According to the old Javanese theology, above this group is another, called the deities of the *garbha-dhātu*. *Garbha* means "womb" or "innermost secret," and its three deities personify the most esoteric realms of Buddhist speculation. At the centre of the group is the image of the single, undivided Buddha nature, which symbolizes the ultimate reality of the entire universe. From his right side emanates the *bodhisattva* Lokeśvara (Lord of the World), who is both compassionate and possessed of all power. From the left emanates the *bodhisattva* Vajrapāṇi, who is the personification of the most secret doctrines and practices of Tantric Buddhism. One of Java's greatest monuments, Tjandi Mendut, is a shrine expressly created to illustrate the combined doctrine of *garbha-dhātu* and *vajra-dhātu*.

Mendut dates from about 800 and is thus, generally speaking, contemporary with Borobuḍur. It is formed as a single large, square chamber, roofed with the usual diminishing stories, and mounted on a high, broad plinth.

Tjandi Mendut

which is approached on its northwestern face by a staircase with recurved balustrades. The exterior is in every way more ornate than that of any shrine so far discussed. In addition to floral diaper (an allover pattern consisting of one or more small repeated units of design connecting with or growing out of one another) and scrolls, there are numerous figures in relief representing male and female deities, the subsidiary principles of the combined doctrine of *garbha-dhātu* and Vajrapāṇi. Cut into the fine ashlar (squared-stone) masonry are many relief panels with scenes from Buddhist literature, each panel self-contained and placed with consummate aesthetic judgment. Some represent mythical ideas, such as the wish-granting tree, others narratives from Buddhist legend.

The principal images were placed inside the cell chamber. Apparently, there were originally seven huge stone icons, but only three remain: the central Buddha, who also represented the ultimate Buddha nature of the *garbha-dhātu,* and his two emanations in the *garbha-dhātu,* Lokeśvara, and Vajrapāṇi. When complete, the interior of Mendut must have been an even more awe-inspiring and spiritually moving place than it is now. The three great statues are seated on elaborate thrones, backed against walls, but the figures are carved virtually in the full round. The inflated, gently inflected forms of the figures give them a majestic presence. The types and carving technique, as well as the monumental scale of the figures, are reminiscent of contemporary work in the cave temples of the western Deccan in India.

On the west–east road from Tjandi Mendut to Borobuḍur stands a small, relatively plain temple called Tjandi Pawon, dedicated to the god of wealth. Pawon was probably a kind of anteroom to Borobuḍur, catering to the more worldly interest of pilgrims. The outside has fine reliefs of female figures, and the roof bears towers of small stupas. On the reliefs are wish-granting trees surrounded by pots of money, and bearded dwarfs over the entrance pour out jewels from sacks.

Borobuḍur

Borobuḍur is one of the most impressive monuments ever created by man. It is both a temple and a complete exposition of doctrine, designed as a whole, and completed as it was designed, with only one major afterthought. It seems to have provided a pattern for Hindu temple mountains at Angkor (see above *Cambodia and Vietnam*), and in its own day it must have been one of the wonders of the Asian world. Built about 800, it probably fell into neglect by about 1000 and was overgrown. It was excavated and restored by the Dutch between 1907 and 1911. It now appears as a large, square plinth (the processional path) upon which stand five terraces gradually diminishing in size. The plans of the squares are stepped out twice to a central projection. Above the fifth terrace stands a series of three diminishing circular terraces carrying small stupas, crowned at the centre of the summit by a large, circular, bell-shaped stupa. Running up the centre of each face is a long staircase; all four are given equal importance. There are no internal cell shrines, and the terraces are solid; Borobuḍur is thus a Buddhist stupa in the Indian sense. Each of the square terraces is enclosed in a high wall with pavilions and niches along the whole perimeter, which prevents the visitor on one level from seeing into any of the other levels. All of these terraces are lined with relief sculptures, and the niches contain Buddha figures. The top three circular terraces are open and unwalled, and the 72 lesser, bell-shaped stupas they support are of open stone latticework; inside each was a huge stone Buddha figure. The convex contour of the whole monument is steepest near the ground, flattening as it reaches the summit. The bottom plinth, the processional path, was the major afterthought. It consists of a massive heap of stone pressed up against the original bottom story of the designed structure, so that it obscures an entire series of reliefs—a few of which have been uncovered in modern

Sculpture at Borobuḍur.

times. It was probably added to hold together the bottom story, which began to spread under the pressure of the immense weight of earth and stone accumulated above.

Symbolism of Borobuḍur

The whole building symbolizes a Buddhist transition from the lowest manifestations of reality at the base, through a series of regions representing psychological states, toward the ultimate condition of spiritual enlightenment at the summit. The unity of the monument effectively proclaims the unity of the cosmos permeated by the light of truth. The visitor was meant to be transformed as he climbed through the levels of Borobuḍur, encountering illustrations of progressively more profound doctrines the nearer he came to the summit. The topmost terrace, whose main stupa contained an unfinished image of Buddha that was hidden from the spectator's view, symbolized the indefinable ultimate spiritual state. The 72 openwork stupas on the circular terraces, with their barely visible internal Buddhas, symbolize incomplete states of enlightenment on the borders of manifestation. The usual way for a pilgrim to pay reverence to a Buddhist stupa is to walk around it, keeping it on his right hand. The vast series of reliefs about three feet (one metre) high on the exterior walls of the terraces would thus be read by the visitor in series from right to left. Between the reliefs are decorative scroll panels, and a hundred monster-head waterspouts carry off the tropical rainwater. The gates on the stairways between terraces are of the standard Indonesian type, with the face of the Kāla monster at the apex, vomiting his scrolls.

The reliefs of the lowest level illustrate scenes that show the causal workings of good and bad deeds through successive reincarnations. They show, for example, how those who hunt, kill, and cook living creatures such as tortoises and fish are themselves cooked in hells or die as children in their next life. They show how foolish people waste their time at entertainments. From these scenes of everyday life, one moves to the terraces above, where the subject matter becomes more profound and metaphysical. It illustrates important Mahāyāna texts dealing with the self-discovery and education of the *bodhisattva,* conceived as being possessed by compassion for and devoted wholly to the salvation of all creatures. The reliefs on the uppermost terraces gradually become more static. The sensuous roundness of the forms of the figures is not abated; but, in the design, great emphasis is laid upon horizontals and verticals and upon static, formal enclosures of repeated figures and gestures. At the summit all movement disappears, and the design is entirely subordinated to the circle enclosing the stupa.

The iconography of Borobuḍur suggests that the legend of the royal *bodhisattva* recounted in many of the reliefs was meant to "authenticate" some king or dynasty. Yet it hardly seems possible that Borobuḍur was the focus of a specific royal cult, as there is no provision at all for the performance of royal ritual. It must have been, then, in some sense a monument for the whole people, the focus for their religion and life, and a perpetual reminder of the doctrines of their religion.

A considerable number of bronzes, some small, some large, have been found in Indonesia in a style close to that of the sculptures of Borobuḍur and Mendut. One fine, large standing image comes from Kotabangun in Borneo; but some come from Java. Many small cult images of the Buddha and Buddhist deities exist. Some are close in type to the early Pāla images of Indian Bihār, the homeland of Buddhism, with which the Javanese must have maintained close touch. A few small but extremely fine gold figurines of undoubted Javanese workmanship have also turned up. For all their small size they must rate as first-class works of art. As well as images there are many beautiful bronze ceremonial objects, such as lamps, trays, and bells. These objects are decorated with the same kinds of ornament, although on a miniature scale, as the architectural monuments: scrolled leaves, swags, and bands of jewels.

Post-Borobuḍur *tjandi*s illustrate the Buddhist doctrine in different ways. Kalasan, for example, built in the second half of the 8th century, was a large, square shrine on a plinth, with projecting porticoes at the centre of each face. The roof was surmounted by a high circular stupa mounted on an octagonal drum, the faces of which bear reliefs of divinities. Topping each portico was a group of five small stupas, and another large stupa stood at each disengaged corner of the main shrine. The moldings were restrained and elegantly profiled. Each section of the exterior wall contains a niche meant for a figure sculpture. The decorative scroll carving is especially fine.

Another shrine from this period, Tjandi Sewu, consisted of a large cruciform shrine surrounded by smaller temples, only one of which has been restored. All of the temples seem to have had roofs in the form of tiered stupas, compressing the overall Borobuḍur scheme into the scope of a storied shrine tower. From Tjandi Plaosan came many beautiful sculptures, donor figures, and iconic images of *bodhisattva*s.

Tjandi Sari

Perhaps the most interesting of the post-Borobuḍur Buddhist shrines of the 9th century is Tjandi Sari. It is an outstanding architectural invention. From the outside it appears as a large, rectangular, three-storied block, with the main entrance piercing the centre of one of the longer sides. The third story stands above a substantial architrave with horizontal moldings and antefixes. Two windows on each short side, three on each long, open into each story, though at the rear they are blind. The windows are crowned by large antefix-like cartouches of ornamental carving based on curvilinear pavilions hung with strings of gems. The uppermost windows are hooded with the Kāla-monster motif. The roof bears rows of small stupas, and perhaps there was once a large central stupa. Inside, Tjandi Sari contains a processional corridor around three

interior shrines that were possibly intended for images of the *garbha-dhātu* deities, as at Tjandi Mendut.

The last great monument of the central Javanese period, Lara Jonggrang at Prambanan, is indeed a colossal work, rivalling Borobuḍur. It was probably built soon after 900. Not Buddhist but Hindu, the shrine represents the cosmic mountain. There were originally 232 temples incorporated into the design. The plan was centred on a square court with four gates containing the eight principal temples. Facing east, the central and largest temple, some 120 feet (40 metres) high, was devoted to the image of Śiva. To the north and south it is flanked by slightly smaller temples devoted to the two other members of the Hindu trinity, Vishnu and Brahmā. The smaller shrines contained many subsidiary images. The whole complex was enclosed, far off-centre, in an extremely large walled courtyard.

Although these are Hindu buildings, their high-terraced shrine roofs bear tiers of elongated and gadrooned stupas. The reliefs on these structures are especially beautiful. One series, representing the guardians of the directions, integrates the ornamental motifs with the plastic forms of the bodies in a most original way. The balustrades and inset panels abound with lively reliefs portraying various deities or scenes taken from the great Hindu classics, especially the *Rāmāyaṇa*.

East Javanese period: 927–16th century. During the east Javanese period a very large number of monuments were produced at the eastern end of the island (after 1222) and in Bali (after *c.* 1050). Few single structures, however, are as impressive and as comprehensively planned as are the monuments of Borobuḍur or Lara Jonggrang.

Around the strange natural mountain with tiered peaks cut and built in stone called Mount Penanggungan there are 81 structures (10th-century) of different kinds (now mostly in ruins). Prominent among these structures are bathing places. This mountain was identified by the people with the sacred Mount Meru, and its natural springs were believed to have a magical healing power and a mystical purifying capacity. Another such bathing place is Belahan (11th century). Made of brick, it, too, has extensive ruined temples. Belahan is supposed to have been the burial place of King Airlangga, who probably died about 1049. One of the greatest east Javanese icons formed the central figure against the back wall of the tank. Carved of red tufa (a porous rock), it shows the god Vishnu seated at peace on the back of his violently dramatic bird-vehicle, Garuḍa. It is said that the image represents the King himself in divine guise. Beside this image was a sculpture of a type associated with many of these sacred bathing sites. It is a relief of a four-armed goddess of abundance, her two lower hands holding jars pierced with holes, her two upper hands squeezing her breasts, which are also pierced; through the holes the sacred water flowed into the basin. There are many variants of this idea at the springs of Mount Penanggungan. On Bali the same kind of fountain sculpture appears at the Goa Gadjah, at Bedulu, in a spring-fed tank below a cave.

Four-armed goddess of abundance

In both Java and Bali there are many rock-face relief carvings from this period (there are no secure dates). Some represent legendary scenes; others represent *tjandis*; the shallow chambers of others are thought to be royal tombs.

The structure that gives the best ideas of what the typical east Javanese shrine of the mid-13th century was like is Tjandi Kidal. The nucleus of the building is a square cell, with slightly projecting porticoes each hooded by an enormous Kāla-monster head. But the cell itself is dwarfed both by the massive molded plinth upon which it stands and by the huge tower with which it is surmounted. The tower stands above an architrave stepped far out on tiered moldings. It is no longer composed of diminishing stories, as earlier towers were, but is conceived as a massive pyramidal obelisk made up of double bands of ornament spaced by stumpy pilasters and bands of recessed panels. The architectural projections and moldings distinguish Tjandi Kidal from earlier Javanese architecture, with its plain wall surfaces.

Many masterpieces of sculpture belong to the east Javanese period. Among them are some superb icons of Śiva and of a goddess of Buddhist wisdom from Singhasāri and a splendidly "primitivist" image of the elephant-headed god of wealth from Bara, Blitar.

From the late 13th century onward a whole series of *tjandis* was created in eastern Java. As time went on the *tjandis* lost their monumental scale and became simply

shrines within a series of courtyards on a pre-Indian pattern. From Tjandi Djago through Tjandi Panataran at Blitar (14th century) and Tjandi Surawana it is possible to trace the line of descent of the modern Balinese temple enclosures.

Influence of shadow puppets on relief figures

By the end of the 14th century, the figures in the relief sculpture at these shrines had come more and more to resemble the shadow puppets of the popular *wayang* drama. They adopt the stiff profile stance that presents both shoulders, while the trees and houses resemble the stereotype silhouette leather and wood cutouts used as properties in the shadow plays. The art of carving in the near-full round, however, did not follow the same course of evolution as the reliefs. Such work did become softer and more delicate in style, with accretions of broad floral forms, but well into the 15th century the icons retain something of the strength of older sculptural conceptions. Another plastic tradition that seems to have escaped domination by the *wayang* formula resulted in the production of beautiful small terra-cotta figures as part of the revetment (stone facing sustaining the embankment) of the east Javanese capital city of Majapahit. Like the reliefs, the many small excavated bronzes of Hindu scenes are under the *wayang* influence, three-dimensional though they may be. Curlicues proliferate, and the plasticity of bodies is virtually ignored.

16th century to the present. When Islām arrived in Indonesia, it used the repertoire of traditional ornament for its mosques and tombs; but, in conformity to a puritan Muslim custom, the representation of living creatures was excluded on religious buildings. The gates of the 16th-century mosque at Sendangduwur, Badjanegara, show a splendid example of this adaptation. The wings of the old Hindu Garuḍa, a colossal bird-vehicle of the high god Vishnu, frame the gate; the body and head are suppressed. Above the lintel are abstract tree-clad mountain forms recalling the imagery of the cosmic Meru; and legendary snakes hood the jambs. The 16th-century mosque at Kudus even has a gate based on the split-*tjandi* pattern used in Bali (see below). Tombs such as that of Ratu Ibu at Airmata, on the island of Madura, add to their simple volumes elaborate but abstract variants of the scroll-filled antefixes of older architecture and of the petal-shaped aureoles of the larger east Javanese icons. In Sumatra the Muslim rulers encouraged a revival of the pre-Indian ancestor cult, along with its ancient and characteristic arts.

Bali. The rajas of eastern Java finally retreated before the Muslim invaders during the 16th century and departed to the island of Bali, where they remained. The old Javanese Indianized culture they brought with them survived and combined with animist folk elements. In Bali today that culture has bred a widespread popular art. There are now many hundreds of temples in Bali of varying age. Each family group has its own temple, dedicated to the ancestors; each village, too, has its temple, in which special attention is paid to a rich fertility goddess identified with the ancient Indian goddess of bounty, Śrī. Special temples dedicated to the goddess of death stand near the cremation ground. There are numerous major temples—many associated with volcanic peaks—dedicated to different deities and spirits; they range in size and importance from Besakih on Mount Agung (where a megalith is incorporated as a phallic Śiva-emblem) to Panataram Sasih of Pedjeng (where the bronze drum called "the Moon of Bali" is preserved).

Balinese temples

Balinese temples are conceived as multiple courts raised on terraces. The tall stone or brick and plaster gates are shaped like a *tjandi*-tower split down the centre; they are usually encrusted with ornament based upon deep multiple curlicues interspersed with simplified, two-dimensional relief figure sculpture. Fantastic three-dimensional guardians sometimes stand at the foot of the access staircase. Beyond the gates are one or two courts within which various ceremonies (including sacrifices and cockfights) may take place. The rearmost court backs onto the mountain, whence spirits descend temporarily when invoked. The court has no icons; at most, there is a seat for invisible deities. The structures in the court, mostly of wood and thatch, may be of many stories. (Such structures are called *merus*.) Sometimes the treasuries are ornamented with carving; and a few older stone *meru* towers in local shrines are carved with mythological figures.

Temple ceremonials, especially the cremation of distinguished people, evoked elaborate ritual art objects in precious metals, as well as in wood or fabric. All were characterized by exuberant and repetitive curvilinear floral ornament and by figures based on Indian legend, especially the *Rāmāyaṇa* and parts of the *Mahābhārata*. In the villages today, music, dance, sculpture, and painting are focussed on the shrines and are practiced with an intensity unknown elsewhere in the world. Art is woven intimately into the life of the people. The masks carved of wood for the dances are specially refined, sometimes ornate versions of the masks used in the animist rituals of other Southeast Asian peoples. In the 20th century there are numerous village sculptors and painters, who sell to tourists work based upon the old ceremonial arts. During the 1930s an outside impetus to develop their traditional legendary imagery in Western formats came from a German painter, Walter Spies, who lived on Bali. A landscape tradition was evolved, and the painters have been able to communicate something of the extravagant visual charm of their island, giving glimpses of luminous village and mountain landscape. The style of both sculptors and painters, however, is based upon gently undulating curves and is often highly ornamental, with repeated patterns. A repertoire of posture and gesture has been abstracted from the *wayang*. The work thus tends to prettiness rather than vigour; the sculptors create no truly intelligible volumes, and the painters fill their surfaces with naïvely structured shapes.

Java: 20th century. A conscious revival of traditional art has been attempted in the 20th century, especially in Java, the main territory of modern Indonesia. There has been government support for the resuscitation of old crafts—silverwork, for example. A number of artists have adapted Westernized figure drawing to their own decorative compositions. The best known painter of Indonesia is the Javanese Affandi. He has used oil paint to execute pictures of Indonesian subjects in a vividly coloured Expressionist impasto (thick application of pigment to the canvas). This European brushwork technique, however, contains a strong element of the sinuosity of Javanese tradition. As yet, Affandi is the only artist from Southeast Asia to have attained a personal worldwide reputation.

Indonesian painting

THE PHILIPPINES

The population of this island group contains a number of different ethnic strata, the oldest of which shares in the general folk culture and its associated folk arts of the islands of Southeast Asia (see above *Indonesia*), with an emphasis on geometric simplification. An element in the Tagalog (a people of central Luzon) is perhaps descended from the oldest level of immigrants with a Paleolithic background. The Moro are Muslims, converted to Islām during the 15th and 16th centuries. Today they produce a decorative art in which old Muslim geometric motifs are combined with strong Chinese decorative influences (from Sung times, Chinese ceramics and textiles were imported). The decoration is applied primarily to textiles, weapons, and containers to hold the betel nuts that are chewed throughout Southeast Asia.

The most important departure in Philippine art was the result of the Spanish conquest of 1571. Thereafter, the bishopric of Manila and all of Luzon became the focus for an elaborate development of Spanish colonial art, primarily devoted to the construction and decoration of Roman Catholic churches in the current flamboyant, highly ornate, and colourful colonial style. There is good colonial architecture in other islands, including Bohol and Cebu. A large quantity of religious sculpture of the canonical Christian subjects was imported from Mexico and from Spain itself. Sculptors and missionary painters also immigrated, and a powerful local school developed under the direct influence of the 17th-century Spanish artists Murillo and Alonso Cano. Local arts were encouraged in 1785 by the remission of taxes for religious artists. Because of the close colonial ties, the stylistic developments corresponded

Influence of Spain upon Philippine art

Bruce Coleman

substantially with those elsewhere in the Spanish Empire, and European prints served as models for local artists. Of the major early churches for which this sculpture and painting was executed, only San Agustin (1599–1614), in Manila, still stands; it was designed by Fray Antonio de Herrera, son or nephew of the great Spanish architect Juan de Herrera. During the 19th century the neo-Gothic style was imported, mainly through the Philippine architect Felipe Roxas, who had travelled in Europe and England. San Sebastian in Manila is a notable example of this style. The Spaniard Hervas, Manila's municipal architect from 1887 to 1893, favoured neo-Byzantine forms; *e.g.,* Manila Cathedral (1878–79).

It was only in the later 19th century that any secular art flourished at all. Schools of fine art modelled on the European schools were set up between 1815 and 1820, and a number of painters began to work in versions of European academic styles, painting landscapes, portraits, and classical subjects. The best known among them are Juan Luna, Felix Resurrección Hidalgo, Antonio Malantic, and the genre painter Fabian de la Rosa. After the transfer of rule to the United States in 1898, industrialization began in earnest; the methods of the art schools were adapted, as in Europe, to the needs of modern commercial society.

Modern Philippine architects

In the 1930s a substantial modern experimental school of Philippine architects began the remodelling of the industrial environment in terms of 20th-century architectural and design conceptions. Prominent names are Pablo Antonio, Carlos Arguelles, and Cesar Concio. Beginning in the 1930s but especially after World War II, artists in Manila adopted the Abstract and Expressionist styles current in the United States. After the devastation wrought by that war, Manila and other cities and towns were rebuilt, virtually anew, in local variants of the international business style.

FOLK ARTS

The arts of many regions in Southeast Asia remained either untouched or only slightly influenced by the Indianized arts of other regions. Such influence is found especially in regions where the gold trade flourished. In Sarawak (Bonkisam), for example, the remains of buildings similar to late Tantric east Javanese *tjandis* have been discovered. Among a few people (*e.g.,* the Meo of highland Vietnam), vestiges of Indian erotic temple imagery have been adapted to local fertility ceremonies, and most of the religious ideas of the region show at least faint traces of Indian influence.

Save for the megaliths and Dong Son bronzes, most of the known folk-art objects are relatively recent, although their inspiration and types belong to traditions far older and geographically more far-reaching than the Indianized traditions.

The two main non-Indian art styles in the whole region have been provisionally named the "monumental" and the "ornamental–fanciful." They coexist virtually everywhere, though they probably represent two evolutionary phases. The principal manifestations of the monumental style are the megalithic monuments, although there is great variety among the megalithic customs of the many different populations in Sumatra, Laos, Indonesia, Borneo, and the Philippines. The influence of the ornamental–fanciful style, which is characterized especially by the scrolled spiral, insinuates itself even into many of the decorative arts, particularly in the curvilinear and flamboyant inflection given to ornamental motives in the major Indianizing styles.

The squatting ancestor figure

The link between the two styles is probably the ubiquitous squatting ancestor figure, cocked knees supporting elbows, carved in soft wood or woven in cane or fibre. These figures may be either male or female. Under special social circumstances in recent times, very large wooden versions of the figure have been used as substitutes for more conventional, standing megalithic ancestral monuments (Sumatra and Sabah). The custom is probably an old one. There can be little doubt, for example, that the Theravāda Buddhist images of Burma, Thailand, and Laos were accepted as special modifications of the ancestor image. The transition from revering numinous ancestor images whose identity had been forgotten to worshipping an Indianizing icon was easy for the tribal populations.

The complex significance of the original squatting ancestor figure enabled it to be used in a variety of contexts. It might have combined associations of the fetus, the fetal burial position, and female birth and intercourse positions, as well as a ceremonial posture assumed by the living. It came to be used primarily in wooden sculpture on all scales, but also in woven textiles (*e.g.,* Iban), to represent the continuing power informing human existence, both in the purely ancestral sense of family continuity and identity and in the sense of the fertility of the land. Its earliest recorded appearance may be on Chinese Yang-shao painted pottery (*c.* 2000 BC); but it appears in essentially the same form over a range of territory including Sumatra, Nias and Sunda islands, Java, Borneo, New Guinea, Taiwan, the Philippines, and out into northern Australia and Melanesia. It may be used purely as an ancestral image in a family shrine house or as a motif added to any one of a variety of implements to potentiate them; for example, large bowls (Sumatra), kris or sword handles (Java, Sumatra, Borneo), spoons (Timor, the Philippines), musical instruments (Borneo), and magicians' staves (Borneo).

The treatment of such figures may be invested with more or less of the characteristics of the ornamental–fanciful style, in those regions where this style prevails (*e.g.,* Batak, Dayak). There are also special versions of the squatting figure that seem to belong especially to important magical crafts, such as the Javanese kris handle, on which miniature carvings can give an extraordinarily monumental effect. Sumatran Dayak hereditary magical staves may be carved with a "tower" or "tree" of such ancestor figures. On Nias, for example, along with the squatting figure, a standing figure in the bent-knee posture common in Polynesia also appears as a variant. In the Philippines similar variants are sometimes interpreted as vestiges from a remote Indian mythology, adopted probably for the sake of their cultural prestige. In southern Borneo the figure appears carved in the full round and as a pattern for woven textiles; it often has a protruding tongue and, sometimes, antlers—a combined motif known in the Ch'ang-sha art of southern China (*c.* 300 BC). Antlers also appear on certain Sumatran knifehilt figures. A variety of designs, some of them "abstract," are based on this figure. Among the Jarai of Vietnam, for example, a pattern of lozenges represents an abstraction from a group of these figures. Especially in the textiles of Sumba and other Indonesian islands, similar patterns, often referred to as decorated triangles,

represent the same phenomenon. When, as in textiles, the anthropomorphic reference of the abstract pattern is lost, the male genitals may remain to assert the ancestor significance.

Cult of the skull

The association between the squatting figure and the widely practiced cult of the skull is manifested in the combined cult of ancestors, headhunting, and head worship. Among the Wa of Upper Burma, for example, the squatting figure in a lozenge abstraction decorates the chests in which the severed heads of enemies are stored. Virtually everywhere among the early farmers of Southeast Asia, such heads were regarded as repositories of great spiritual power. The cult of the skull has produced a version of the squatting figure that is commonly known by the Indonesian word *korvar;* it is a figure with an ancestral skull in place of a carved head. Such figures are especially common in the more easterly island cultures. The ghostly power of the deceased ancestor can thus become present and available to his descendants—to give oracular advice, for example. A related idea is incorporated in the masks used in a wide variety of rituals and dance-dramas throughout Southeast Asia; for example, among the Batak of Sumatra and the Dayak of Borneo, where especially fine examples are made. There can be little doubt that the same idea (blended with imagery from the imported Hindu epics) underlies the range of elaborate masks that were once used in the Javanese and now can be seen in the Balinese *wayang* dances. It is possible that the flamboyant flame skull protuberances and winglike flanges ornamenting the head in so much of the Buddhist art produced in Burma and Thailand reflect a persistent but submerged interest in the cult of the skull.

Another major motif is the snake, which (even in areas where direct Indianizing influence was not strong) is frequently combined with imagery derived from the cult of the powerful, magical Hindu *nāga;* often many-headed, this serpent is the patron and guardian of water and treasure, both material and spiritual. The snake motif has also been blended with images of the Chinese dragon, going back perhaps to Chinese Han ornamental designs. Outstanding examples are found on the elaborate relief-carved doors of Sumatran Batak houses; "flying" roof finials in many parts of Indonesia; and in much Borneo Dayak ornament, from tattoos to carved bamboos and bronze body ornaments. The snake is the magico-mythical creature that gives both its bodily shape (either straight or undulant) and its metaphysical power to the kris. Distributed from Malacca to Celebes, these swords (the earliest known dated 1342) reached their high point of artistic development in Java. A variety of other motifs originating on the mainland of Asia is found in many of the surviving folk arts of Indonesia. Among them are the "man in the embrace of an animal" (Dayak kris handles) and animals "stacked" one above the other (Timor, Indonesia).

The ornamental–fantastic style. The styles in which these variations on basic motifs are carried out vary principally according to the preponderance of the sinuous curves and spirals of the ornamental–fantastic style. This style serves as the basis for decoration and as a method of artistic phrasing. It may have made its way into Southeast Asia as late as the 1st millennium BC, being formally related to the spirals used in Chinese Neolithic, Shang, and Chou bronze art. (It should, perhaps, be mentioned that Chinese art, certainly until well into the Christian Era, was itself far more "tribal" than later Chinese tradition recognizes.) Probably connoting spirituality, the spiral imagery appears in Southeast Asian magical art at all levels, from the textiles of Java and the incised bamboo implements or carved doors of Dayak Borneo to the ornament on the costumes of sculptured dancers or deities at every major city site. Given a fiery upward inflection, it appears in the finials on major Indianized stone architecture and on the carved wooden gables of Burmese and Thai Buddhist halls. There is not always complete stylistic consistency within any one cultural group. For example, the fantastic snake-dragon creatures carved in deep relief on the housedoors of the Batak may be extravagantly sinuous, with many spirals, while their figure sculpture adheres to the sterner plastic idiom, virtually without any

Use of curves and spirals

linear sinuosity. Among the Dayak of Borneo the fantastic style may be confined entirely to surface ornament. On Indonesian islands, ancestral figures may be relatively static and foursquare, while the decorative carving and textiles may display considerable linear fantasy. A special version of the ornamental–fantastic style characterizes the surviving Indianized arts of Bali and Java, intruding even into sculptural inventions derived from strongly three-dimensional medieval Indianizing patterns. Thus, the decoration on the *wayang* cutout leather puppets, with its somewhat stereotyped curlicues, has proliferated at the expense of the three-dimensional sense (see above *Indonesia*). Balinese *wayang* masks may be carved entirely out of curling surfaces and completed in paint with sinuous eyebrows and moustaches. In many parts of Southeast Asia, including Thailand, Vietnam, Burma, Sumatra, and Indonesia, designs originally based upon Indian flowering-scroll patterns can be found in architecture, textiles, theatre costumes, musical instruments, and wooden utensils, all efflorescing with extravagant curling ornament. It is unfortunately true that only in a few of its most serious manifestations does this kind of ornament display substantial artistic invention, with carefully varied, asymmetrical, complementary, and counterchanged curves. Usually, it degenerates into repetitive space filling, without variety or formal meaning.

Textiles. Perhaps the types of folk art best known in the West are the textiles, especially batik and *ikat*. Both names refer to techniques practiced by different groups of people, who must have learned it from each other. Essentially Javanese but known in other islands, batik may have resulted from the imitation with dyes of South Indian painted cloths, probably before 1700. The essence of the technique is that melted wax is poured from a small metal kettle onto areas of a plain cotton cloth, which is then dyed, only the unwaxed parts taking the colour. The process can be repeated with several different colours. The oldest basic colours are indigo and brown; red and yellow were used later. The possible patterns range from lozenges and circlets through a large repertoire of cursive animal and plant forms. The batik technique can produce sumptuous and complex designs that not even the most elaborate weaving techniques can duplicate. It was encouraged by the Muslim rulers as a major element of social expression in garments and hangings.

Batik and *ikat*

Ikat is known among the Batak, in Cambodia, and especially among the dispersed Dayak people. It, too, probably originated in India. The extraordinarily difficult *ikat* textiles (woven cotton and occasionally silk, especially in Cambodia) are made primarily for use in important ceremonials and were regarded by their makers as major works of art. Before being woven, the thread is tightly tied at carefully calculated points in the hank (coiled or looped bundle); this is then dyed, the tied parts not taking up dye. The process may be repeated for different colours. As a consequence of the predyeing, designs appear as the thread is woven. In most *ikat* only the warp (the series

of yarns extended lengthwise in the loom and crossed by the weft) is so treated; but in southern Sumatra a tie-dyed floating weft is added to the plain weft. Naturally, *ikat* designs tend to be static and more or less rectilinear. In the finest *ikat*, however, birds and animals, spirits and houses, and, in Cambodia, a vestigial iconography of royal Buddhism may be formalized into extremely beautiful banded compositions. (P.S.R.)

BIBLIOGRAPHY. REGINALD LE MAY, *The Culture of Southeast Asia* (1954), deals with the art and architecture of Southeast Asian peoples. GEORGE COEDES, *Les États hindouisés d'Indochine et d'Indonésie*, new ed. (1964; Eng. trans., *The Indianized States of Southeast Asia*, 1968) and *Les Peuples de la péninsule indochinoise* (1962; Eng. trans., *The Making of Southeast Asia*, 1966), are standard works.

Literature: (*Burma*): MAUNG HTIN AUNG, *A History of Burma* (1967), contains a general survey of Burmese literature. The same author's *Burmese Folk-Tales* (1948), *Burmese Law Tales* (1962), *Burmese Monk's Tales* (1966); and MAUNG MYINT THEIN, *Burmese Folk-Songs* (1970), provide a good survey of Burmese oral literature. Dramatic literature is treated in MAUNG HTIN AUNG, *Burmese Drama* (1937). (*Thailand*): P. SCHWEISGUTH, *Étude sur la littérature siamoise* (1951), is the standard work on Thai literature. The *Journal of the Siam Society* (various issues) contains studies on Thai literature. (1961); and OLIVER RICE and ABDULLAH MAJID (eds.), *Modern Malay Verse, 1946–61* (1963), are important works to consult. (*Indonesia*): T.G.T. PIGEAUD, *Java in the 14th Century*, 5 vol. (1960–63), is a special study of Javanese literature in the Majapahit period. See also A. TEEUW, *Modern Indonesian Literature* (1967). TAKDIR ALISJAHBANA, *Indonesia in the Modern World* (1961), contains good accounts of modern Indonesian literature against the political, cultural, social, and historical background.

Music: WILLIAM P. MALM, *Music Cultures of the Pacific, the Near East, and Asia*, ch. 2 and 5 (1967), discusses the music of the Southeast Asian region; LAWRENCE PICKEN, "The Music of Far Eastern Asia and Other Countries," in *The New Oxford History of Music*, vol. 1, *Ancient and Oriental Music*, pp. 83–194 (1957), discusses intercultural and musical relationships between Far Eastern and Southeast Asian countries. See also D.R. WIDDESS and R.F. WOLPERT (eds.), *Music and Tradition* (1981), essays on Asian music. (*Burma*): U KHIN ZAW, "Burmese Music: A Preliminary Inquiry," *Journal of the Burma Research Society*, pp. 387–466 (December 1940), appends several pages of music notations to a discussion of music history and the structure of Burmese scales. (*Cambodia and Laos*): ALAIN DANIELOU, "La Musique du Cambodge et du Laos" (1957), is a brochure that discusses with the help of illustrations traditional musical instruments of both countries. (*Indonesia*): JAAP KUNST, *Music in Java*, 2 vol. (1949), an important work with a comprehensive bibliography including works of many Dutch scholars, treats matters regarding history, vocal and instrumental music, structure, notation, and tonal systems of the East-Central and the West-Javanese gamelan; MANTLE HOOD, *The Nuclear Theme As a Determinant of Patet in Javanese Music* (1954), modal structure of patet is analyzed according to basic elements in themes of several gamelan pieces of music; COLIN MCPHEE, *Music in Bali* (1966), gives detailed descriptions and specific musical examples of repertoire played in many gamelan ensembles; WALTER KAUDERN, "Musical Instruments in Celebes," in *Ethnological Studies in Celebes*, vol. 3 (1927), a detailed study with a long list of names of musical instruments, 130 figures, and 19 maps showing the geographical distribution of musical instruments; JAAP KUNST, *Music in Nias* (1939), describes both vocal and instrumental music, classifies musical instruments (Hornbostel-Sachs divisions), and illustrates their distribution in 7 maps; *Music in Flores* (1942), lists in a table the native names of 54 instruments of the five divisions of the archipelago; CHARLES S. MYERS, "A Study of Sarawak Music," *Sammelbände der Internationalen Musikgesellschaft*, 15:296–308 (1913–14), 13 gongs from different cultural groups and music of some instruments are analyzed with the help of musical examples; HENRY L. ROTH, *The Natives of Sarawak and British North Borneo*, 2 vol. (1896)—vol. 1, ch. 9 deals with feasts, festivals and dancing, while vol. 2, ch. 26 discusses music in general; EDWIN H. GOMES, *Seventeen Years Among the Sea Dyaks of Borneo* (1911), terms for songs and names of musical instruments that the author cites are still known in Sarawak; IVOR EVANS, *Among Primitive Peoples in Borneo*, ch. 14 (1922), devoted exclusively to a discussion of musical instruments, music, and dancing; JAAP KUNST, *Music in New Guinea* (Eng. trans. 1967), comprises three works first published in 1931 and 1950 that treat of vocal and instrumental music of the Papua in the north and the central range of mountains, of songs in the north and the West, and of music in the West Central range, Southwest, North and West coasts (many musical examples and a distribution map of musical instruments). (*The Philippines*): JOSE MACEDA, "The Music of the Magindanao in the Philippines," (1963, Ann Arbor University Microfilms), discusses instrumental and vocal music of the whole culture with copious musical examples and two long-playing records available at Folkways Records, New York; and "Drone and Melody in Philippine Musical Instruments," paper read at an International Conference on Traditional Drama and Music of Southeast Asia, Kuala Lumpur, August 27–31 (1969), discusses age, spread, and variety of combinations of drone and melody as a root structure. (*Thailand*): DAVID MORTON, "The Traditional Instrumental Music of Thailand," (1964, Ann Arbor University Microfilms), a study that covers both the historical and structural aspects of Thai music. (*Vietnam*): TRAN-VAN-KHE, *La Musique Vietnamienne traditionelle* (1962), detailed and important information about history, musical instruments, and musical theory (references abound with criticism of some works); and *Vietnam* (1967), a clear and concise presentation, containing valuable new historical material.

Dance and theatre: JAMES R. BRANDON, *Theatre in Southeast Asia* (1967), a general survey of major theatre forms, incorporating firsthand observation. (*Burma*): MAUNG HTIN AUNG, *Burmese Drama* (1937), a detailed history and translations of plays, four complete and eight in excerpts; KENNETH SEIN and J.A. WITHEY, *The Great Po Sein* (1965), a lively chronicle of the Burmese stage of the last century, cast in the first person narrative, by a famous contemporary actor; U POK NI, *Konmara Pya Zat* (1952), a complete English translation of a 19th-century play with interpretive notes. (*Cambodia*): JACQUES BRUNET, "Nang Sbek, Danced Shadow Theatre of Cambodia," *World of Music*, 11:18–37 (1969), a brief and excellent description and history of Cambodian shadow theatre; SAMDACH CHAUFEA THIOUNN, *Danses cambodgiennes*, 2nd ed. (1956), the most complete history and analysis of plays, music, and dance of female and male dance-drama. (*Indonesia*): BENEDICT R.O'G. ANDERSON, *Mythology and the Tolerance of the Javanese* (1965), major *wajang* characters are described and their significance as behavioral models is treated; JAMES R. BRANDON (ed.), *On Thrones of Gold: Three Javanese Shadow Plays* (1970), translations, with description of action, music indication, and photographs, of three *wajang kulit* plays; CLAIRE HOLT, *Art in Indonesia* (1967), excellent chapters on *wajang kulit*, dance, and dance-drama in all parts of Indonesia; JAMES L. PEACOCK, *Rites of Modernization* (1968), the plays, structure and content, of *ludruk* in Java as seen through the eyes of a modern anthropologist; W.H. RASSERS, *Pañji, the Culture Hero* (1959), a disputed but brilliant theoretical discussion of the origin and meaning of Indonesian theatre; H. ULBRICHT, *Wayang Purwa: Shadows of the Past* (1970), useful for its extended translations of synopses of Pandawa plays found in J. KATS's famous Dutch work *Het Javaansche tooneel*, vol. 1, *Wajang Poerwa* (1923); BERYL DE ZOETE and WALTER SPIES, *Dance and Drama in Bali* (1938), an authoritative and encyclopaedic pre-World War II description of Bali's performing arts. See also I MADÉ BANDEM and FREDERIK E. DEBOER, *Kaja and Kelod: Balinese Dance in Transition* (1982); and ANA DANIEL, *Bali: Behind the Mask* (1981). (*Malaysia*): JEANNE CUISINIER, *Le Théâtre d'Ombres à Kelantan*, 2nd ed. (1957), Malaysian shadow theatre described and illustrated, with a partial play translation; RICHARD WINSTEDT, *The Malays: A Cultural History*, 6th ed. (1961), contains background information on Malaysian drama, including translations of pre-performance invocations. (*The Philippines*): JEAN EDADES (ed.), *Short Plays of the Philippines* (1950), a collection of recent one-act plays in English; ALBERTO S. FLORENTINO, *Outstanding Filipino Short Plays* (1961), short plays with two appendixes on traditional and modern drama in the Philippines; FRANCISCA TOLENTINO, *Philippine National Dances* (1946), descriptions and brief histories of many folk dances. (*Thailand*): UBOL BHUKKANASUT (trans.), "Manohra," in *Traditional Asian Plays*, ed. by JAMES R. BRANDON (1972), a translation with stage directions of the *lakon jatri* play "Manohra"; H.H. BRIDHYAKORN, "The Nang," 3rd ed. (1956), a short booklet on *nang yai* shadow play; and with DHANIT YUPHO, "The Khon," 3rd ed, (1956), a short booklet on *khon* masked pantomime; DHANIT YUPHO, *Classical Siamese Theatre* (1952), 52 folk and classical dance sequences described and illustrated; and *The Khōn and Lakon* (1963), synopses, commentary, and illustrations for 32 classic dance plays as performed by the Bangkok Department of Fine Arts between 1947 and 1960. (*Vietnam*): SONG-BAN, *The Vietnamese Theatre* (1960), brief descriptions of theatre in Vietnam.

Visual arts: PHILIP S. RAWSON, *The Art of Southeast Asia: Cambodia, Vietnam, Thailand, Laos, Burma, Java, Bali* (1967),

a comprehensive survey with many illustrations and plans; BENJAMIN ROWLAND, *The Art and Architecture of India,* 3rd ed. rev. (1967), sets the art of the region in relation to South Asian, or Indian art; WIM SWAAN, *Lost Cities of Asia* (1966), a pictorial study of Ceylon, Pagan, and Angkor; detailed articles in the *Encyclopedia of World Art* (1960–67): GEORGE COEDÈS, "Burmese Art," "Khmer Art," and "Cham Art"; A.B. GRISWOLD, "Siamese Art"; MADELEINE HALLADE and ROBERT HEINE-GELDERN, "Indonesian Art"; LOUIS BEZACIER, "Vietnamese Art"; and J.M.R. RIVIERE, "Philippine Art"—all these articles have extensive bibliographies. (*Burma*): A.B. GRISWOLD, CHEWON KIM, and P.H. POTT, *Burma, Korea, Tibet* (U.S. title, *The Art of Burma, Korea, Tibet;* 1964), the only survey of Burmese art; BURMA RESEARCH SOCIETY, *Fiftieth Anniversary Publications,* vol. 2 (1960), source material including important articles in English by G.H. LUCE and W.B. SINCLAIR. (*Champa*): The basic studies are PHILIPPE STERN, *L'Art du Champa (ancien Annam) et son évolution* (1942); and LOUIS BEZACIER, *Relevé des monuments anciens du Nord Viêt-nam* (1959). (*Siam and Laos*): Three basic sources include SILPA BHIRASRI, *Thai-Mon Bronzes* (1957), and *The Origin and Evolution of Thai Murals* (1959); and L. BORIBAL BURIBHAND and A.B. GRISWOLD, "Sculpture of Peninsular Siam in the Ayuthya Period," *Journal of the Siam Society,* 38:1–60 (1951). PIERRE DUPONT, *L'Archéologie mône de Dvāravatī* (1959), is the most authoritative study of this topic so far. The chief illustrated source for dating Buddhist art is A.B. GRISWOLD, *Dated Buddha Images of Northern Siam* (1957). See also CAROL STRATTON and MIRIAM M. SCOTT, *The Art of Sukhothai: Thailand's Golden Age* (1981), covering the period between the mid-1200s and the mid-1600s. (*Indochina*): JEAN BOISSELIER, *La Statuaire khmère et son évolution,* 2 vol. (1955), an exhaustive study of the development of Khmer sculpture; GEORGE COEDÈS, "Le Culte de la Royauté divinisée . . . ," *Série Orientale,* conference vol. 5 (1952), a basic iconographic study; PIERRE DUPONT, *La Statuaire préangkorienne* (1955), the authoritative book on pre-Angkor sculpture; LOUIS FREDERIC, *Sud-Est Asiatique: ses temples, ses sculptures* (1964; Eng. trans., *The Temples and Sculptures of Southeast Asia* (U.S. title, *The Art of Southeast Asia: Temples and Sculpture;* 1965), a well-documented pictorial survey; BERNARD P. GROSLIER, *Indochine: carrefour des arts* (1961; Eng. trans., *Indochina: Art in the Melting Pot of Races,* 1962), the most comprehensive survey in English; and with JACQUES ARTHAUD, *Angkor, hommes et pierres* (1956; Eng. trans., *Angkor: Art and Civilization,* rev. ed., 1966), a thoroughly documented pictorial survey. (*Indonesia*): F.A. WAGNER, *Indonesia: The Art of an Island Group* (1959), a comprehensive survey of Indonesian art in English; A.J. BERNET KEMPERS, *Ancient Indonesian Art* (1959), a comprehensive illustrated book. Major works on Borobuḍur include T. VAN ERP, *Beschrijving van Barabudur,* vol. 2, *Bouwkundige beschrijving* (1931); N.J. KROM, *Barabudur: Archaeological Description,* 2 vol. (1927); and PAUL MUS, *Barabudur, esquisse d'une histoire du bouddhisme fondée sur la critique archéologique des textes* (1935), which covers the subject of the role of Indian philosophy and theology as a background to Borobuḍur.

Southern Africa

The subcontinent of southern Africa is a vast region that includes the countries of Angola, Botswana, Lesotho, Malawi, Mozambique, Namibia, South Africa, Swaziland, Zambia, and Zimbabwe. (The island nation of Madagascar is excluded because of its distinct language and cultural heritage.) Southern Africa has been the background for a continuous political and economic struggle of European colonizers and the white elite of emerging nations with the diverse national groups seeking self-determination. Nowhere was this more in evidence than in South Africa, which since 1945 has been a frequent focus of world attention. The apartheid ("apartness") policy of the South African government, which established a system of strict racial segregation, evoked growing opposition from most other nations, especially as other prominent states in the area, such as Angola, Mozambique, and Zimbabwe (formerly Rhodesia), gained independence under majority rule. During this period, and in the 1980s in particular, the other southern African countries explored the possibilities of regional trade and cooperation as a means to their advancement. In the early 1990s South Africa dismantled its apartheid system and in 1994 held nonracial, democratic elections, thus opening the door to increased cooperation among all the nations of the region.

This article discusses the physical geography, settlement patterns, anthropology, economy, and history of the region of southern Africa, followed by separate treatment of the physical and human geography and history of each of the constituent states.

The article is divided into the following sections:

THE REGION

Physical and human geography

THE LAND

Geology. During the Triassic Period (245 to 208 million years ago) the continents formed a single landmass known as Pangaea. A southern continent, Gondwana (or Gondwanaland), formed about 180 million years ago as Pangaea began to divide. At this time Africa was attached to South America, but Antarctica had begun to split away. The separation of South America, Africa, and Madagascar began some 115 million years later.

The Sand River Gneisses of northern Transvaal formed about 3.8 billion years ago in the earliest part of the Precambrian (3.8 billion? to 540 million years ago) and are among the oldest rocks in the world. Other Precambrian rocks, as well as Cambrian and Ordovician rocks, are exposed over about a third of southern Africa. They are usually referred to as the basement complex, and, in most areas, the younger sedimentary rocks that mantle the basement complex have been metamorphosed or intruded by granite. The basement complex is well exposed on the Benguela and Niassa plateaus, in the Zambian-Zimbabwean Uplands, on the Damaraland Plain and southern African Lowveld, and in the Zambia-Niassa Trough and Limpopo Depression. Younger volcanic rocks that have intruded the Precambrian rocks occur throughout the basement complex. Important volcanic intrusions are the Witwatersrand System and Bushveld Igneous Complex in Transvaal and the Great Dyke in Zimbabwe. Linked to such intrusions are the economically important ore bodies and diamond pipes. Much of the basement complex has been uplifted and folded during periods of mountain building. The mountains formed during the Precambrian were eroded, and the resulting sediments were deposited on ancient erosion surfaces.

The basement complex

The rocks of the Karoo (Karroo) System were deposited between the Carboniferous (360 to 286 million years ago) and Early Jurassic (208 to 187 million years ago). They are mainly sediments derived from the erosion of basement-complex rocks under a variety of climates ranging from glacial to arid, although basaltic lavas (*e.g.*, Bataka basalts) are locally important. Later erosion and deposition have restricted outcroppings of the Karoo System to the rift valleys of Zambia and Zimbabwe and to an area encompassing much of southern Namibia and Cape Province and the Orange Free State in South Africa.

The Atlantic Coastal Plain in Namibia and Angola is bounded to the east by an ancient fault line, the Lunda Axis. There the granitic basement complex is overlain by folded and faulted rocks of the Cretaceous (144 to 66.4

million years ago) and Tertiary (66.4 to 1.6 million years ago), which in turn have been partially covered by Pliocene (5.3- to 1.6-million-year-old) sediments. The Mozambique Plain along the Indian Ocean coast probably formed during the detachment of Madagascar from the mainland, after which the plain was uplifted. There Cretaceous and Tertiary limestones, marls, and calcareous sandstones are overlain by Pliocene and Pleistocene (1,600,000- to 10,000-year-old) marine sands and clays.

The Kalahari Basin covers Botswana, northeastern Namibia, eastern Angola, and western Zambia. Its Tertiary and Quaternary rocks (those that formed from 1.6 million years ago to the present), which constitute the Kalahari System, have been deposited on Cretaceous sediments, which themselves were deposited on a Gondwana surface. These are for the most part sedimentary rocks derived from the erosion of the surrounding mountains. Fluvial (deposited by water) in origin, almost all the sediments have been reworked by the wind. The oldest rocks, the Botletle Sandstones and Grits, are overlain by the Kalahari Limestone Group, and overlying these are the Kalahari Sands. Sequences such as these can reach 1,000 feet (300 metres) in thickness.

Relief. The interior of southern Africa is dominated by a series of undulating plateaus that extend from the Cape provinces to central Angola. This area includes the southern African plateau, which covers most of South Africa, Namibia, and Botswana. Contiguous with this are the Zambian-Zimbabwean Uplands and Niassa and Manica plateaus in the northeast. This area is sometimes known as High Africa. The coastal margins are characterized by mountain ranges and coastal plains. Coastal mountains and escarpments, flanking the high ground, are well developed in northern Mozambique, South Africa, Namibia, Angola, and along the Mozambique-Zimbabwe border. Coastal plains abut the Indian Ocean in Mozambique and the Atlantic in Angola and Namibia.

Interior plateaus and coastal margins

The Kalahari Basin forms the central depression of the southern African plateau. Its elevation increases toward the plateau edge, and the highest ground, some 30 to 150 miles (50 to 240 kilometres) inland, forms the Great Escarpment that flanks the plateau in an almost unbroken line from the Zambezi River to Angola. The Great Escarpment was formed by prolonged uplift and includes ranges such as the Drakensberg and Stormberg and the Sneeu and Nuweveld mountains. The relative relief of some mountain ranges at the plateau edge is accentuated by the occurrence of deposits of Mesozoic lava (those formed from about 245 to 66.4 million years ago). The Drakensberg, which include the region's highest mountain—Lesotho's Mount Ntlenyana at 11,424 feet (3,482 metres)—are partially formed from such lava.

The plateau is divided into three altitudinal zones: the Highveld at altitudes greater than 4,000 feet, the Middleveld from 2,000 to 4,000 feet, and the Lowveld below 2,000 feet. The Highveld is well developed in the southern Transvaal region and Orange Free State, with important outliers such as the dolomitic Kaap Plateau, the Basotho Highlands, and the Transvaal Bushveld Basin, which is dominated by the Bushveld Igneous Complex. The Middleveld merges with the Highveld in most areas and is best developed in the western part of the region. It extends from the Namaqualand Plain northward through Namibia and into central Angola as far as the Bié Plateau. It includes the Namaland, Khomas, Otavi, and Chela highlands in Namibia, all of which are developed on the basement complex. The maximum extent of the Lowveld is in the Kalahari desert, the largest continuous sand surface in the world. Many dune fields are no longer active, and the fields of long parallel dunes have been attributed to drier paleoclimates that prevailed in the region in the late Quaternary. Saline depressions—pans—that occasionally fill with water are common landforms, although they vary greatly in size. The area includes two of the largest salt flats in the world—the Makgadikgadi and Etosha pans in northern Botswana and northern Namibia, respectively. The occurrence of river and lake sediments from these areas also attests to periods of wetter paleoclimates.

The Zambian-Zimbabwean Uplands are contiguous with the southern African plateau and form a flat planation surface at an altitude of 4,000 to 5,500 feet. The monotony is occasionally broken by isolated hills (inselbergs), mountain ranges (*e.g.,* the Muchinga Mountains in northern Zambia), and volcanic intrusions (such as Zimbabwe's long Great Dyke). On the plateaus most valleys are shallow, and the heads of drainage networks often form wide, streamless depressions known as dambos. Shallow lakes and swamps, such as Lake Bangweulu and the Kafue Flats in Zambia, are common. The only substantial valleys are formed by the Zambezi and Luangwa (Aruângua) rivers. Their courses are often fault-controlled, which has led to the creation of deep valleys, sometimes as much as 3,300 feet in depth. Dissection and local lithology often combine to create spectacles such as the Victoria Falls. To the east of the Zambian-Zimbabwean Uplands are the related Niassa and Manica plateaus, which form an undulating surface between 1,300 and 4,000 feet in altitude. These plateaus are formed from the basement complex, and

exposed granitic intrusions in the complex give rise to a series of resistant hills.

Erosion surfaces

The level to gently undulating plains in interior southern Africa are known as erosion surfaces. The breakup of Gondwana gave rise to a series of new erosion base levels as periodic regional uplift took place. Streams eroded down to these base levels, giving rise to plains that are still seen throughout the region today and that are known as the African erosion surface. At the end of the Miocene (23.7 to 5.3 million years ago) renewed tectonic uplift and tilting again created new base levels. Rejuvenated fluvial activity at this time cut down into previously weathered surfaces exposing resistant hills (*bornhardts*) and piles of partially weathered rocks (castle kopjes). The new plains formed at this time are known as the Post-African I erosion surface.

Dissecting the northeastern highlands and plateaus are the rift valleys of the Zambia-Niassa Trough. These were formed by a combination of pre-Karoo folding and post-Karoo faulting and are an extension of the East African Rift Valley. The main trough floor lies 1,000 to 3,300 feet below the adjacent plateaus. The best-developed rift valley in this region is occupied by Lake Nyasa (Malaŵi). It is bounded by the Kipengere Range and Livingstone Mountains in Tanzania and by the Nyika Plateau and Viphya Mountains in Malaŵi. Several troughs branch from it, such as along the Shire valley and the Gwembe-Lungwa trough.

Flanking the interior plateaus from southern Mozambique to northern Angola lies the Marginal Zone, which mainly comprises well-dissected rolling topography, although the extreme south is dominated by the basin-and-range topography of the Cape Ranges. These mountains were formed during the Permian (286 to 245 million years ago); the valleys deepened during the Triassic and Jurassic periods, forming the present landscape by the mid-Cretaceous. An important series of arid basins known as the Great Karoo lie at altitudes of 1,000 to 2,600 feet between the Great Escarpment and the Cape Ranges. In Namibia the coastal margin includes the Namib (Moçâmedes) desert and consists of four geomorphological regions: ridged topography (trough Namib), debris-covered surfaces (plain Namib), dune fields (dune Namib), and an interior range of well-dissected table mountains (Kaokoveld).

The coastal plains of Mozambique expand from a narrow strip in the north to a wide plain south of the Save River. The combination of low relief and runoff from the high ground to the west causes a considerable amount of flooding in the lagoons and swamps found on these plains. The coastal plain in northern Angola exhibits similar topography, although the south is occupied by the Namib desert.

The Zambezi and Limpopo rivers

Drainage. The region is generally drained eastward toward the Indian Ocean, a pattern exemplified by the largest rivers, the Zambezi and Limpopo. Some 2,200 miles in length, the Zambezi is the longest river in the region, and its catchment includes significant parts of Angola, Zambia, and Zimbabwe. Important dams at Kariba and Cabora Bassa restrict much of its flow. The 1,000-mile-long Limpopo, immortalized by the British author Rudyard Kipling as "the great grey-green, greasy Limpopo River, all set about with fever trees," drains large areas in Botswana and South Africa. Other important rivers draining eastward are the Lúrio, Pondo, and Save.

The only major river flowing into the Atlantic Ocean is the Orange (1,300 miles long), which drains parts of South Africa, Lesotho, and Namibia. The Orange is extensively used to provide irrigation water in South Africa, and the scale of withdrawals is so high that in some years the river barely reaches the sea. Two other rivers, the Kunene (Cunene) and Kwanza (Cuanza) in Angola, also drain westward.

The most interesting large-scale pattern is the radial drainage of the Bié (Angolan) Plateau, with tributaries of the Congo (Zaire) River heading northward, those of the Zambezi westward and southwestward, those of the Okavango (Cubango) and Kunene southward, and those of the Kwanza westward. Noteworthy is the Okavango River, which rises on the Bié Plateau, heads into the northern reaches of the Kalahari desert, and drains into the swamplike Okavango delta, never reaching the sea. Two further important internal drainage systems are found in the Kalahari Basin—the Etosha Pan in the northwest and the Molopo-Nossob system in the south.

Soils. A wide range of soils are found in southern Africa. They vary from the largely infertile and poorly developed soils found in the deserts and on higher mountain slopes to old soils with deep, well-developed profiles on some of the northern plateaus. This great diversity results from the many significant local variations in the region's climate, lithology, and topography.

In the arid parts of the region, the soils either show little development or are characterized by soluble salt accumulations in their topsoils. Soil types are differentiated largely on the basis of their mineral composition. Calcisols are rich in calcium carbonate, gypsisols in gypsum, and solonchaks and orthic solonetz are often rich in halite. On the drier semiarid plateaus a larger fraction of the soil texture is clay. Somewhat more fertile planosols, vertisols, and cambisols are common. In wetter areas and on the northern plateaus the most common soils, ferralsols and luvisols, are found. Dominated by the movement of humus, minerals, and clays from the topsoil to subsoil, these soils are the most widespread in southern Africa. Sand-

rich arenosols have their maximum development on the Kalahari Sands in Angola and Zambia, and nutrient-poor, sand-rich regosols cover large parts of Angola. Histosols, rich in organic matter, are found locally in Malawi and Zambia.

The fertility of many of the soils in arid and semiarid areas is low because of the lack of organic matter in the topsoil and the slow rates of breakdown resulting from a lack of moisture. In most areas, the agricultural exploitation of such soils depends on irrigation, although this can lead to salinization and waterlogging. Luvisols are perhaps the most fertile soils in the region; they are extensively used by both large-scale commercial and small-scale peasant farmers. Ferralsols are generally infertile because their age and location on the high plateaus have resulted in the loss of most of their nutrients by leaching. Many of the region's soils are prone to water and wind erosion when cultivated; soil erosion by water is severe in some parts of Zimbabwe, Swaziland, Lesotho, and South Africa.

Climate. Southern African climates are seasonal, ranging from arid to semiarid and from temperate to tropical. The seasonality is an important control on plant growth and a regulator of river flows. Moreover, it affects soil and landform development through its controls on rock weathering and water and wind erosion.

Effects of seasonality

In the summer (October to March), a prolonged low-pressure system develops over the region, drawing in moist air from the surrounding oceans. The converging moist air rises and cools, giving rise to intense rainstorms. In the winter (April to September), low-pressure areas move northward, and the influx of high pressure over the region leads to stable, dry conditions, although wet, westerly winds continue to bring rain to the southern Cape region. The lack of cloud cover over most of the region in winter leads to ground frosts, and these, combined with very low humidities in some areas, cause black frosts, which damage the more vulnerable broad-leaved plants.

The climatic seasonality creates four climatic zones. Western Cape province has a warm temperate Mediterranean climate with cool, wet winters and hot, dry summers. The mean annual rainfall at Cape Town is 20 inches (510 millimetres), most of which falls between April and September; mean daily maximum temperatures reach 79° F (26° C) in February, the warmest month, and drop to a low of 63° F (17° C) in July. The interior plateaus have a semiarid steppe climate characterized by great extremes of temperature between the winter and summer months. In the Highveld to the south the climate is temperate, but at lower altitudes and farther north the climate varies between tropical and subtropical. Most rain (28 inches at Johannesburg and 33 inches at Lusaka) falls in summer. The winters are dry, with a high diurnal temperature range. Mean daily maximum summer temperatures range from 75° to 78° F (24° to 26° C) at Johannesburg and from 78° to 88° F (26° to 31° C) at Lusaka. The mean daily maximum temperatures in winter range from 62° to 77° F (17° to 25° C) at both stations, with Lusaka being slightly warmer on average. The eastern part of the region has a subtropical to temperate maritime climate with high year-round precipitation due to the orographic effect of the Great Escarpment on easterly winds. The rainfall amounts are greatest in the summer, however. At Maputo on the Indian Ocean coast, the mean annual rainfall is 30 inches, and the mean temperatures range from 75° F (24° C) in July to 88° F (31° C) in February. The Namib desert has a tropical arid climate with very little rainfall. The mean amount of precipitation at Namibe (formerly Moçâmedes) on the Angolan coast, for example, is about two inches, and at Walvis Bay, farther south along the Namibian coast, it falls to only one inch. Frequent condensation from coastal fog (known as *caicimbo* in Angola) does occur, however, providing some additional limited moisture. These fogs roll inland off the South Atlantic and are formed when moist air cools to its dew point and condenses as it passes over the cold surface waters of the Benguela Current.

Droughts are common in much of southern Africa, and there is evidence that an 18-year cycle of drought occurs in parts of the region. Drought was widespread in the 1960s, and the early 1980s saw droughts in Botswana, South Africa, and Zimbabwe. Their effects were mainly restricted to semiarid areas.

Plant life. Four main types of vegetation are found in southern Africa. The north is dominated by savanna woodlands known as miombo forest. To the south of these are a series of dry woodlands. Arid and semiarid grassland, shrubland, and bushland dominate the Namib and Kalahari deserts and their environs. Mediterranean vegetation is found along the southern coast.

Woodlands

Miombo woodlands stretch from the Bié Plateau through Zambia and Malawi into northern and central Mozambique and south into Zimbabwe. They are characterized by a 20- to 100-foot-high single story of tree canopy that is open enough to allow a grassy understory. Deciduous species of the genera *Brachystegia* and *Julbernardia* dominate the overstory.

To the south of the miombo forest is a belt of dry woodlands stretching from southern Angola and northern Namibia into southern Mozambique and Swaziland. Most extensive are the *Acacia*-dominated woodlands. In southeastern Angola, western Zimbabwe, and Zambia, *Baikiaea* woodlands, dominated by the Zambezi teak (*Baikiaea plurijuga*), and wild seringa (*Burkea africana*) savannas have developed on the Kalahari Sands. Mopane woodland, dominated by *Colophospermum mopane*, is another distinct type of dry woodland. It is common in southern Angola and Botswana, although it extends as far north as southern Malawi. In the Kalahari, woodlands dominated by *Acacia* species and *Boscia albitruncata* are well developed.

Arid and semiarid vegetation dominate the Namib and Kalahari and the areas surrounding them. The two most extensive vegetation types are the veld grasslands (and, less commonly, wooded grasslands) and the succulent, or sclerophyllous, shrublands. The former are most common in the high continental interior (*e.g.*, the Transvaal region), whereas the latter dominate South Africa's Cape provinces and southern Namibia.

Mediterranean vegetation is found along the mountainous southern and southeastern coast. Diverse and luxuriant temperate woodlands are found in a number of moister sites, but woodland and thickets (macchia, or *fynbos*) of evergreen sclerophyllous species are more common. Species of *Protea* are found in these areas.

Of limited areal extent and only locally important are the subalpine and alpine grasslands and heathlands found in Lesotho and surrounding parts of South Africa. High altitudes and cooler temperatures also give rise to the unique coniferous forests of the Drakensberg.

Deforestation is mainly caused by land clearance for agriculture, the collection of domestic fuelwood, and the felling of timber for construction. The main areas of deforestation are along the "Line of Rail" in Zambia, central and southern Malawi, on the Highveld and in the Limpopo valley in Zimbabwe, in southern Mozambique, in southwestern Angola and adjoining northwestern Namibia, in Swaziland, and in parts of northern and eastern South Africa. Reforestation is generally on a small scale throughout the region, although there are important conifer plantations in South Africa and Swaziland.

Animal life. The semiarid plains and plateaus that cover much of the region contain animals commonly associated with the East African plains—*e.g.*, antelope, gazelle, elephant, and the big cats. However, different animals are found in the coastal woodlands of South Africa and in the desert regions to the north and northwest. Many habitats have been extensively modified by agriculture, thus restricting the ranges of certain species that were formerly more widespread.

Endangered species

Most of the endangered species (*i.e.*, those under immediate threat of extinction) in southern Africa are mammals, especially large mammals, but, if vulnerable species are included, some reptiles are also threatened. Endangered species include the giant golden mole (*Chrysopalax trevelyani*), riverine rabbit (*Bunolagus monticularis*), and Cape mountain zebra, all of which are found only in South Africa; the black-faced impala in Namibia; the sable antelope from Angola; and the black rhinoceros, which is

mainly restricted to Zimbabwe. The only endangered bird is the Cholo alethe found in Malawi.

Vulnerable mammals include another species of zebra, the Hartmann's mountain zebra of Namibia, as well as the cheetah, brown hyena, lechwe, African elephant, African wild dog, and bontebok. The Smith's dwarf chameleon and the geometric tortoise, found in the Cape region, are vulnerable species of reptile, as is the Nile crocodile, found along the Zambezi. The Cape platanna, an aquatic frog, is also vulnerable.

Cape mountain zebra (*Equus zebra zebra*) number fewer than 500 and are almost entirely restricted to the Mountain Zebra National Park in South Africa. The geometric tortoise (*Psammobates geometricus*) is found only in the Cape region. Its near extinction has been brought about by the destruction of its habitat by agricultural and urban expansion—less than 5 percent of its natural range remains. The best-known vulnerable and endangered species are the African elephant (*Loxodonta africana*) and black rhinoceros (*Diceros bicornis*). In both cases, hunting and poaching—for ivory in the case of elephants and potions and dagger handles (popular in Yemen) in the case of the black rhinoceros—have significantly reduced their numbers.

Conservation measures are variable in their application. Namibian wildlife officers have begun to saw off rhino horns to make them less attractive to poachers, although most southern African countries oppose the ban on the ivory trade. There are 16 large national parks and game reserves in the area, as well as many smaller ones. Most of them are located in the open or partially wooded plains, the most famous being South Africa's Kruger National Park. (A.C.Mi.)

THE PEOPLE

Contemporary ethnicity and class structure were forged in southern Africa within a crucible of interacting ethnic units, not through a process of timeless, apartheid-like separation of one cultural "tradition" from another. Many of these transformations were indigenously inspired and followed upon the introduction and adoption of agricultural and pastoral economies and metallurgy at the beginning of the 1st millennium AD. Others came about as responses to new opportunities and conditions originating outside the continent, first with the introduction of intercontinental trade at the end of the 1st millennium and, later, with European colonization. In the first instance, principles of kinship, residence, and tenure were flexibly adjusted to accommodate changing political and economic opportunities. In the second, a 20th-century ethnic consciousness was constructed using past history, language, and culture as the building blocks from which to create a new ideology.

Language groups. The peoples of southern Africa today can be divided into speakers of two language families, Khoisan and Bantu. The linguistic differences separating these families are great, attesting to a long history of separate development before their present juxtaposition south of the Zambezi River. In earlier times, Khoisan languages were spoken over most of eastern and southern Africa. They have now been displaced in many areas by Bantu languages and, in parts of Namibia and in the Cape region of South Africa, by European languages.

Khoisan. Taking each family separately, Khoisan peoples can be further subdivided into San and Khoi groupings. ("Khoi" is an ethnic term and "Khoe" is linguistic; that is, Khoi peoples speak Khoe languages.) In former times the pejorative terms "Bushmen" and "Hottentots" were often used to refer to these sub-groupings: "Bushmen" if they lived by hunting and gathering; "Hottentots" if they were herders. The diversity encompassed by languages of this family is a testament to its great antiquity in southern Africa. San languages include both Northern (Zhu and !xũ) and Southern (of which only /nhuki, //xegwi, and !kò are extant) variants. A wedge of Khoe languages spoken in the central Kalahari separates the Northern from the Southern San. Today only a few Khoisan speakers hunt and gather for substantial portions of their livelihood, mainly on the northern and southern flanks of the Kalahari desert in Botswana and Namibia. Even there they supplement their diet with domestic grains and milk while tending herds of cattle, goats, and sheep.

Click languages

A characteristic of Khoisan languages is their widespread use of click sounds as consonants (more than 70 percent of San words begin with a click). Each click has a distinctive set of accompaniments (effluxes) that combine to produce as many as 85 distinct click segments, making these languages among the world's most phonetically complex. Although commonly grouped into a single language family, the linguistic differences separating Khoe and San are great, and some scholars dispute the merger. They argue that this results in an artificial grouping of historically unrelated people. Such linguistic divergence is not totally unexpected, however, and may simply reflect thousands of years of social differentiation occurring among small, isolated hunting bands.

Khoe speakers include people in southern Angola and the Okavango delta (Kwadi, Kxoe, Buga, //ani), the central Kalahari (G/wi, G//ana, Naro), and the Khoikhoi speakers of Namibia (Nama) and the Cape provinces of South Africa (!ora). Some linguists would include the Tanzanian languages of Sandawe and possibly Hadza as distant relatives of the Khoe subgroup. If accepted, this would serve to extend the prehistoric distribution of this group well northward into East Africa. In contrast with San hunters, Khoi were thought of as the archetypal pastoral nomads of southern Africa even though some, such as those in the central Kalahari, were labeled as "Central Bush" because they were living as hunters and gatherers at the beginning of the 20th century. That this was not always the case is indicated by linguistic data that traces the origins of Khoi herding to this same region approximately 2,500 years ago. From this area they spread southward, reaching as far as the Cape by the 1st century AD. Ceramics and remains of domesticated sheep found in Late Stone Age contexts there indicate that an indigenous transformation from foraging to pastro-foraging (herding and foraging) had already begun before the first Bantu farmers arrived.

South of the Limpopo, Khoisan herders were the probable source of cattle and sheep for newly arrived Bantu farmers—not the reverse. The use of Khoisan-derived terms for these domesticated animals is universal among southeastern Bantu peoples such as Zulu, Xhosa, Sotho, and Tswana. This points to a long and stable history of relations between these peoples and Khoisan pastro-foragers in the region. Except in the case of 17th- and 18th-century northward migrations of southeastern Bantu speakers, these terms are not used north and east of the Kalahari.

Additional evidence for long-term interaction is provided by the click sounds incorporated in many Bantu languages, including Yei, Kgalagadi, Sotho, Zulu, Ndebele, and Xhosa. These are distributed from north to south following the 20-inch-rainfall isohyet that divides the subcontinent into agricultural and pastro-foraging economic zones. West of this line, conditions favoured the formation of convergent economies that utilized indigenous wild species adapted to these drier environments and livestock that could be seasonally moved to follow the rains and changing availability of pasturage. Compound economies formed, with autochthonous (indigenous) foragers and food producers coexisting with, and complementing, Bantu economies up to the present day. Because of low and unreliable rainfall, hunting and gathering was more heavily, or at least more obviously, relied upon than it was farther east. Considerable evidence for genetic admixture also occurs along this line, with some groups, such as the Deti and Tshukhoe in central Botswana and the Damara (Bergdama), Hain//um, and Kwadi of northern Namibia, being dually classified as genetically Bantu but linguistically Khoi. While some herders of Khoi ancestry still live in parts of Namibia, many of them now speak Afrikaans (a European language derived from Dutch) rather than Khoisan and live like Afrikaner farmers. Khoi peoples have almost entirely disappeared from the Cape area, most being absorbed into other ethnic elements, particularly the mixed-race ("Coloured") population.

Bantu. The large linguistic differences separating languages of the Khoisan family are not paralleled to the

same extent in the Bantu family, even though members of the latter are much more widely dispersed across central and southern Africa. This reflects the recentness of their divergence from a common ancestral language. Originally, proto-Bantu was spoken only in a small area north of the tropical forests in the grasslands of present-day Cameroon. About 3,000 years ago, however, an expansion of Bantu speakers began that resulted in their covering most of Africa south of the Equator by the 3rd or 4th century AD. The reasons for this expansion are presently unknown, though it could be related to the acquisition of new technologies, such as pot making, or new crops, such as sorghum, millet, and perhaps bananas, that enabled them to more efficiently exploit the forest margins. This initial migration took place at a "Neolithic" stage of development; knowledge of metalworking had not yet penetrated south of the Sahara. Reconstruction of proto-Bantu vocabulary shows that these people made pottery and had begun to cultivate, or at least intensively exploit, indigenous oil palms and yams before their expansion southward. They also kept goats but probably not cattle.

Spread of Bantu languages

Traditional cultures. *The spread of Eastern Bantu.* Early in their history, a division of Bantu into two major branches—Eastern and Western—took place. Some authors put this split at the very beginning of Bantu expansion from Cameroon. Others suggest it occurred later, and much farther south, in the area centred on the lower reaches of the Congo River. The earliest remains of mixed-farming settlements in the area immediately west of Lake Victoria date to the 2nd and 3rd centuries BC. These sites provide the first indications of the arrival of Eastern Bantu in the region and contain remains of iron smelting as well as distinctively decorated pottery. Sorghum and millet, the principal domestic crops, were acquired through contact with farmers living along the grassland savannas north of the forest after Eastern Bantu diverged from Western Bantu. Cattle were kept, perhaps adopted through contact with Central Sudanic herders in the region to the west and south of the upper Nile.

Routes of Eastern Bantu expansion

By the 1st century AD, Eastern Bantu had spread southward around the East African Rift Valley to the Kenya coast. Related settlements dating from the 3rd and 4th centuries line the Indian Ocean as far south as KwaZulu/Natal in South Africa. Ceramics and evidence of ironworking are common on these coastal sites, but no remains of domestic stock have been found. Instead, shellfish were relied upon as a source of protein.

A second route of Eastern Bantu expansion lay inland, along a course between Lake Nyasa and the eastern Kalahari. Along this route, tsetse-fly-infested areas could be avoided by Iron Age agro-pastoralists, giving them an opportunity to bring cattle across the central Zambezi onto the high plateaus of Zimbabwe and Northern Transvaal. Evidence for cattle-keeping farmers on the Highveld bordering the Limpopo River becomes abundant after the 4th century AD.

Today, Eastern Bantu-speaking societies south of the Zambezi include the Shona and Tonga of present-day Zimbabwe and Mozambique, the Northern Nguni (Swazi and Zulu) and Southern Nguni (Pondo, Tembu, and Xhosa), who occupy the coastal Lowveld of KwaZulu/Natal, and Sotho-Tswana peoples who are found on the southern African Highveld from the Transvaal region through eastern Botswana to the southern edge of the Okavango delta.

Western Bantu expansion. The Western Bantu branch expanded directly southward from Cameroon through a broad area where the Eastern complex of cereal grains, cattle, and sheep were not well adapted and in which they are virtually absent today. The fact that all Western Bantu vocabulary for sorghum and millet derives exclusively from Eastern Bantu indicates this complex spread westward below the tropical forest at a later date. Cattle, in addition, seem only to have arrived west of the Okavango River in southern Angola about the middle of the 1st millennium AD. Lexical data from Western Bantu languages such as Herero suggest that they acquired these animals directly from Eastern Bantu sources. Between the Okavango and the upper Zambezi, however, the situation is more complex, and evidence there indicates that indigenous Khoisan foragers, fishers, and cattle nomads were already present when Bantu speakers first arrived. West of the Okavango, it is uncertain whether domestic cattle and sheep passed independently to Khoisan and Western Bantu or whether the use of these animals spread as a single complex together with cereal grains. The distribution of terms for a number of varieties of banana provides indications for yet another early diffusion of cultivars from east to west, this time perhaps through the forest rather than around its southern edges. Fishing, foraging, oil palms, and shellfish and other aquatic resources contributed significantly to the early Western Bantu diet. Goats, cowpeas, and indigenous yams were also important.

Early ironworking

The earliest evidence of ironworking south of the Sahara dates to the 6th century BC in the upper Nile and to the 5th century BC in Nigeria. By the 3rd century, iron was being worked as far south as Gabon and the Congo. Below the Equator, dates from the west coast are coeval with those from sites in East Africa. As a result, the possibility cannot be ruled out that iron smelting diffused southward to Neolithic Bantu along two separate routes: one eastward from sources in the upper Nile and the other southward from early centres in Nigeria or the western Sahel. In addition to its productive use for tools such as hoes, axes, knives, and spears, iron (and copper) functioned as luxury trade goods, creating and sustaining intercommunity relations across the region. Once the techniques of metallurgy were known, they spread quickly through sub-Saharan Africa, reaching as far south as the Transvaal region and KwaZulu/Natal by the 3rd or 4th century AD.

The acquisition of cereal crops, domesticated cattle, and sheep facilitated the expansion of Western Bantu speakers into the drier savannas of southern Angola and western Zambia. Initially, the network of southward-flowing rivers provided the main avenues of inland movement; the Atlantic coast also was exploited. Exchange of salt, fish, and probably metals kept the peoples of these different environments in contact. Metalworking, in particular, was of great importance to the developing political economy of the Angolan region. Metal served as a commodity of exchange, a store of wealth, and a symbol of chiefly authority. Over time, the Western group differentiated into Umbundu and, farther south, into the Bantu languages of southern Angola, northern Namibia, and northwestern Botswana: that is, into present-day Ambo, Herero, Kwangari, Nyaneka, Ndombe, Ngonyelu, and Ngumbi. Middle Zambezi peoples, including the Mbukushu, Subia, Koba, and Tonga, also are related to this group.

The diversification of farming communities in southern Africa. After the arrival of Bantu farmers in the 3rd and 4th centuries AD, a period of radiation and adaptation to the varied environments of southern Africa ensued. New ecological relationships were established as fields were cleared and planted and as domesticated animals increased in number to compete with indigenous fauna for grazing and water. Iron and copper were prospected for, mined, and smelted, and larger populations settled in more permanent villages than was common for earlier foragers. A combination of local movements by farmers seeking new fields and pastures and the adoption of new technologies by indigenous hunters and gatherers resulted in a complex intermingling of peoples and economies below the Zambezi, Okavango, and Kunene rivers. A dichotomization of southern African peoples into foragers and farmers—Khoisan and Bantu—oversimplifies what was a more synergistic regional political economy. At the time of Bantu entry into the region south of the Zambezi 2,000 years ago, there was thus less material differentiation among peoples than was to appear later; progressive linguistic and ethnic diversification was a feature of the political transformations of the 2nd millennium AD. Overall, there is little evidence for a rapid domination of the subcontinent by these newcomers.

Effects of rainfall on culture

Rainfall had a profound influence upon the development of southern African societies, and ways of life varied directly in proportion with decreases in rainfall from east to west. The 20-inch isohyet marks the effective limit of arable land. This rainfall line cuts diagonally across the region from the Okavango delta to the central Limpopo

valley and then turns southward to run along the western side of the Drakensberg. As one moves west from this line, rainfall decreases and, in concert with this change, the contribution of livestock to the local economy increases. Soon after their introduction, cattle, goat, and sheep populations exploded in the drier portions of the subcontinent where nutritious grazing land was abundant and animal diseases were few. Such changes reflect the outcome of common ecological processes whereby rapid increases in population often occur as a matter of course when new species are introduced to colonize favourable environments. (Increases in cattle, sheep, and other animal populations following the European settlement and colonization of the American Southwest and Australia provide familiar examples of this.) In Iron Age Africa, such developments had important social and political repercussions; between AD 500 and 900 early mixed farmers exploited the potential for herd expansion offered by these rich grasslands. Archaeological sites in Botswana, Zimbabwe, and South Africa contain evidence in the form of dung deposits, some more than six feet deep, that attest to this increase in the importance of the pastoral sector of early farming communities. This was particularly true for the region west of the 20-inch rainfall line.

The impact of these changes is reflected in the layout and organization of early settlements. Typically, thatch-roofed houses constructed of closely spaced poles and sticks plastered over with a mixture of animal dung and clay were arranged in a semicircle around a central animal byre. Most such houses were between four and six feet in diameter; family compounds were composed of several such units functioning as separate sleeping, storage, and cooking areas. The deep dung deposits found at many of these Iron Age villages indicate that cattle and other domestic stock were closely watched and were probably returned to the village each evening in order to ensure their security against predators such as lions, as well as to protect them from cattle raids by neighbouring groups. Burials of men in these central cattle kraals indicate that some elements of traditional values, rituals, and beliefs can be traced back at least 1,000 years in this region. In contrast to the central location of livestock pens, grain supplies were individually held in granaries associated with each homestead or compound. Indications of communally held grain buried in dung-lined pits under the central cattle kraals have also been found. In historic times, such grain was controlled by central authorities and was used as a reserve or shelter against times of drought or warfare, when it could be dug up for redistribution.

The early development of large chiefdoms in the Limpopo valley was clearly associated with increases in cattle and their use as wealth. Both there and in neighbouring eastern Botswana a hierarchical social structure, with an associated settlement pattern based upon central towns surrounded by smaller satellite villages, had emerged by the end of the 1st millennium AD. Farther east, where rainfall is higher and more reliable, cattle herds were smaller and agriculture contributed a larger proportion of the subsistence diet. Such regional contrasts were important to the developing political economy of southern Africa. In the east, Iron Age Bantu mixed farmers gradually gained a dominant position over autochthonous foragers and pastro-foragers, ultimately subjugating, absorbing, or eliminating them. A hierarchy ensued, with foragers relegated to marginal social and economic positions. In the west different processes of interaction led not to population absorption or replacement but to an articulation of herders and foragers into multiethnic compound economies that continued into the 20th century.

The east-coast trade and political transformations. Linkages with Arab traders on the Mozambique coast were well established by the end of the 1st millennium AD. Long-distance trade was not a new innovation but simply grafted onto already existing regional networks along which cattle, salt, fish, metals, chert, ostrich eggshell beads, and other items had been flowing for many centuries. People of all ethnic backgrounds participated in the trade, funneling locally made and acquired goods to the east coast through indigenous entrepôts such as Bambandyanalo in the Limpopo valley and Toutswe and Bosutswe in eastern Botswana. By AD 900 inter-regional exchange networks stretched completely across the subcontinent from the east coast to the headwaters of the Okavango delta in southern Angola. Hunted products, including ivory, carnivore skins, and rhinoceros horn, were among the most highly valued items offered for trade. Most of these goods were probably obtained by indigenous foragers who intensified hunting activities in order to supply increased external demand for these exotic commodities; cattle, pottery, metals, and other locally produced items supplied intraregional requirements. Glass beads, marine shells, and cotton cloth were among the main items provided in exchange. These high-prestige goods served to enhance the political value of the trade to local elites who directed and controlled it.

Exchange networks

Iron and copper were extensively mined, smelted, and traded during the 1st millennium, but there is no evidence that gold was used. The 13th-century burial of an important official uncovered at Mapungubwe in the Limpopo valley—accompanied by a gold-covered statue of a rhinoceros, a golden staff, and other artifacts—is perhaps one of the earliest indications of gold mining in southern Africa. The Mapungubwe gold was panned from alluvial deposits, but, by the last half of the 2nd millennium, more than 1,000 underground mines had also been dug into the granitic bedrock of northeastern Botswana and neighbouring Zimbabwe, in some cases following ore seams down to depths of more than 100 feet. From the 13th century onward, gold was strongly associated with elite status. It was undoubtedly the most highly prized item sought by east-coast traders, taking the place formerly held by ivory. The rise of the Great Zimbabwe kingdom about 185 miles northeast of Mapungubwe is associated with this change, which, over the next 200 years, resulted in the consolidation of Shona political hegemony across the high central plateau.

With the discovery of gold, a devaluation in cattle as the principal repository of political and economic capital took place across the gold-bearing regions of northeastern Botswana and Zimbabwe. One indication of this change is suggested by the fact that livestock were no longer kept in large numbers at elite centres, as was common in former times. Instead, they were dispersed among commoners living in smaller villages and hamlets in the hinterlands. The symbolic role of the central cattle byre at earlier sites was replaced by elaborate stone walling constructed around the chiefly residences built at Great Zimbabwe and at smaller regional centres and towns from the Makgadikgadi salt pans in the west to the Mozambique coast in the east. These stone buildings served as the political centres of Shona hegemony.

In concert with the political and economic transformations that accompanied the rise to power of Great Zimbabwe, the value of trade networks reaching out to the cattle-rich areas of eastern Botswana, and beyond them to the hunting grounds of the Okavango, fell. In eastern Botswana disruption of these long-distance routes contributed to the collapse of the political hierarchies they had formerly supported. West of the Okavango, similar political and economic retrenchments occurred as the somewhat weaker economic base of emerging elites in this area was eroded and their settlements abandoned. When first encountered by Europeans toward the middle of the 19th century, Khoe-speaking and Herero (Western Bantu) herders dominated the drier central Namibian grasslands. Farther east, Mbukushu (Western Bantu) and Tswana (Eastern Bantu) mixed pastoralists were in control around the Okavango delta, with Khoi, San, Koba, Yei, and others subservient to them.

Disruption of trade networks

South of the Limpopo on the open grasslands of the Transvaal and Orange Free State, the central economic, social, and symbolic importance of livestock continued into the 2nd millennium as cattle-based chiefdoms emerged in the 15th and 16th centuries as a prelude to later Sotho and Tswana chiefdoms. Stone walling was also used extensively on these sites, but, rather than represent a break with the past, these walls provide evidence of continuity with the earlier pattern of central cattle byres surrounded by granaries and family housing compounds. Discontinu-

ities in pottery styles, however, suggest new population elements may also have moved southward into the region, becoming incorporated in the political restructuring that was spreading across southern Africa during the last half of the 2nd millennium.

Traditional agriculture

Subsistence economy. Sorghum and millet were the traditional subsistence crops of southern Africa, the soil being tilled with hand-held hoes fashioned of iron or wood. These traditional staples, while still grown in the drier regions, have now been replaced in most areas by higher-yielding corn (maize), beans, peanuts (groundnuts), and sweet potatoes of American origin. In mixed agricultural areas where cattle are present, southern Africans have also shifted from labour-intensive hand-cultivation techniques to ox-drawn plows in order to overcome the problems of low per-acre productivity and traditional peak-season labour shortages. In the past almost all households were engaged in some combination of agriculture and herding, with craft specialties such as pot making and iron smelting usually taking place during the dry season when labour was not demanded in the fields and pastures. Rights to land were vested in tribal membership, and, with adequate land resources, unequal agricultural production was based upon unequal access to labour.

Because nonfamily labour was in short supply, reciprocal work parties, polygamy, and slavery were the most common methods used to overcome peak-season labour constraints. Low population densities, simple transport systems, and poor storage facilities meant that few households had an incentive to produce a surplus much above what was needed for domestic consumption. Prior to the end of the 19th century, when the ox-drawn plow was widely adopted, discrepancies in wealth were therefore not generally based upon differences in surplus agricultural production. With the plow, wealthier families who had access to oxen could increase production. Demand for agricultural labour diminished proportionately, and it is perhaps no accident that in areas where the plow was widely adopted, such as the eastern Kalahari, polygamy disappeared soon afterward.

Cattle as a store of wealth

Cattle production was not as directly tied to labour. Their meat, milk, and skins contributed importantly to the subsistence economy; an additional function of these animals was to serve as a traditional store of wealth and a medium of exchange. Cattle were the most important source of capital investment; a man's wealth was generally estimated by the size of his herd. They were also a major source of political and economic power. Throughout the region where they were kept, institutionalized mechanisms existed through which wealthy men could gain political support by judiciously loaning out cattle to those who had few or no animals. This, and the rapid rates of herd increase experienced in the area, meant that, while returns to traditional agricultural production were low, cattle were a means to the accumulation of wealth. The increased value of oxen as draft animals, brought about by the introduction of the plow, reinforced these discrepancies. Families who lost their herds through misfortune were limited from full participation in the spheres of life that required capital and remained tied to the system through subservience and dependency to the owners of large herds.

Contemporary southern African societies. Differences in the amount and type of movable wealth from west to east across southern Africa underlay differences in the structure of social life. Variations in lineal inheritance patterns, descent, and residence after marriage, for instance, correlate with the amount of moveable wealth, particularly cattle, found in an area. In areas where they were present, cattle constituted the bride-price (*lobola; bogadi*) exchanged for a wife, her labour, and the right to all the children born. Residence after marriage was related to the amount of bride-price paid or promised. In southern Angola, northern Namibia, and northwestern Botswana, where cattle and other livestock are numerous, payment of bride-price is the norm, and residence is patrilocal (with the husband's family) or avunculocal (with the husband's maternal uncle). Among the cattle-rich societies such as the Tswana of eastern Botswana and South Africa, bride-price is uniformly high, and inheritance and descent are reckoned along patrilineal lines. Residence is normally patrilocal. Those who cannot afford to pay with cattle or other valuable goods generally perform bride service—and reside matrilocally (with the wife's family) for an agreed-upon period of time. In parts of Zimbabwe where cattle are fewer, such as among the Tawara and Zezuru, most marriages were of the second type, with prolonged matrilocal residence. In central Zambia, where inheritable wealth is almost nonexistent, matrilineal descent with bride service and matrilocal or avunculocal residence were most common.

Cattle were the most important objects of sacrifice, linking men to the spiritual world, and, in former times, they figured prominently in rainmaking and rites of passage as well. Among the Herero and neighbouring southwestern Bantu peoples, every adult male was given a set of "sacred" cows by his father and his mother's brother. These were dedicated to the spirits of deceased maternal and paternal relatives. At his death, some were sacrificed and the remainder redistributed back to designated relatives. Even the layout of southern African homesteads, with thatched houses grouped around central animal byres, reflected the symbolic and economic centrality of herding to these cultures. The bodies of important men and chiefs, ancestors who would be called upon in times of need, were buried under these central cattle kraals, reinforcing their symbolic centrality.

Kinship systems

With one major exception, the system of Iroquois kinship terminology is used throughout the region. This terminology differentiates parallel cousins (father's brothers' and mother's sisters' children) from cross-cousins (father's sisters' and mother's brothers' children), with parallel cousins usually being referred to by the same terms as those used for brother and sister. Marriage with parallel cousins is generally not permitted, but cross-cousin marriage—particularly with the mother's brothers' daughter—was often preferred. In both matrilineal and patrilineal systems, such marriages serve to reinforce linkages between lineages. In matrilineal regions, marriage to the mother's brother's daughter kept men of the same lineage together, rather than dispersing them to a number of different villages. The reverse pattern, marriage to the father's sister's daughter, is rarer, but it does occur among cattle-rich groups such as the Tswana and the Herero, where it was preferred by elites and rich commoners as a strategy to keep bride-price payments recirculating within the group.

The only exception to the use of Iroquois kinship terminology are the Shona and Thonga of Zimbabwe and Mozambique, who use Omaha kin terms. This terminology serves to set apart males linked to each other by descent through men only and is widespread among strongly patrilineal societies. In contrast with Iroquois patterns, cousin marriage is strictly forbidden, and individuals are encouraged to marry outside the local group. This is a good strategy in situations where it is desirable to create as many diverse marriage ties with strangers as possible. This was certainly the case during the period of Zimbabwean hegemony in the 15th and 16th centuries when male members of royal rank were assigned as headmen to outlying settlements according to their status. Marriage or concubinage alliances were important instruments of policy, and it is possible that the interesting variation in kinship terminology found among the Thonga and Shona between the Kalahari and the east-coast region is a testimony to these early political processes. (J.R.De.)

THE ECONOMY

The economies of those countries constituting southern Africa are highly diverse in terms of human and natural resources; the structures of these economies are also extremely heterogeneous. They have, however, shared many of the problems that have plagued the continent as a whole. These include wars, political instability, drought, fluctuations in export commodity prices, and declines in the capacity to import. As a consequence, in the 1980s many of these countries were compelled to adopt severely deflationary structural adjustment programs, usually under the auspices of the International Monetary Fund and the International Bank for Reconstruction and Develop-

ment (World Bank). At the same time, all of the countries in the region have had to come to terms with demands to alter radically their relations with the dominant industrial power in the area, South Africa.

The world's condemnation of apartheid and the brutally nondemocratic political system in South Africa has had profound effects not only on that country but also on social, political, and economic development throughout the region. Historically, the long-standing economic ties between the other countries in this region and South Africa made it difficult for those countries to attempt to sever relations with their powerful neighbour. The delegates to the first Southern African Development Coordination Conference (SADCC) in 1979 included Angola, Botswana, Mozambique, Tanzania, and Zambia. By 1980 Lesotho, Malawi, Swaziland, and the newly independent Zimbabwe had joined the group, which adopted the Lusaka Declaration at its first major regional economic summit in April of that year. An explicit aim of this declaration was to reduce the region's dependence on South Africa for transport, trade, and the supply of electric power.

Formation of SADCC

In 1986 SADCC adopted a resolution implementing economic sanctions against South Africa, but no timetable was prescribed. Moreover, several of the participating members actually increased their transport and trade links with South Africa during the late 1980s, while trade between SADCC members has remained much smaller than trade with South Africa.

The unbanning of the African National Congress (ANC) and the release of ANC leader Nelson Mandela in 1990 suggested the possibility of a resolution of major conflicts. There is now some optimism not only concerning future economic prospects within South Africa but also in the region as a whole.

Indicators of levels of development. Two widely used general development indicators—namely, the World Bank's ranking of economies from lowest to highest according to per capita income and the United Nations Development Program's ranking of countries according to the mortality of children under the age of five years—show that some of the countries in southern Africa are among the least developed in the world. South Africa and Botswana are clearly exceptions. In the early 1990s the World Bank ranked Mozambique as having the lowest per capita income in the world, while Malawi, Zambia, and Lesotho also fell into the category of "lowest income economies," with annual per capita incomes below $500 (U.S.). Angola, Swaziland, Zimbabwe, Namibia, and Botswana are categorized as "lower-middle-income economies," where income ranges between $600 and $2,400. South Africa just exceeds this level of per capita income and is the only country in the region classified as an "upper-middle-income economy." South Africa and Botswana have achieved much lower rates of under-age-five mortality than the other countries. Mozambique, Angola, and Malawi suffer from under-five mortality rates that are among the highest in the world.

These aggregate indicators of development must be treated with caution. The measurement of income is fraught with difficulties in economies where a high proportion of output is not marketed or accurately recorded, as is the case in all the economies in the region. Equally important, aggregate indicators shed no light on the crucial issue of the distribution of the benefits of growth. In South Africa, for example, the racially based historical pattern of development means that the living conditions of the majority of the population are poorly represented by the aggregate measures of income and child mortality. Nevertheless, it is important to stress that several countries in the region have achieved remarkable progress in the late 20th century with respect to some of the indicators of human welfare. All of these countries have seen a substantial improvement in life expectancy in the period since 1960. In Zimbabwe, Lesotho, and Botswana there have been dramatic changes in the number and proportion of children attending secondary schools, which will radically alter the skill composition of the labour force in the 1990s.

The regional gross national product (GNP) of the economies in southern Africa is dominated by the contribution of South Africa, which alone accounts for more than three-quarters of regional GNP; the next largest contribution to regional GNP is provided by Angola, followed by Zimbabwe and Zambia, each with only a few percent.

Population and land resources. The total estimated population for the region reached approximately 91 million by the end of the 1980s. South Africa had the largest population (in excess of 30 million), followed by Mozambique (15.3 million), Angola (9.7 million), and Zimbabwe (9.5 million). In contrast, the population was below 2 million in Namibia, Botswana, Lesotho, and Swaziland. Although rates of growth of population are generally high, they have also differed considerably between countries; these divergences are unlikely to narrow in the early 21st century.

The distribution of the population between rural and urban areas has altered dramatically in all of the countries in the region in the late 20th century. There has been a large increase in the share of the urban population. In South Africa and Zambia more than half of the population lives in urban areas, while in most of the other countries about 25 percent of the population is urban. In Malawi, which has the lowest proportion of total population living in urban areas, the share is 12 percent. Rates of urbanization have been high in all of the countries, with the urban population more than doubling between 1965 and 1990.

Increase in urban population

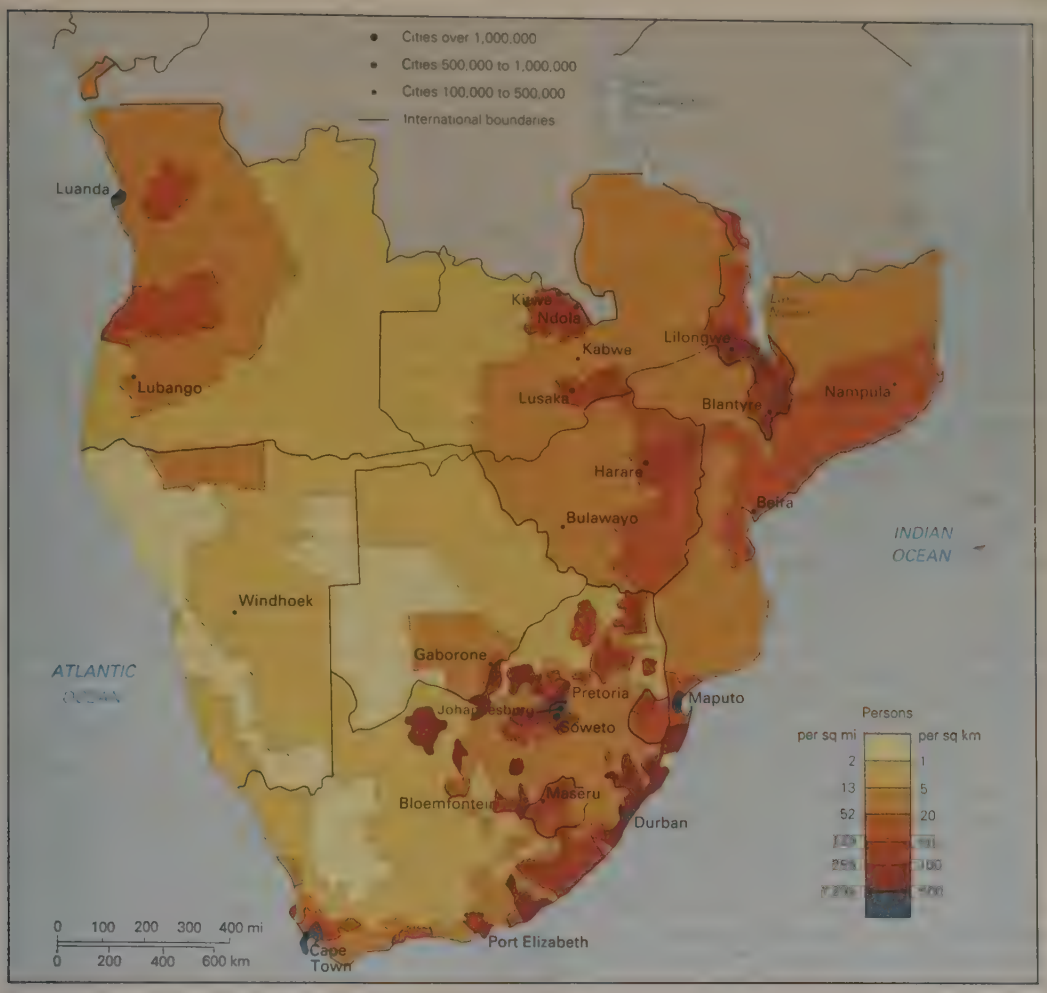
Angola and South Africa are the largest countries in the region in terms of land area; however, the proportion of each country's land that may be classified as arable differs considerably. The estimate for Angola is only 26 percent, compared to 77 percent for South Africa. In some countries the proportion of the potentially irrigable land that has been developed for irrigation is very low. For example, it is well below 10 percent in Angola, Zambia, Mozambique, and Malawi, suggesting considerable scope for increased agricultural production. In addition, these four economies, as well as Namibia, have substantial undeveloped fishing resources.

Attempts by the Food and Agriculture Organization of the United Nations to relate population density to agricultural production potential suggest that there are large differences in the degree of population pressure on land resources within the region. While Angola and Zambia clearly benefit from a large agricultural resource base relative to the size of their populations, Malawi, Lesotho, Botswana, Swaziland, and Namibia all show signs of acute pressure on available agricultural production resources. Most of the countries in the region were severely affected by drought in the early 1990s.

Many rural people can survive only by producing corn (maize), sorghum, cassava, and millet for their own consumption. A large proportion of those in the agricultural sector operate very small farms. Tenurial status on these farms and access to grazing land are often loosely defined and insecure. Yields are low and extremely variable, while access to improved inputs, such as fertilizers, pesticides, and seeds, and marketing facilities is limited. Nevertheless, throughout the region there is evidence of growing differentiation within the smallholder sector and of the growth of production for the market on the basis of wage labour as opposed to subsistence production and reliance on family labour.

In Zimbabwe, Swaziland, and South Africa much of the best land is monopolized by a few large estates, which also retain privileged access to inputs, especially credit. In Botswana, too, a freehold system dominated by large cattle ranches coexists alongside a sector characterized by small-scale producers and by forms of communal tenure. In Zambia a high proportion of marketed output and most of the land most favourably located for intensive agricultural production are controlled by a small number of farms. Although Mozambique and Angola have declared policies for the nationalization of all land and have invested in state farms as well as cooperative production structures, a high proportion of output is still produced within the smallholder sector. Privatization of state-run agricultural institutions has been an important feature of the structural adjustment and stabilization policies adopted throughout the region in the late 20th century. The success of these policies in terms of accelerated rates of growth of small-

Land holdings



Population density of southern Africa.

holder agricultural production has yet to be demonstrated, however.

The structure and growth of production. The conventional threefold division of production into agriculture, industry (including separate estimates for mining and manufacturing), and services shows that the majority of the countries in the region continue to remain reliant on the production of primary commodities. Almost 90 percent of production in Mozambique consists of raw materials, with approximately two-thirds being accounted for by the production of cotton, fish products, peanut (groundnut) oil, and sugar. Lesotho—which is predominantly a wheat producer—and Malawi—producing tea, tobacco, and sugar—also rely heavily on agriculture. Agriculture's share of the total output is high in Zambia (coffee, tobacco, and sugar) and Zimbabwe (tobacco, cotton, and sugar) as well, although in these two economies copper and other mining activities are of considerable importance. Botswana and Namibia depend to a great extent on the mining of diamonds, while South Africa (followed by Zimbabwe and Zambia) has the largest manufacturing sector in absolute and proportional terms.

Production of primary commodities

With regard to manufacturing, the only countries to have achieved substantial output by the beginning of the 1990s were South Africa, Zimbabwe, and, to a lesser extent, Zambia. While Zimbabwe's manufacturing concentrated on the processing of food, beverages, and tobacco, as well as textiles and iron ore, South Africa developed a significant manufacturing capacity in machinery and capital goods and in chemicals. The intensified threat of sanctions probably contributed to an acceleration in the growth of this capacity in South Africa in the 1970s and '80s. Not only does the manufacturing sector contribute far more to total output than is the case in the other economies in the region but the South African manufacturing sector is also much more integrated and diversified. Thus the contribution of machinery and transport equipment (20 percent) to South Africa's manufacturing value added is far larger than in other countries in the region. In Zimbabwe, with the second highest ranking, its share was below 10 percent at the beginning of the 1990s. The machinery and transport subsector barely existed in the other economies of the region.

Despite a diversified structure of production, the growth of output in the South African economy was rather low in the 1980s and early 1990s. The region as a whole has been characterized by widely diverging trends in the growth of output. Botswana has outstripped its regional neighbours, with a sustained average annual rate of growth of output in excess of 10 percent and has been one of the fastest-growing economies in the world. Lesotho and Zimbabwe have been growing by approximately 3 percent per year. South Africa has been growing at only about half this rate, and Zambia has grown even more slowly, at under 1 percent per year. Mozambique's output has declined during the same period. There does not appear to be a close relationship between the growth of output and the size of the public sector. Central government expenditure as a percentage of GNP varies widely within the region; however, in those economies that grew rapidly in the 1980s, central government expenditure accounted for a large proportion of GNP.

Major exports. Analysis of the region's major exports confirms the trends discussed above. All of the countries show a preponderance of raw materials in their export composition, in common with the majority of the economies of sub-Saharan Africa. There has been a period of decline in the demand for several types of metals and minerals from the major industrialized countries, partly as a result of the slowdown in the growth of these economies

and partly because of changes to production techniques that are less resource-intensive. Declines in demand have contributed to serious falls in the revenues from such commodities. With regard to agricultural exports, factors influencing their supply—such as unfavourable weather conditions, the persistence of wars, and the collapse of transport networks—have reduced foreign-exchange earnings. The existence of a rather diversified structure of agricultural exports, as in Mozambique, has not proved sufficient to prevent a decline of export revenues.

All the countries in southern Africa derive more than half their export earnings from raw materials. Angola, with its large deposits of petroleum, diamonds, and iron ore; Malaŵi, with its tobacco, tea, and sugar; and Zambia, with its copper, all obtain more than 90 percent of their export revenues from raw materials. South Africa and Zimbabwe derive lower proportions of their foreign-exchange earnings from the export of raw materials, reflecting the relatively developed manufacturing base in their economies and the contribution that manufactured exports make to their total exports.

Regional economic cooperation and growth. Despite SADCC's objective of reducing economic dependence on South Africa, the landlocked countries in the region still rely to a great extent on routes through South Africa for access to seaports and shipping. When SADCC was formed in 1980, approximately 80 percent of international commercial traffic from the six landlocked countries in the area went through South African ports. The evidence suggests that by 1990 approximately 60 percent of the transit from the landlocked member countries (Botswana, Lesotho, Malaŵi, Zambia, and Zimbabwe) was handled through SADCC ports. The ending of the wars fomented by the South African security forces in Angola, Mozambique, and Namibia should improve the viability of transport routes and reduce trading costs for Zambia, Botswana, Zimbabwe, and Lesotho. Following an internationally acceptable transfer of power in South Africa, the possibility of a cooperative transport agreement between SADCC members and South Africa will be a priority issue. Future trade prospects are likely to improve if the parties to such an agreement have unrestricted choices concerning transport routes.

International transportation

After the implementation of formal sanctions in the second half of the 1980s, trade with South Africa accounted for 30 percent of SADCC imports and 7 percent of exports. Zimbabwe, the dominant economy within SADCC, has remained particularly dependent on South Africa, trading far more with South Africa than with the SADCC countries. The attempts by SADCC to promote increased intra-member trade, which only amounted to 5 percent of total foreign-trade flows in the region by the end of the 1980s, may well receive less attention than the forging of new trade relationships with a democratic South Africa in the 1990s. In a new trading environment, it is possible that South Africa will play a positive role as a regional processor or beneficiation catalyst, helping to transform a range of raw-material exports into higher-value manufactured goods.

In such an environment, and with the prospects of more rapid economic growth, foreign investors would be far more likely to be positive with regard to the region as a whole. In addition, South African investors, who have considerable resources at their disposal, will be encouraged to turn their attention toward neighbouring economies. Increased integration, cooperation, and the reality of peaceful coexistence would eliminate the massive historic levels of expenditure on unproductive isolationist projects and the military. While many in the SADCC countries are now concerned about domination by the South African economy and the possibility of reductions in labour migration opportunities and the flow of remittances as a result of nationalist sentiment in a democratic South Africa, the prospect of rapidly expanding markets and capital inflows may serve to allay their pessimism.

Access to the South African labour market does, however, remain of critical importance to several economies in the region. For example, Lesotho, Mozambique, Botswana, and Swaziland were together still sending approximately a quarter of a million workers into South Africa at the beginning of the 1990s. The wages remitted by these workers are a major item in the balance of payments of many countries.

In addition, closer trading relationships with South Africa will require difficult policy decisions concerning the degree of protection to be afforded the small and insecure manufacturing sectors in neighbouring economies. Unrestricted access for manufactured imports could result in the disappearance of recently established manufacturing capacity that might, in the longer run, have proved viable and competitive. More positively, during the 1990s South Africa's neighbours will have enhanced access to a far more sophisticated industrial infrastructure and more advanced communications and information systems, as well as to African-based skilled personnel with expertise in the adaptation of agricultural and industrial technologies to the southern African environment. (J.B.S./H.Za.)

History

The history of southern Africa cannot be written as a single narrative. Shifting geographic and political boundaries and changing historiographical perspectives render this impossible. Research into local history in the last decades of the 20th century fragmented historical knowledge, and older generalizations gave way to a complex polyphony of voices, as new subfields of history—of gender and sexuality, health, and the environment to name but a few—developed. Divided societies produce divided histories, and there is hardly an episode in the region's history that is not now open to debate. In southern Africa, history is not a set of neutrally observed and agreed-upon facts: present concerns colour interpretations of even the remote past. For all the contestants in contemporary southern Africa there has been a conscious struggle to control the past in order to legitimate the present and lay claim to the future. Who is telling what history for which Africa is a question that needs constantly to be addressed.

EARLY HUMANS AND THE STONE AGE

The controversies in southern African history begin with the discovery of a fossilized hominid skull in a limestone cave at Taung near the Harts River north of Kimberley in 1924, followed from 1936 by discoveries in similar caves in the Transvaal and northern Cape. For some time the significance of these finds and their relationship to the evolution of early humans was unappreciated, perhaps because the finds could not be dated, and stone tools—long regarded the defining characteristic of early humans—had not been found with them. Since that time, similar, more datable discoveries in eastern Africa have made it possible to place the South African remains in sequence and identify them as australopithecines, upright-walking creatures who are the earliest human ancestors. The australopithecines who roamed the highland savanna plains of southern Africa date from about three to one million years ago. There can be little doubt that for hundreds of thousands of years southern Africa, like eastern Africa, was in the forefront of human development and technological innovation.

Controversies remain, however. The connections between australopithecines and earlier potentially hominid forms remain unclear, while a number of different species of australopithecine have been identified. Their evolution into the species *Homo habilis* and then into the species *Homo erectus*—which displayed the larger brain, upright posture, teeth, and hands resembling those of modern humans and from whom *Homo sapiens* almost certainly evolved—is still fiercely debated. *Homo erectus* appears to have roamed the open savanna lands of southern and eastern Africa, collecting fruits and berries—and perhaps roots—and either scavenging or hunting. Paleolithic Period (Early Stone Age) technology—known as Acheulian industry and characterized by the use of simple stone hand axes, choppers, and cleavers—seems to have spread from eastern Africa throughout the continent and also to Europe and Asia during the Middle Pleistocene Epoch, reaching southern Africa about half a million years after its first

Homo erectus

appearance in eastern Africa about 1.5 million years ago. Acheulian industry remained dominant for more than one million years.

During this time early humans also developed those social, cognitive, and linguistic traits that distinguish *Homo sapiens*. Some of the earliest fossils associated with *Homo sapiens*, dated from about 120,000 to 80,000 years ago, have been found in South Africa at the Klasies River Mouth Cave in the eastern Cape, while at Border Cave on the South Africa–Swaziland border a date of about 90,000 years ago has been claimed for similar Mesolithic Period (Middle Stone Age) skeletal remains.

With the emergence of *Homo sapiens*, experimentation and regional diversification displaced the undifferentiated Acheulian tool kit, and a far more efficient small blade, or microlithic, technology evolved. Through the controlled use of fire, denser, more mobile populations could move for the first time into heavily wooded areas and caves. Wood, bark, and leather were used for tools and clothing, while vegetable foods were also probably more important than their archaeological survival suggests.

Hunter-gatherers

Some scholars believe that the addition of organized hunting to gathering and scavenging transformed human society. The large number of distinctive Later Stone Age industries that emerged reflect increasing specialization as hunter-gatherers exploited different environments, often moving seasonally between them, and developed different subsistence strategies. As in many parts of the world, changes in technology seem to mark a shift to the consumption of smaller game, fish, invertebrates, and plants. Later Stone Age peoples used bows and arrows and a variety of snares and traps for hunting, as well as grindstones and digging sticks for gathering plant food; with hooks, barbed spears, and wicker baskets they also were able to catch fish and thus exploit rivers, lakeshores, and seacoasts more effectively.

Despite the ever-increasing number of radiocarbon dates available for the many Later Stone Age sites excavated in southern Africa, the reasons for changed consumption patterns and variations in technology are poorly understood. Nevertheless, the appearance of cave art, careful burials, and ostrich eggshell beads for adornments suggests more sophisticated behaviour and new patterns of culture. These developments apparently are associated with the emergence between 20,000 and 15,000 BC of the earliest of the historically recognizable populations of southern Africa: the Pygmy, San, and Khoi peoples.

Although many scholars attempt to deduce the nature of Later Stone Age societies by examining contemporary hunter-gatherer societies, this method is fraught with difficulties. Evidence from Botswana and Namibia suggests that many contemporary hunter-gatherers recently have been dispossessed, and that their present way of life, far from being the result of thousands of years of stagnation and isolation, has resulted from their integration into the modern world economy; this hardly provides an adequate model for reconstructions of earlier societies.

During historic times hunter-gatherers were organized in loosely knit bands, of which the family was the basic unit, although wider alliances with neighbouring bands were essential for survival. Each group had its own territory, in which special importance was attached to natural resources, and in many instances bands moved seasonally from small to large camping sites, following water, game, and vegetation. Labour was allocated by gender, with men responsible for hunting game, women for snaring small animals, collecting plant foods, and undertaking domestic chores. These patterns are also evident in the recent archaeological record, but it is unclear how far they can be safely projected back.

Contrary to the popular view that the hunter-gatherer way of life was impoverished and brutish, Later Stone Age people were highly skilled and had a good deal of leisure and a rich spiritual life, as their cave paintings and rock engravings show. Dating is problematic, but at Apollo 11 Cave in southern Namibia paintings have been dated to some 28,000 years ago. Whereas the art in the northern woodlands is stylized and schematic, that of the savanna and coastlands seems more naturalistic, showing scenes of hunting and fishing, of ritual and celebration. The motives of the artists remain obscure, but many paintings appear linked to the trance experiences of medicine men, in which the eland was a key symbol. In later rock paintings there is also the first hint of the advent of new groups of herders and farmers.

FOOD PRODUCTION

In the long run these new groups of herders and farmers transformed the hunter-gatherer way of life. Initially, however, distinctions between early pastoralists, farmers, and hunter-gatherers were not overwhelming, and in many areas they coexisted. The first evidence of pastoralism in the subcontinent occurs in the more arid west; there the bones of sheep and goats, accompanied by stone tools and pottery, date to some 2,000 years ago, about 200 years before iron-using farmers first arrived in the better-watered eastern half of the region. It is with the origins of these food-producing communities and their evolution into contemporary societies that much of the precolonial history of the subcontinent has been concerned.

When Europeans first rounded the Cape of Good Hope, they encountered herding people, whom they derogatorily called "Hottentots" but who called themselves "Khoikhoin" meaning "Men of Men." At that time Khoikhoi inhabited the fertile southwestern Cape region as well as its more arid hinterland to the northwest, where rainfall did not permit crop cultivation, but they may once have grazed their stock on the more luxuriant central grasslands of southern Africa. Linguistic evidence suggests that the languages of the later Khoikhoi (the so-called Khoe languages) originated in one of the hunter-gatherer languages of northern Botswana. In the colonial period, destitute Khoikhoi often reverted to a hunter-gatherer existence; herders and hunters were also frequently physically indistinguishable and used identical stone tools. Thus, the Dutch, and many subsequent social scientists, believed they belonged to a single population following different modes of subsistence: hunting, foraging, beachcombing, and herding. For this reason the groups are often referred to as Khoisan, a compound word referring to Khoikhoi and San, as the Khoikhoi called hunter-gatherers without livestock ("Bushmen" in the terminology of the colonists).

Khoikhoi

Most of southern Africa's early agricultural communities shared a common culture, which spread across the region remarkably quickly from the 2nd century AD. By the second half of the 1st millennium AD, farming communities were living in relatively large, semipermanent villages. They cultivated sorghum, millet, and legumes and herded sheep, goats, and some cattle; made pottery and fashioned iron tools to turn the soil and cut their crops; and engaged in long-distance trade. Salt, iron implements, pottery, and possibly copper ornaments passed from hand to hand and were traded widely. Some communities settled near exceptionally good salt, metal, or clay deposits or became known for their specialist craftsmen.

Archaeologists are divided over whether all these cultural and economic attributes arrived with a single group of new immigrants speaking a new language or resulted from a more piecemeal development of different skills and the adoption of new techniques by indigenous hunter-gatherers, as has already been suggested in the case of herding among the Khoikhoi. Moreover, archaeologists disagree about the routes and modes of dispersal as well as its timing. It seems likely, however, that a movement of immigrants into southern Africa occurred in two streams and was part of a wider expansion of populations speaking Bantu languages that ultimately derived from the Niger-Congo languages of western Africa.

Bantu speakers

"Eastern-stream" Bantu speakers, associated with the earliest farming communities in the well-watered eastern half of southern Africa, date from the 2nd to 5th century AD. Similar pottery has been found stretching from north-eastern Tanzania and coastal Kenya into eastern South Africa, Mozambique, and Swaziland. These early farmers settled on arable soils along coastal dunes, rivers, and valley basins. Where possible, they exploited marine resources, planted cereals, and worked iron, although cattle and long-distance trade were insignificant.

"Western-stream" Bantu speakers were initially more familiar with fishing, oil palms, and the cultivation of vegetables than with cereals or cattle. Even before the 1st millennium AD, pottery similar to that of the Eastern stream was being made in the upper Zambezi valley, and pottery of a slightly more recent date has been found in parts of northern Angola. It was probably from these communities that the Bantu speakers spread into the more arid western half of the subcontinent, northwestern Zambia, southwestern Zimbabwe, along the eastern margins of the Kalahari Basin into Botswana, and later into eastern South Africa and Mozambique. Like their counterparts in the east, western-stream Bantu speakers cultivated cereals, worked metal, and made pottery, but the evidence of livestock is far more clear-cut; at first they primarily raised sheep and goats, slightly later cattle.

Although at first the impact of food production was probably less momentous than is often assumed, agriculture combined with pastoralism and metallurgy could support far larger settled communities than previously had been possible and enabled a more complex social and political organization to develop. Cattle raising led to increased social stratification between rich and poor and established new divisions of labour between men and women; the accumulation of cattle and the continuous site occupation inherent in cereal production enabled the storage of wealth and the deployment of more organized political power. The relationships established among hunters, herders, and agriculturalists over more than 2,000 years of socioeconomic change ranged from total resistance to total assimilation. For the indigenous people of southern Africa the frontiers between different modes of subsistence presented new dangers and opportunities.

Social stratification

As the new culture spread, larger, more successful farming communities were established; in many areas the new way of life was adopted by the hunter-gatherers. Even in the apparently inhospitable and isolated Kalahari it is now clear that there was intense interaction and exchange between hunter-gatherers and food-producers, leading to the development of hybrid amalgams of pastoralism, agriculture, and foraging. Contemporary Bantu-speaking peoples of southern Africa are genetically very similar to the Later Stone Age people of Africa; their close relationship also is evidenced by the presence of Khoisan "click" sounds and loanwords in southeastern Bantu.

THE RISE OF MORE COMPLEX STATES

From about the turn of the 1st millennium AD, in some areas of what are now central Zambia, southeastern Zimbabwe, Malaŵi, and eastern South Africa, changes in ceramic style were paralleled by a change in the location and nature of settlements. More sophisticated techniques of ironworking, more extensive gold and copper mining, and a great increase in stone building suggest the evolution of more complex state structures, the growth of social inequalities, and the emergence of new religious and spiritual ideas. These changes were, however, neither simultaneous nor evenly spread.

The nature of these transitions and the differences among the sites are still poorly understood, and, again, archaeologists disagree as to whether the changes can be explained by local developments or by the arrival of migrating populations. In part the controversy may reflect regional differences. In most of Zambia and Malaŵi a sharply distinguishable pottery style appears at this time, probably from southeastern Zaire, and forms the basis of the ceramics made by several different societies. Farther west, however, there are greater continuities with the earlier wares, while in southeastern Africa locally driven increases in population and cattle—which led to expansion into less favourable environments but which also brought new ideas and new methods of political control—may hold the key.

Toutswe

Whatever the explanation, many of the changes appear for the first time at Toutswe in eastern Botswana with the appearance about the 7th century AD of a new ceramic tradition, new technology, and new forms of social and economic organization. There, larger, well-defended hilltop capitals probably dominated a series of smaller sites with access to water over a wide region. Toutswe may betoken the advent of a new population; on the other hand, the evidence of its large cattle herds provides insight into the way in which the natural buildup of herds in a favourable environment could stimulate social change and territorial expansion. Cattle underpinned both material and symbolic power in southern Africa and served to cement social obligations through bridewealth and loan arrangements. Cattle were also an ideal medium for exchange, and the increase in herding necessitated increased specialization and the extension of trading networks. Patrilineal and polygynous cattle-keeping farmers thus had immense advantages over communities that lacked these new forms of wealth and social organization. Similarities between Toutswe and the material culture of later sites in the Limpopo valley and Zimbabwe suggest that Toutswe also may have inspired new forms of social and economic organization for peoples further afield.

Greater stratification and more complex social organization were also probably accelerated by the growth of trading with the outside world and by competition for access to it. In the early centuries AD the northeastern African coast was well known to the traders of the Greco-Roman world. These contacts diminished with the rise of Islām, and the east coast became part of the Indian Ocean trading network. By the 8th century Arab traders had begun to visit more southerly harbours, and between the 11th and 15th centuries they founded some three dozen new towns. Although they never united politically, these towns developed a common Afro-Arabic, or Swahili, culture and a splendour that amazed the first European arrivals.

The Limpopo and Save rivers were early arteries of the trade from the southernmost Arab trading posts, with African intermediaries initially bringing ivory and perhaps animal skins, and later copper and gold, to the coast. Persian potsherds at Chibuene on the Mozambique coast in the 8th century and the presence of snapped cane glass beads as far in the interior as the Kruger National Park and at Schroda on the Limpopo, as well as in Botswana, on the Zimbabwe plateau, and as far south as the Mngeni River near Durban, all attest to the influence of this long-distance trade in the region and its early integration into the Indian Ocean networks.

At 9th- and 10th-century sites such as Schroda and Bambandyanalo in the Limpopo valley, the ivory and cattle trade seems to have been of major importance, but later Iron Age sites such as Mapungubwe (a hilltop above Bambandyanalo), Manekweni (in southwestern Mozambique), and Great Zimbabwe, which date from the late 11th to the mid-15th century, owed their prosperity to the export of gold. Farther north, the 14th-century site of Ingombe Ilede (near the Zambezi-Kafue confluence) probably also owed its prosperity in copper and gold—and its social stratification—to the rise of the east coast trade. Although they do not typify the later Iron Age as a whole, the conspicuous consumption at these sites and the bias in oral sources toward centralized states means they have attracted perhaps a disproportionate share of scholarly attention.

Mapungubwe, Manekweni, and Great Zimbabwe

In Mapungubwe and Great Zimbabwe a wealthy and privileged elite built with stone and were buried with gold and copper ornaments, exotic beads, and fine imported pottery and cloth. Their homes, diet, and ostentatious burials are in stark contrast to those of the common folk, whose dwellings cluster at the foot of the sites where they probably laboured. Large quantities of stone were brought to build walls on these hilltop sites, which suggests considerable labour. All were centres of political authority, controlling trade and cattle movement over a wide area stretching from eastern Botswana in the west to Mozambique in the east. Cattle, gold, and copper came in trade or tribute from settlements hundreds of miles away. Skilled craftsmen made elegant pottery, sculpture, and fine bone tools for local use and for trade, while the presence of spindle whorls suggests local weaving.

In the past, fierce controversy raged concerning the racial identity of Mapungubwe's occupants, and, as in the case of Great Zimbabwe, early excavators refused to accept that it could have been built by Africans. Mapungubwe's skeletal and cultural remains are, however, identical to those found at other Iron Age settlements in the subconti-

nent, and there is little reason to doubt the African origin and medieval date of both sites.

In the second half of the 15th century Great Zimbabwe came to an abrupt end. Its successor in the southwest was Torwa, with its centre at Khami; in the north it was replaced by the Mutapa state. The new culture at Khami developed both the stone-building techniques and the pottery styles found at Great Zimbabwe and seeded a number of smaller sites over a wide region of the southern and western plateau. The Torwa kingdom seems to have lasted until the end of the 17th century, when it was replaced by the Rozwi Changamire dynasty from the central plateau, which lasted well into the 19th century. The domination of the Mutapa state extended into Mozambique. Like the rulers of Great Zimbabwe, the Torwa, Mutapa, and Rozwi dynasties maintained the coastal gold and ivory trade, although cereal agriculture and cattle remained the basis of the economy.

In the first half of the 2nd millennium AD the majority of southern Africa's peoples were probably relatively unaffected by the formation of these larger trading states. Most lived in small-scale societies, based on kinship, in which political authority was exercised by a chief who claimed seniority by virtue of his royal genealogy but who may have risen to power through his access to mineral resources, hunting, or ritual skills. By 1500 most of the farming communities had stabilized in roughly their present-day habitats, reaching their ecological frontier on the dry southern Highveld of South Africa and gradually clearing the coastal forests.

Population growth

While in many areas ceramic evidence suggests cultural continuity over many centuries, within these boundaries there was considerable movement as populations expanded and found available resources inadequate. Thus, between the 17th and 19th centuries there was migration of northern and eastern Shona speakers into the centre and south of the plateau, while in South Africa new land was colonized by cattle-raising peoples, as the stone-walled sites in the southern Highveld indicate. In some areas the expansion inevitably led to conflict as the newcomers came up against settled communities; in others the indigenous inhabitants were gradually absorbed, while elsewhere sparsely inhabited, colder, and more arid mountain lands were colonized.

In most of these farming communities land was relatively plentiful, while labour was not, and control over people was therefore of the essence. Those societies in which cattle were important were patrilineal, polygynous, and virilocal; men herded, while women were the major agricultural producers. The labour and reproductive power of women was transferred from father to husband through the circulation of cattle in the form of bridewealth. Where cattle were meagre, societies were matrilineal and usually matrilocal; men still depended on women for agricultural labour and for bringing young men and children into the household. Wealthy homes were those with large numbers of women, and even before the advent of the Atlantic slave trade it had become customary for men to take slave wives who would work in exchange for protection.

By the time coastal peoples were first encountered by literate European observers in the 15th century, many were the recognizable forebears of southern Africa's contemporary population. This does not mean, however, that these societies were static and unchanging. New kingdoms and chiefdoms were formed and older ones disintegrated, the result of both internal and external agency, while new ethnic and cultural identities began to be forged in the hazardous new world resulting from Africa's incorporation into the Atlantic economy.

THE COMING OF THE PORTUGUESE

The first of these literate newcomers were the Portuguese, who from the 15th century edged their way around the African coast in the hope of outflanking Islām, finding a sea route to the riches of India, and discovering additional sources of food. They reached the kingdom of the Kongo in northwestern Angola in 1482–83; early in 1488 Bartolomeu Dias rounded the southern tip of the continent; and just over a decade later Vasco da Gama sailed along the east coast of Africa before striking out to India. Unpropitious as they were initially, these voyages marked the beginning of the integration of the subcontinent into the new world economy and the dominance of Europeans over the indigenous inhabitants.

The Portuguese in west-central Africa. Portuguese influence in west-central Africa radiated over a far wider area and was much more dramatic and destructive there than on the east coast. Initially the Portuguese crown and Jesuit missionaries forged peaceful links with the kingdom of the Kongo, converting its king to Christianity. Almost immediately, however, slave traders followed in the wake of priests and teachers, and west-central Africa became tied to the demands of the São Tomé sugar planters and the transatlantic slave trade.

The slave trade

Until 1560 the Kongo kings had an effective monopoly in west-central Africa over trade with metropolitan Portugal, which showed relatively little interest in its African possessions. By the 1520s, however, Afro-Portuguese traders and landowners from São Tomé were intervening in the affairs of the Ndongo kingdom to the south, supporting the ruler, or *ngola,* in his military campaigns and taking his war captives and surplus dependents as slaves. By the mid-16th century Ndongo, with Portuguese assistance, had become a major kingdom extending over a wide area between the Dande, Lukala, and Kwanza rivers.

By the last third of the 16th century, the Portuguese attitude toward Africa had changed; rumours of fabulous gold and silver to be found in the interior led in 1569 to the dispatch in the east of Francisco Barreto to discover the sources of gold in the Mutapa kingdom and to the appointment in 1575 of Paulo Dias de Novais to search for what turned out to be mythical silver mines in the west. Dias established himself as captain-general, or governor, in Luanda, with jurisdiction over an undefined area between the Dande and Kwanza rivers. Within a few years of his arrival the first war of a century of almost constant warfare had begun. The wars soon resolved themselves into slave-raiding campaigns, as Europeans demanded labour rather than tropical products in exchange for their merchandise, and African societies rapidly exhausted available supplies of war captives and criminals.

Chiefs exchanged slaves for European firearms and luxury goods and secured further dependents with cheaply produced textiles and fiery Brazilian alcohol. Impelled by the increased demand for slaves for the sugar plantations of São Tomé and later Brazil, and relying on African mercenaries and allies, the military governors of Luanda launched armed incursions against the people of the interior. Kingdoms rose and fell as African rulers were ineluctably drawn into the slave trade and were as often destroyed by it.

New warlords emerged at the head of bands of starving refugees, who from the late 16th until the 18th century swarmed down from the hills, fought one another, and devastated the settled kingdoms. By the end of the 16th century, well-organized military bands of marauders, known as the Imbangala, began to appear along the coast south of Luanda. In their anxiety to swell slave numbers, Portuguese governors allied with these war bands, and together they dealt the final blow to the Ndongo kingdom about 1622. By that time the Imbangala had retreated to the middle Kwango, where they founded the kingdom of Kasanje. Over the next two centuries this kingdom replaced Ndongo as the chief slave-trading entrepôt between the coast and the east, where the highly centralized and militarist Lunda kingdoms became increasingly important in supplying slaves by the 18th century.

As the Portuguese were penetrating inland from Luanda at the beginning of the 17th century, they also moved southward. In 1617 they established a colony at Benguela, which, as in the case of the Kongo kingdom, was annexed as part of Angola in the 19th century. Expansion inland from Benguela, however, like the initial expansion farther north, was spearheaded by Afro-Portuguese slave traders, who used southern ports to outflank Portuguese control. As the slave frontier moved south, so the process of constructing and then destroying slave-trading warrior kingdoms was repeated. Those who were not crushed by the process

sought safety in woodlands and swamps or joined new heterogeneous communities of refugees, like the Chokwe ("Those Who Fled") of the western savanna. These new communities often became slave-raiders themselves.

Through the 18th and early 19th centuries the slave trade remained at the centre of Angola's economic existence, with Benguela replacing Luanda as the chief port. As a result, the Ovimbundu kingdoms on the Bié Plateau, which probably were formed by refugees from the Imbangala and Mbundu kingdoms in the late 16th and 17th centuries, displaced Kasanje as the main source of slaves. The expansion of plantations in the New World doubled the numbers of slaves exported in the last third of the 18th century, when trade routes stretched as far as the Kunene River in the south and met up with the routes from Mozambique in the heart of Africa.

Impact of the slave trade

It is not possible to compile an exact balance sheet of the devastation caused to west-central Africa by the slave trade, and historians differ in their estimation of the numbers involved and of the extent of the damage inflicted. In the 17th century some 10,000 to 12,000 slaves were exported annually from Luanda. Although this figure includes captives from both north and south of the bay, it does not include those smuggled out to escape official taxation. In the 18th century about a third of the slaves exported to the Americas probably came from Angola. The figure probably represents a relatively small proportion of the total population of a huge area in any one year, but it was a significant proportion of economically active adults. The figure also does not take account of the depopulation and social dislocation resulting from incessant warfare and banditry, resulting famine and disease, and the intensification of slavery within African society.

The better-watered regions may have recouped their population losses within a couple of generations, supported by the introduction of new food crops such as manioc and corn (maize), which the Portuguese imported from South America. Nevertheless, the effects of the slave trade were, in social terms, incalculable. Accounts of Ndongo as rich and populous in the 16th century gave way to lamentations about its desolation in the 17th. The processes of border raids, wars of conquest, and civil strife, which affected the Ndongo and then the kingdoms of the Kwango River valley in the 17th century, were repeated to the south and east in the course of the 18th century as the slave frontier expanded. The ending of more overt violence as the slave frontier moved on left the weak—women, children, and the poor—vulnerable to innumerable personal acts of kidnapping and betrayal, a process exacerbated by the indebtedness of local traders to coastal merchants and the dependence of the traders on the transatlantic economy.

The Portuguese in southeastern Africa. Initially the southeastern coast was of far less concern to the Portuguese than west-central Africa. Within a few years of their arrival, however, they had seized its wealthy but divided cities and had established themselves on Moçambique and Sofala, which soon became key ports of call for ships on the way to India.

The Portuguese conquests led to the economic and cultural decline of the east coast cities. Yet the newcomers soon discovered that they were unable to control the vast area they had conquered. They faced resistance from coastal communities throughout the 16th century, and the profits they expected from the gold trade failed to materialize. In an attempt to control the trade and to discover the precious minerals for themselves, the Portuguese, following in the tracks of Muslim traders from the coast, expanded into the Zambezi valley about 1530.

Expansion into the Zambezi valley

In the Zambezi valley the Portuguese penetrated the Mutapa kingdom, with its heartland in the northeast between the Zambezi and Mazoe rivers. By the 1530s the Portuguese dominated the trade exits from the coast and had established fortresses and trade fairs along the Zambezi and on the plateau, where Africans came to exchange ivory and gold for beads and cloth. After 1541 Portuguese residents at these outposts elected representatives who were delegated certain powers by the Mwene (ruler of) Mutapa. Individual Portuguese and Goans also were able to get land grants and judicial rights from local rulers, which enabled them to extract tribute from the local population. These early grants formed the basis of what became known as the *prazo* system of landholding. Between the 17th and 19th centuries *prazeros* became immensely powerful and interfered in local African politics, creating an Afro-Portuguese society in the lower Zambezi valley independent of either African or Portuguese jurisdiction. Assisted by slave-soldiers known as the Chikunda, Afro-Portuguese warlords engaged in the slave and ivory trade, unsettling a wide area of east-central Africa.

The effect of Portuguese traders along the Zambezi valley on the Mutapa state was minimal until the late 16th century. In the 1560s, however, their hold was probably strengthened with the appearance in Zambesia of people known as the Zimba, a term applied to any marauders. These seem to have been Maravi people, who had first migrated from Luba territory to the southern end of Lake Nyasa (Lake Malaŵi) in the 14th century. There they broke up into a number of chiefdoms, usually under the paramountcy of the most powerful chief, who controlled the rain shrine at the heart of the local religion. The reasons for the Zimba irruption are far from clear, however. The Maravi attacked chiefs friendly to the Portuguese, as well as their settlements at Sena and Tete and on the coast. By 1601 the Mwene Mutapa was forced to call on the Portuguese for assistance, and this led to almost a century of increasingly disruptive Portuguese intervention in the affairs of Shona kingdoms to the south of the Zambezi.

Although attempts to drive the Portuguese from the Zambezi were unsuccessful until the late 17th century, when they were driven out by the armies of the Rozwi kingdom, this appearance of Portuguese power was deceptive: the Portuguese never had the resources to control the interior, and it was the Afro-Portuguese *prazeros* and the Rozwi Changamire dynasty who truly exploited the Mwene Mutapa's weakness.

In addition to gold, the Portuguese were interested in ivory and other mineral resources of the eastern African interior, particularly after 1700, when the gold appeared exhausted. A search for silver mines had first led them into Malaŵi in the 17th century, and from that point there is direct, though fragmentary, evidence of developments in the region. While the Portuguese records suggest that before 1590 there were no large states in the region, by the first decades of the 17th century a powerful kingdom had emerged under Muzura, perhaps out of an earlier system of small Maravi states at the southern end of Lake Nyasa.

By mid-century Muzura was eclipsed by the Kalonga, whose capital lay on the southwestern shore of Lake Nyasa, while by the turn of the 18th century the rise of the well-armed Yao in the trade between Lake Nyasa and the coast, and of the Bisa as middlemen to the west, contributed to the disintegration of the Maravi confederacy into several more or less autonomous fragments. This process was further accelerated by the wars and slave raids of the 19th century and the advent of the missionaries. By the early 18th century the Portuguese also had penetrated into present-day Zambia, establishing trading fairs at Zumbo and Feira on the Zambezi. Although there were no highly organized broker kingdoms in the area, *prazeros* traded gold and slaves to the coast.

Dutch and British competition

As in west-central Africa, from the beginning of the 17th century the Portuguese faced increasingly severe competition from Dutch and British ships in the Indian Ocean, while north of Cape Delgado the Arabs also took advantage of Portuguese weakness. In 1631 a series of revolts began on the east coast; by the beginning of the 18th century the Portuguese had been driven from the coast north of the Rovuma River. The Portuguese then turned their attention southward, where they had traded at Delagoa Bay with the local Tsonga inhabitants since the mid-16th century. They were unable to establish themselves at the bay permanently, however, and through the 18th century Dutch, English, and Austrian ships competed for the local ivory while North American whalers also traded there for food and cattle. Local chiefdoms vied for this market, and this competition contributed to the buildup of larger states in the hinterland of Delagoa Bay from the mid-18th century. Doubtless there was also trade in slaves, although

the numbers seem to have remained relatively small before the 19th century.

THE DUTCH AT THE CAPE

Apart from the Portuguese enclaves in Angola and Mozambique, the only other area of European settlement in southern Africa in the 17th and 18th centuries was the Dutch settlement at the Cape of Good Hope. In the late 16th century the Cape had become a regular port of call for the crews of European ships, who found local people ready to barter cattle in exchange for iron, copper, beads, tobacco, and brandy. By the mid-17th century Khoi intermediaries traded far into the interior. These trade relationships profoundly affected the nature of contact between the Khoikhoi and the Dutch.

In 1652 the Dutch East India Company dispatched Commander Jan van Riebeeck and 125 men to set up a refreshment station at the Cape. This outpost soon grew into a colony of settlement. In 1657 the company released a number of its servants as free burghers (citizens) in order to cultivate land and herd cattle on its behalf, and in the next year the first shiploads of slaves arrived in the colony. Although the company prohibited the enslavement of the local inhabitants, in order to protect the cattle trade, the loosely organized Khoikhoin were soon undermined by the incessant Dutch demands for their cattle and encroachment on their grazing lands and waterholes. The climate of the Cape was well suited to Europeans and their birth rate was high; whereas in Angola and Mozambique the Portuguese were ravaged by disease, at the Cape it was the indigenes who were decimated by the smallpox, influenza, and measles epidemics brought by Europeans.

Dutch expansion. By the end of the 18th century, Cape settlers—called Boers (Dutch *boer,* "farmer")—were far more numerous than their Lusophone counterparts, owing largely to natural increase. Men outnumbered women by three to two. Despite the varied European origins of the settlers, their shared vicissitudes and the company's insistence that all settlers speak Dutch and practice Calvinism led to a certain cultural uniformity and sense of group identity. The settlers began to call themselves "Afrikaners"—Africans. Nevertheless, class divisions in Cape Town and its environs were marked. A small group of affluent merchants and status-conscious company servants lived in Cape Town; in the neighbouring farming districts of the southwestern Cape, a wealthy gentry used slave labour to produce wine and wheat for passing ships. Independent small farmers eked out a living on the land, and a number of landless whites worked for others, generally as supervisors.

Trekboers

In the arid interior, economic necessity and ecology dictated a pastoral way of life for the Dutch cattle farmers, or trekboers. The poor soil and inadequate rainfall of the region necessitated vast, scattered farms, and the white population was thus thinly spread over an immense area. Although earlier literature stresses their mobility and subsistence economy, most frontier families occupied the same farms during their lifetime and remained dependent on the market for essentials such as arms and ammunition as well as for luxuries like tea, coffee, tobacco, and sugar.

The greatest barrier to Dutch expansion was the range of mountains inland from Cape Town. Once these were crossed and Khoisan resistance overcome, trekboers expanded rapidly to the east and north. The company made only sporadic attempts to follow them. Governmental authority was weak, and on the frontier trekboers were left to crush Khoisan resistance and mount their own defense through the commando system. They became accustomed to ruling over their slaves and Khoisan servants and clients as they saw fit, often with a ferocity born of fear. As the settlers expanded, their impact—through forced trade, plunder, and human and cattle disease—was increasingly destructive for the inland Khoisan, who retaliated by stealing settler cattle and burning homesteads.

The number of slaves increased along with the settler population, especially in the arable districts. Experiments in the use of indentured European labour were unsuccessful, and by the mid-18th century about half the burghers at the Cape owned at least one slave, though few owned more than 10. Slaves spoke the creolized Dutch that in the 19th century became Afrikaans. Many adopted Islām, which alarmed the ruling class. Divided in origin and dispersed geographically, slaves did not establish a cohesive culture or mount effective rebellions. Individual acts of defiance were frequent, however, and in the early 19th century there were two small uprisings. Nevertheless, in Cape Town itself slave culture provided the basis for a working-class culture after emancipation.

Slavery at the Cape is often portrayed as benign, but mortality rates were high and birth rates low; punishments for even minor misdemeanors were fierce, perhaps because adult male slaves greatly outnumbered their owners. Manumission, baptism, and intermarriage rates were also low, although newcomers and poorer burghers married slave women and, more rarely, Khoi women. Cohabitation with indigenous women was more common, especially in frontier districts where there were few white women. The children of these interracial unions, however, took on the unprivileged status of their mothers, so the practice did not affect the racially defined class structure of the society forming at the Cape. By the late 18th century in the Cape most blacks were "servants" and most Europeans were "masters."

The existence of slavery affected the status and opportunities of the dispossessed Khoisan who entered the labour market in increasing numbers from the late 17th century. Although theoretically they were free, compulsion governed the relationship between master and servant, and the legal status of the Khoisan increasingly approximated that of slaves. As the Cape became increasingly involved in the world economy, the demand for food for European ships escalated, as did calls for increased controls over Khoisan labour: in 1775 a system of "apprenticing" Khoisan children until the age of 25 was established, and by the end of the century the Khoisan were subject to a pass system similar to that which curtailed slave mobility. As they lost their cattle and grazing areas, the Khoikhoi became virtual serfs on settler farms, although some groups managed to escape beyond colonial borders.

Khoisan resistance

Khoisan resistance to Dutch colonialism erupted into guerrilla war on three occasions in the 17th century; the first, in 1659, nearly destroyed the settlement. Cattle raids punctuated almost every decade of the 18th century. The raids and counterraids became increasingly violent as the Dutch expanded into the fine sheep country to the northeast. Between 1799 and 1803 dispossessed Khoisan farmworkers in Graaff-Reinet, many with horses and guns, rose in revolt, challenging the entire colonial order. The Dutch feared that the Khoisan would attack the arable farms of the southwest, especially as they were joined by Xhosa allies. The intervention of government troops, divisions among Khoisan and Xhosa forces, and sheer bloodletting led to the defeat of the uprising, although it haunted the colonial imagination well into the 19th century. This was the last time the Khoisan fought under their traditional leaders to regain their lost lands.

The Cape's eastern frontier. For more than a century, the eastern frontier of the Cape was at the heart of the colonial encounter. Settler expansion to the east was blocked when trekboers came up against populous Xhosa farmers in the area of the Great Fish River by the 1770s. During the 18th century the Xhosa had been embroiled in two major civil wars over the chiefly succession. After both struggles, the unsuccessful contestants fled west across the Great Kei River, where they bore the brunt of the Xhosa wars against the Dutch and later the British. Various attempts to separate the colonists and the Xhosa were unavailing: in 1778, the Dutch decreed the Great Fish River as the boundary between the Xhosa and the Dutch, but Xhosa lived in the contested area to the west known as the Zuurveld, while trekboers were embedded in Xhosa territory to the east.

The establishment of the district of Graaff-Reinet in 1785 hardly improved matters. The area of magisterial jurisdiction was vast and its inhabitants unruly. Before the century was over, minor cattle raids had escalated into two frontier wars, the prelude to a struggle that lasted almost 100 years; the trekboers only expanded again after mov-

Principal peoples of southern Africa, 17th to mid-19th century.

ing north and outflanking the Xhosa. While the Dutch had superior firearms, the Xhosa had superior numbers, and both sides were internally divided. Thus, the first two frontier wars resulted in a stalemate, which ended only when the British acquired the colony permanently in the early 19th century.

By the end of the 18th century, then, when the British took over, the small Dutch East India Company outpost at the Cape had grown into a sprawling settlement in which some 22,000 whites dominated a labouring class of about 25,000 slaves and approximately as many Khoisan, as well as free blacks and "Prize Negroes"—slaves seized by the Royal Navy and reenslaved in the Cape—in Cape Town and a growing number of Xhosa in the eastern districts.

THE SLAVE AND IVORY TRADE

By the time the Cape changed hands during the Napoleonic Wars, humanitarians were vigorously campaigning against slavery, and in 1807 they succeeded in persuading Britain to abolish the trade; British antislavery ships soon patrolled the western coast of Africa. Ivory became the most important export from west-central Africa, satisfying the growing demand in Europe. The western port of Benguela was the main outlet, and the Ovimbundu and Chokwe, renowned hunters, were the major suppliers. They penetrated deep into south-central Africa, decimating the elephant populations with their firearms.

The more sparse, agricultural Ovambo peoples to the south also were drawn into the ivory trade. Initially trading in salt, copper, and iron and supplying hides and ivory to Portuguese traders, the Ovambo largely had been able to avoid the slave trade that ravaged their more populous neighbours. By the mid-19th century the advent of firearms led to a vast increase in the volume of the ivory trade, though the trade collapsed as the elephants were nearly exterminated by the 1880s. By then, traders from Angola, the Cape Colony, and Walvis Bay sought cattle as well as ivory. With the firearms acquired through the trade, Ovambo chiefs built up their power, raiding the pastoral Herero and Nama people in the vast, arid region to their south.

Neither Portugal's attempt to ban its nationals from slave trading in 1836 nor even the abolition of slavery in Brazil in the 1880s ended slavery in west-central Africa. Local merchants, chiefs, and elders turned to slaves to produce the tropical products demanded by Europeans and to serve as porters for the growing quantities of wax and ivory from the 1840s and '50s and rubber from the 1870s. Although the rubber trade was successful in the short term, excessive collection of wild rubber destroyed an irreplaceable natural resource, while new concentrations of population upset the ecological balance of a drought-prone environment.

Slave raiding in the east

British antislavery patrols drove the slave trade east, where ivory had been more significant. In the first decades of the 19th century, slave traders for the French sugar plantations in Réunion and Mauritius, who had previously drawn the majority of their slaves from Madagascar, turned their attentions to the Mozambique coast, while the demand from Cuba and Brazil also escalated. Thus, by the late 1820s Mozambique's slave exports were out-

stripping those of Angola, with demand from the French islands rivaling that of Brazil by the 1830s. The flow of slaves was augmented by turmoil in the interior of southern Africa and by slaves captured by the Chikunda soldiers of the Zambezi warlords; by the 1840s rival Zambezi armies were competing to control the trade routes to south-central Africa.

The most important area of slave raiding appears to have been in Malawi and northeastern Zambia. To the east of Lake Nyasa, the Yao—keen ivory traders from the 17th century—turned to slave raiding, obtaining firearms from the Arabs, subjugating the Chewa agriculturalists, and building up powerful polities under new commercial and military leaders. Displaced from northern Mozambique by the Ngoni in the 19th century, the Yao in turn pressured the Manganja peoples of the Shire Highlands. Although they never became large-scale slave traders, preferring instead to incorporate their captives, the Ngoni invaders added to the turmoil. While the first European observers probably exaggerated the extent of the depopulation, the political geography of the region was transformed as people moved into stockaded villages and towns and began to raid one another for captive women to work the fields while the men engaged in warfare. Vast numbers of people, especially women, were torn from their social settings, and earlier divisions based on kin came to matter less than new relationships between patron and client, protector and protected.

It was into this fluid and turbulent world that the first European missionaries to south-central Africa, inspired by the Scotsman David Livingstone, set up their Universities Mission in 1861. Although this mission ended in tragedy and failure, after Livingstone's death in 1873 other missionaries followed. In 1875 the Free Church of Scotland established the Livingstonia Mission in his memory, while the established Church of Scotland began work among the Yao at Blantyre the following year. From Lake Nyasa the Scottish missions spread inland to north-eastern Zambia and were followed by a large number of representatives of other Christian denominations in the last decades of the century. The missionaries and the Scottish-financed African Lakes Company that followed in their wake heralded the coming colonial challenge.

THE "TIME OF TURMOIL"

Given the turbulence caused by slave raiding in east- and west-central Africa, it is tempting to attribute to it also the unprecedented warfare in southern Africa in the second and third decades of the 19th century; the Mfecane, or Difaqane ("Crushing"), as this warfare is known, is currently much debated. As yet, however, there seems little evidence for extensive slave trading south of Quelimane until the 1820s, and the slave trade from Inhambane and Delagoa Bay remained paltry until 1823–44; the trade from these ports thus seems more a consequence than a cause of the wars.

Demand for cattle and ivory at Delagoa Bay seems rather more important in the emergence, by the late 18th century, of a number of larger states in the hinterland of Delagoa Bay. As in other Iron Age kingdoms, trade gave chiefs new ways of attracting followers, while elephant hunting and cattle raiding honed military organization. In the early 19th century, however, the number of European ships calling at Delagoa Bay appears to have contracted, and this may have increased competition for the cattle and ivory trade. Together with a series of devastating droughts, this competition may better account for the debilitating wars in which the larger northern Nguni chiefdoms in Zululand were embroiled by the second decade of the century. These battles occurred even before the rise of the Zulu king Shaka, whom an early historiography holds almost solely responsible for turmoil as far afield as the Cape Colony, Tanzania, and western Zambia.

Shaka

Shaka was thus the heir to, rather than the originator of, the intensified warfare in Zululand. Nevertheless, his military brilliance led to the emergence of the Zulu as the most important power in southeastern Africa. Within a few years Shaka had consolidated the numerous chiefdoms between the Tugela and Pongola rivers, although local and regional loyalties continued, and divisions within the royal family culminated in his assassination in 1828.

Initially, Shaka's most formidable rivals were the Ndwandwe, under the leadership of Zwide, who had driven Matiwane's Ngwane people onto the Highveld and Sobhuza's Ngwane north across the Pongola river, beyond the Zulu orbit. There, Sobhuza established the new conquest state of Swaziland (named for his successor, Mswati). In 1820 and again in 1823 Shaka defeated Zwide's armies, which broke into several groups. Zwide himself retired, but his generals fled northward. Clashing with one another and with the peoples in their path, the Ndwandwe (or Ngoni, as they became known) eventually established military states in northern Zimbabwe, Malawi, Zambia, and Tanzania, while the Ndwandwe general Soshangane established the extensive Gaza kingdom in south-central Mozambique. Adding greatly to the social dislocation of east-central Africa, Ngoni movements were dictated by the need to avoid more powerful African polities and to find new food resources after local cattle and crops had been exhausted through their raids. Within their military states, the Ngoni aristocracy monopolized cattle, incorporated the women and children of conquered peoples, and exacted tribute.

As in eastern Africa, where violence intersected with the intensifying activities of slave raiders, so in southern Africa the violence of this period needs to be disaggregated. Not only did warfare among the northern Ngoni precede the expansion of the Zulu kingdom; its rise does not suffice to explain the violence in the hinterland of the Cape Colony. There, the destructiveness of the settler presence was increasingly felt from the mid-18th century, as displaced groups of Khoisan and escaped slaves, carrying with them the commando system and the guns—and sometimes also the religion and the genes—of the white man, fled beyond the confines of the colony. In central and northwestern South Africa and southern Namibia these heterogenous groups of people, known variously as Basters, Griqua, Korana, Bergenaars, and Oorlams, competed for land and water with the Tswana and Nama communities and traded for or raided their ivory and cattle in the late 18th and early 19th centuries. By the 1800s the extension of the firearms frontier was disrupting the Orange River valley and intensifying conflict between the Sotho-Tswana chiefdoms beyond.

These disruptive processes were intensified when Britain occupied the Cape Colony at the turn of the 19th century. The displacement of Dutch East India Company rule by an imperial state in the early stages of its industrial revolution greatly expanded local opportunities for trade and increased demands for labour, just as the slave trade was abolished in the British empire.

This was of particular moment for the southern chiefdoms and rebellious tributaries attacked by Shaka as far as Pondoland. Many of the refugees fled either into the eastern Cape or west onto the Highveld, although their precise number is a matter of dispute. In both areas the arrival of the refugees added to upheavals of very different origin. The Mfengu, as the refugee population was known in the Cape, included in their ranks starving Xhosa victims of the 1834–35 frontier war, while the Mantatee or Fetcani (as the displaced population was known in the interior) were probably largely the product of labour raids by Griqua and Korana allies of frontier farmers.

Others shattered by the dual impact of the wars emanating from Zululand and the activities of labour raiders from the south scrambled to safety in the mountain fortresses of what is now Lesotho. There Mshweshwe, the Koena leader, built a new kingdom at Thaba Bosiu, defeating and then incorporating his main rivals through shrewd diplomatic marriages and his ability to provide them with protection. Mshweshwe quickly appreciated the utility of firearms and horses in the new warfare and of missionaries as diplomatic intermediaries.

Other dislodged Highveld peoples joined the Griqua polities along the Orange River or continued raiding along the Vaal and into the western Transvaal region, where the disorders prepared the way for the coming of Mzilikazi. Originally one of Shaka's commanders, Mzilikazi fled

Mzilikazi

from Zululand in 1823 with some 300 of his followers, known as the Ndebele (or Matabele). Over the next 15 years Mzilikazi created a 20,000-strong raiding kingdom in east-central South Africa by absorbing local Sotho-speaking peoples into his regiments. In 1837, harassed by his many enemies and defeated by expanding white farmers from the Cape Colony, Mzilikazi retreated across the Limpopo into southwestern Zimbabwe.

There, Mzilikazi established himself relatively easily, for the Shona polities were ill-prepared for the new form of warfare and were already weakened by the earlier incursions of the Ngoni and by drought. As in northeastern South Africa, the local populace was absorbed into Ndebele age-set regiments; a castelike society evolved, with the original Ngoni on top, Sotho in the middle, and Shona at the bottom. The relationships that the Ndebele established with groups beyond their immediate settlement ranged from friendly alliances to the regular exaction of tribute and random raiding. Beyond the range of Mzilikazi's armies, however, many Shona chiefdoms remained independent.

The Kololo

Yet another group dislodged by the warfare of this time, the composite Sotho group known as the Kololo, made its mark in west-central Africa. Defeated in warfare among the western Tswana, about 1840 Sebetwane led his followers across the Zambezi into northwestern Zambia. There they conquered the Lozi kingdom, which had been built up in the 18th century, and then dominated western Zambia. The Kololo triumph was short-lived, however; by 1864 the ravages of malaria, the accession of a weak and diseased king, and the revival of Lozi royal fortunes put an end to their hegemony. Nevertheless, a variant of Sotho is still the language of the region.

BRITISH OCCUPATION OF THE CAPE

During the Napoleonic Wars the Cape passed first to the British (1795–1803), then to the Batavian Republic (1803–06), and to the British again in 1806. The main impulse behind Britain's annexation was to protect its sea route to India. However, the British demands that the colony pay for its administration, produce raw materials for the metropole, and provide a market for Britain's manufactures and a home for its unemployed ineluctably drew Britain into defending the colonists, expanding their territory, and transforming the Cape's mercantile economy.

If the expansion of white settlement under the British led to a vast expropriation of African land and labour, it also led to a rapid expansion of unequal trading relations. Black-white exchange existed in the frontier zone from the early 18th century. British traders soon crossed colonial frontiers and were at Shaka's court by the early 1820s. They exchanged African cattle and crops for beads and brandy and on occasion may have purchased slaves, although even settlers well beyond colonial boundaries now disguised this as "apprenticeship" and "indenture."

Growth of missionary activity. From the end of the 18th century, European missionaries were crucial in the transformation of African society at the Cape. With Christianity came Victorian notions of "civilization" and "progress." "Progress" meant peasant production and entry into the labour market. The first converts in the Cape were the Khoisan in the east and north, and the Griqua, who by the 1820s had formed a series of independent if schismatic states in the Vaal-Orange confluence. The neighbouring Sotho-Tswana communities were also early sites of missionary activity. Two of the most famous 19th-century Scottish missionaries to southern Africa, Robert Moffat and Livingstone, worked among the Tswana. The most notable of the Tswana converts were the Ngwato, under the king Khama III (reigned 1875–1923), who established a virtual theocracy among his people, while in the eastern Cape the Mfengu were in the forefront of mission activity and peasant enterprise.

Impact of the missionaries

Initially Christianity tended to advance most rapidly among the disaffected and dispossessed, and especially among women; it was usually only after a major disaster undermined their belief systems that considerable numbers of men turned to the new religion. By inculcating individualism and encouraging the stratification that was to lead so many of their converts onto the colonial labour markets, the missionaries attacked much that was central to African society and developed an ideology to accompany colonial subordination. By the last quarter of the 19th century, missionaries and African evangelists of almost every denomination were working among the peoples of southern Africa, eroding chiefly authority and inculcating the new values and practices of the colonial world but also bringing new modes of resistance and educating many Christian Africans who later became outspoken critics of colonialism.

British development of the Cape Colony. In its constitutional development the Cape Colony followed the pattern set by Britain's other settler colonies in the 19th century. It was initially a crown colony governed by an autocratic governor, whose more extreme powers were modified by the presence in Cape Town of an articulate middle class and by the arrival in 1820 of some 5,000 British settlers. These groups demanded a free press, an independent legal system, the rooting out of corruption, and more representative institutions. After intense political struggle, Cape men were granted representative government in 1853, with a nonracial franchise that included a low property threshold, which, it was hoped, would defuse the discontent of both Afrikaners and the rebellious creolized Khoisan/Coloured population.

In 1872 the Cape gained full responsible government. The colour-blind franchise was retained but came under increasing attack. As a strategy for incorporating the more prosperous black peasants and artisans, it had been supported by white merchants, professionals, and officials. With the annexation of African territories and the creation of a mass black working class, however, it proved vulnerable, and in 1887 and 1892 the franchise qualifications were changed to restrict the number of black voters.

Initially imperial protection expanded Cape wheat and wine production, while the British did little to alter existing social and property relations. By the mid-1820s, however, imperial attempts to create a "free market" in labour—including the abolition of preferential tariffs and reform in the system of land tenure—had an explosive effect on the class relations of a colony dependent on slaves and serfs. New regulations ensured standards of treatment and established equality before the law for "masters" and "servants." Ordinance 50 of 1828, which ensured Khoisan mobility on the labour market, caused an uproar; in 1834 slaves were finally emancipated. Despite their formal equality before the law, newly emancipated slaves received only modest protection, from the handful of mission stations, against exploitative and often brutal conditions. By 1841, largely through "masters and servants" legislation, settlers had reimposed much of their old authority.

Despite the limited benefits for the underclasses, however, the British land and labour policies—together with a restructuring of local government—threatened many Afrikaners. Between 1834 and 1838, in a movement known as the Great Trek, parties of Voortrekkers ("Pioneers"), with their families and dependents, departed the Cape Colony. Their exodus was to become the central saga of 20th-century Afrikaner nationalism. Beyond the confines of the colony, they established separate republics in Natal, the Orange Free State, and the Transvaal, outflanking the Xhosa along the southeast coast, where the British were confronted by a series of interlocking crises.

The Great Trek

The first of these crises had erupted in 1799 shortly after the British first occupied the Cape. This was the third war between settlers and Xhosa in the Zuurveld and coincided with a mass uprising of Khoisan in Graaff-Reinet. Although peace was restored in 1803, the Xhosa remained in the Zuurveld until British troops drove them east of the Great Fish River in 1811–12; subsequent near-constant skirmishing again exploded into war in 1818–19, 1834–35, and 1846. For most of the century the Cape was dependent on British troops for its defense and for the further conquest of African territory.

By mid-century the western Xhosa were formidable foes, who used firearms and adopted guerrilla tactics. Thus, the eighth war (1850–53) was the most drawn-out and costly of all. As in 1799, a simultaneous uprising of Khoisan/

Coloured people at the Kat River settlement in the eastern Cape weakened the colonists' position. In the end, it was not British arms or settler prowess that defeated the Xhosa but internal tensions resulting from the activities of white traders, missionaries, and settlers. The Cape's northern frontier was now the Orange River, while in the east the land between the Great Fish and Great Kei rivers was appropriated for white settlement.

Xhosa millenarianism

In 1857 the internally divided Xhosa, exhausted by years of attrition, in the midst of severe drought and cattle disease, and undermined by the aggressive policies of the British governor Sir George Grey, turned to millenarian prophecies. They slaughtered their cattle and destroyed their crops in the belief that doing so would raise their ancestors from their graves and drive the whites into the sea. When the awaited salvation failed to materialize, some 30,000–40,000 Xhosa streamed across the frontier to seek work in the colony. An equal number died of starvation. Although Xhosa farther east fought the colonists again in 1877 and 1879, the slaughter of the cattle marked the end of Xhosa political and economic integrity. Thereafter, the annexation of the remaining African territories proceeded peacefully, if piecemeal. The last of the independent kingdoms to pass into Cape hands was Pondoland, in 1895.

THE EXPANSION OF WHITE SETTLEMENT

The Republic of Natalia and the British colony of Natal. The establishment of trekker republics in Natal and on the Highveld greatly expanded the frontiers of white settlement. The Voortrekkers, however, did not display any sense of national unity, and the parties soon fell out and set off in different directions. The trekkers enjoyed some spectacular successes as a result of their firearms, horses, and use of ox-wagons to form laagers (protected encampments), as well as strategic alliances with African chiefdoms; they found it far more difficult to establish permanent hegemony over the region.

Victory over the Zulu at the Battle of Blood River on Dec. 16, 1838, and divisions in the Zulu kingdom enabled the establishment of the short-lived Republic of Natalia, bounded to the north by the Zulu kingdom and to the south by the Mpondo. In 1843, however, the British, anxious to control the sea route to India, fearful of trekker negotiations with foreign powers, and concerned that trekker raids would spread to the eastern frontier, annexed Natal, leaving the Zulu kingdom north of the Tugela River independent until its disintegration in the civil wars that followed its defeat by the British army in 1879.

Through the 19th century, British Natal was surrounded by powerful African kingdoms and was heavily outnumbered by Africans within the colony. Constitutional development in Natal was slower and more erratic than in the Cape; colonists received responsible government only in 1893. Unlike the Cape, Natal never had a viable nonracial franchise: at the century's end few Africans had the vote despite the existence of considerable numbers of mission-educated black Christians. Racial practices in Natal—including the reservation of lands for African communal occupation, recognition of tribal authorities, codification of customary law, and control over urbanization through labour registration and influx control—were born out of the colony's weakness and provided precedents for 20th-century segregationist policies.

Racial practices in Natal

Absentee landowners bought up land claimed and vacated by the Voortrekkers and extracted rent from African producers, hoping increased white immigration would raise land prices. When in 1860 sugar was exploited successfully for the first time, indentured labour had to be brought from India to do the arduous work, because Africans—many of whom still had their own land and cattle—refused to work for the low wages offered on the plantations. By the last decades of the 19th century, however, land shortage and high taxes had forced large numbers of Africans to seek work on colonial labour markets.

Voortrekker republics in the interior. With the British annexation of Natal, most of the Voortrekkers rejoined their compatriots on the Highveld, where separate communities had been established in Transorangia and the western and northeastern Transvaal. Apart from a brief period in the mid-19th century, the British left them alone, controlling external trade and security threats through the coastal colonies. To ensconce themselves in the interior they fought major wars and established a series of accommodations with those Africans whom they were unable to conquer.

Compared to the British colonies, the racially exclusive republics between the Vaal, Hartz, and Limpopo rivers were weak outliers of the world economy, dependent on cattle ranching and hunting. Bitterly divided politically and ecclesiastically, these republics were unified in 1860 as the South African Republic, annexed as the British colony of the Transvaal between 1877 and 1881, and reconquered as the Transvaal during the South African War (1899–1902). The trekkers staked a claim to black lands, provided a framework for speculation and the beginnings of commerce, and established formal legal title to territory, though these claims were as yet barely effective. The incapacity of the settlers to wrest the indigenous inhabitants from their land resulted in the development of several types of labour coercion and control: slavery, clientship, indenture, debt bondage, and various forms of rent and labour tenancy.

The struggle to transform formal claims into actual land ownership and control continued well into the 20th century. Money was short, and government officials were paid in land, usually along with its African occupants. The settlers' accumulation of wealth was often the result of random looting and forcible, though sporadic, extraction of tribute, tempered by the limited physical capacity of the commando system. Surrounded by a horseshoe of powerful African chiefdoms, it was only in the last third of the 19th century, during a period of renewed imperial interest in the interior, that the balance of power shifted decisively in favour of white farmers.

The Orange Free State and Basutoland. Farther south, in Transorangia, a far greater proportion of the small settler community was tied to Cape and British markets through wool production. Of a population in 1875 of some 125,000, only the 26,000 whites had citizenship, but many European observers considered the Orange Free State, with its parliament and written constitution, a model republic. Despite the Dutch ancestry of the majority of the settlers, English was the language of commerce and education into the 20th century.

The existence of Mshweshwe's Basuto kingdom on the settlers' eastern flank meant constant friction. With the restoration of peace on the Highveld in the 1840s, many Africans attempted to return to their lands, only to find them occupied. Despite Mshweshwe's attempts to keep the peace, cattle raiding by his dispossessed subjects, together with increasing demands for land and labour from settler sheep-farmers, led to war in 1858 and again in 1865–69. On the first occasion, the Orange Free State was forced to sue for peace. On the second, Basutoland, internally divided and starved of arms by the British, was beaten. Some chiefs, especially in the north, offered their allegiance to the Afrikaners and, with their followers, became labour-tenants on their farms; others moved into the Transkei. In 1868, in response to repeated appeals from the Sotho, the governor of the Cape annexed Basutoland, leaving the Orange Free State in possession of the fertile Caledon River valley. In 1869 the frontiers of Basutoland were delimited, and shortly thereafter it was handed over to the Cape. In 1881, however, when the Cape government tried to disarm the Sotho, a war that the colony could not control broke out, and in 1884 Basutoland reverted to British rule.

War with Basutoland

The Orange Free State also constantly encroached on its western neighbours, the Griqua and southern Tswana states, which were also under frequent attack from the South African Republic. These attacks led to a growing alliance among the Tswana kingdoms and to protest from the missionaries and Cape traders, who feared the Afrikaners would block the main route to the interior. Nevertheless, the area came under colonial rule only after the discovery in 1867 of diamonds in Griqualand West.

Colonists in Angola and Mozambique. For much of the 19th century, Portuguese colonists in Angola and Mozam-

bique were fewer in number and weaker in authority than those in the interior of South Africa. At the beginning of the century, fewer than 1,000 settlers in each colony huddled on a number of estates around inland forts, along the Bengo and Dande rivers in Angola, and along the lower Zambezi in Mozambique. Most of them had intermarried with local peoples and were independent of Portugal. The metropolitan Portuguese were unable to control either the coastal trade or the activities of the merchants and warlords in the hinterland, who often acted in their name. Despite a mythology that held that the Portuguese, unlike the northern Europeans, did not differentiate according to race, from early times it is clear that whites had superior status and prestige—if not always greater power—in Angola and Mozambique. Although both territories gained somewhat from the Napoleonic Wars, it was not until the end of the 19th century that Portugal regained any of its colonizing energy.

Plantation agriculture

From the mid-19th century, Portuguese capital began to enter the colony and the Luanda hinterland, and planters experimented with raising coffee, cotton, cacao, and sugarcane, using the slaves who could no longer be exported. In the absence of an adequate administration or communications network, the plantations in Angola were never highly successful, although coffee cultivation spread among African peasant farmers in the region. The appropriation of African land for plantations was resisted, and Portuguese attempts to expand their colonial nucleus led to a series of wars with African peoples, followed by famine and epidemics. The instability of the last decades of the 19th century paved the way for the colonial period that followed.

Portuguese attempts to develop Mozambique met with even less success, given the lack of investment and prevailing disorder, as escaped slaves, soldiers, and porters formed bandit bands in broken country and attacked Portuguese settlements and African villages. In many areas domestic slavery underpinned the migration of young men to the labour markets of the south by the 1850s. Liberal governments in Portugal from mid-century were anxious to outlaw the feudal aspects of the *prazo* system but were unsuccessful, despite four military campaigns and a declaration in 1880 that the *prazos* were crown property.

In 1875 Portuguese rights to Delagoa Bay were recognized internationally. With the discovery of gold in the South African Republic the bay acquired a new importance as its closest outlet, and in 1888 Lourenço Marques became the capital of Mozambique.

MINERALS AND THE SCRAMBLE FOR SOUTHERN AFRICA

From the 1860s it was known that there was gold in the interior of southern Africa. In 1867 diamonds were discovered at Kimberley in Griqualand West to the north of the Cape Colony, followed shortly thereafter by discoveries of outcrop (surface) gold in the Transvaal and deep seams of gold on the Witwatersrand in 1886. The conjuncture of speculation in mining futures and land, the imposition of colonial or company rule, and an industrial revolution based on mineral extraction meant that the last third of the 19th century was one of the most traumatic in the history of the region. The language of racial domination, though hardly new, was now buttressed by social Darwinism and was particularly well-suited to an era of intensified land and labour exploitation.

Economic impact of the mineral discoveries. The mineral discoveries led to dramatic economic development. Roads, railways, and harbours were built. New coal mines were exploited. Manufacturing responded to the new markets, while the creation of an internal market for food was crucial in the commercialization of agriculture and the spread of African cash-crop production. Land prices soared, and the demand for labour became insatiable. Colonial conquest subjugated the remaining independent African societies and destroyed the bargaining power of black workers.

The diamond industry

Although most scholarly attention has focused on the gold mines, it was the diamond industry that pioneered many of the characteristics of southern Africa's labour control policies. People from all over the world came to Griqualand West to seek their fortune; between 1871 and 1875 more than 50,000 Africans from all over the subcontinent came each year, many of them lured by the prospect of purchasing firearms. Within a few years there was hardly an African chiefdom, from the Transkei to the Limpopo, that was not armed with guns, intensifying the instability of these years.

Initially, claims on the diamond fields were limited, technology was primitive, and small-scale black diggers could compete with whites. In the mid-1870s, however, chaotic production conditions, a flooded world diamond market, and labour shortages made the transition to larger units of production necessary. Joint stock companies were created, bringing international capital and a transformation of mining technology. By 1888 the thousands of claims of the previous decade had been monopolized by the De Beers Mining Company. For black and white workers the establishment of the De Beers monopoly was of immense significance. African migrant workers were now more rigorously controlled by pass laws, which limited their mobility, and by being confined to compounds for the duration of their work contracts. Many white miners lost their jobs or became overseers, and wages for all workers were sharply reduced.

The Witwatersrand

With the discovery of the Witwatersrand, attention switched from Kimberley to the South African Republic. The coastal colonies competed to control the lucrative Witwatersrand trade, and immigration mounted. When local capital proved inadequate, funds flowed in from Britain, Germany, and France. From the late 1880s gold outstripped diamonds as the region's most important export, and by 1898 the Witwatersrand produced about one-fifth of world gold output.

In 1889 the Chamber of Mines, an organization of mine owners, was formed to drive down the costs of production. This became even more important once deep-level mines were opened in the mid-1890s, because development costs were high, the ore low-grade, and the price of gold controlled. Skilled, unionized white workers from the mining frontiers of the world were able to protect their high wages, while the chamber formed two major recruiting organizations, the Witwatersrand Native Labour Association (Wenela) and the Native Recruiting Corporation, to extend, monopolize, and control the black labour supply throughout the subcontinent.

Throughout the region it was usually young men who were the first migrants, often sent by homestead heads, who tried to control their movement and their wages, or by chiefs who received a recruitment fee or a portion of the labourer's wage in tribute. For many young men, a period of labour migration could bring independent access to bridewealth. Although the process had its roots in the migration of Africans to colonial labour markets earlier in the century, migrant labour expanded after the mineral discoveries and had profound ramifications for the control of senior men over juniors and colonial administrators over taxpayers. Chiefs thus became increasingly anxious over their lack of control over young men and women and struck alliances with colonial administrators and recruiting agents to secure the return of migrants.

The scramble for southern Africa. The first move in the scramble for southern Africa came with renewed assertions of British supremacy in the interior. After much dispute, Britain annexed Griqualand West as a crown colony in 1871, transferring it to the Cape Colony in 1881. The multiple crises following the diamond discoveries led during the 1870s to failed imperial schemes to confederate the southern African territories, but imperial wars between 1878 and 1884 effectively ended the independence of the major African kingdoms. Of these conquests the best-known was the war in 1879 against the Zulu, which included a spectacular defeat of the British army at Isandhlwana; nevertheless, wars against the southern Tswana and Griqua, the Pedi of the eastern Transvaal, the western Xhosa, and the southern Sotho were the essential precondition for the creation of a unified South Africa.

The mineral discoveries whetted German imperial ambitions, and in 1884 Germany annexed the vast, sparsely populated territory of South West Africa (now Namibia).

The annexation challenged British hegemony in the region, raised fears of a German-Transvaal alliance, and accelerated the scramble for southern Africa. The possibilities of mineral wealth in the interior also revived Portugal's dream of uniting its African colonies. Portugal received short shrift from the other powers, however. At the Berlin West Africa Conference of 1884–85, Portugal secured the Cabinda exclave and a portion of the left bank of the Congo River on the Atlantic coast—considerably less than it claimed—and in 1886 the Kunene-Okavango region went to Germany. Portugal gained even less in Mozambique, which remained a narrow coastal corridor.

With the discovery of gold, the remaining independent African polities south of the Limpopo were conquered and annexed, and both within and beyond colonial frontiers concessionaires were spurred by prospects of further discoveries and the availability of speculative capital. The Limpopo constituted no barrier, and between 1889 and 1895 all the African territories south of the Congo territory were annexed. In south-central Africa the British competed with the South African Republic, Portugal, Germany, and Belgium, while in east-central Africa, to the west and south of Lake Nyasa, the thrust from the south encountered the less powerful but still significant antislavery missionary and trading frontier from the east.

Disasters of the 1890s

For many of the peoples of the subcontinent, the first phase of colonialism may have been overshadowed by the series of disasters that struck rural society in the mid-1890s, including locusts, drought, smallpox and other diseases, and a disastrous rinderpest epidemic that decimated African cattle holdings in 1896–97. Whereas before the colonial period such natural disasters would have killed large numbers in the short term but probably would have had little long-term consequence, the disasters of the 1890s drew considerable numbers of Africans into dependence on colonial labour markets for the first time and thus permanently changed the structure of African society.

The annexation of south-central Africa. From the 1860s it was known that there were "ancient gold workings" beyond the Limpopo, and by the mid-1880s Lobengula, the Ndebele king, was surrounded by concession-hunters. In 1887–88 the high commissioner at the Cape, fearful of Transvaal expansion northward, declared the region a British sphere of interest.

The story of how Cecil Rhodes came to South Africa to repair his frail health and stayed to become a millionaire on the diamond fields before he was 30 is legendary. In 1880 Rhodes entered the Cape parliament, and in the 1880s he played a key role in securing the British annexation of the Tswana kingdoms that straddled the road to the interior. One of the leading mine owners in Kimberley, by 1888 he had bought out his rivals and created the De Beers consortium. In 1890, when he became the Cape's prime minister, he was the most powerful man in southern Africa.

Rhodes hoped to find in south-central Africa a "second Rand" to outflank the South African Republic. In 1888 his agents secured exclusive mining rights from Lobengula for Rhodes' British South Africa Company (BSAC), which was granted a royal charter by the British government to exploit and extend administrative control over a vast area of southern and south-central Africa. Across the Zambezi, where the British were anxious to preempt European rivals, Rhodes engaged the newly appointed British consul for Malawi and Mozambique, Harry (later Sir Harry) Johnston, to establish his company's claims.

A flurry of treaty making in 1888–89 left BSAC with land and mineral concessions throughout present-day Malawi and Zambia. Despite the dubious legality of the treaties, the chiefs agreed to accept British jurisdiction over non-Africans in their domains and over external relations. In the European chancelleries, where the frontiers of Africa were being decided, the treaties played an important role in negotiations. In 1890–91 British, Portuguese, and German conventions established the frontiers of many of the modern states of southern Africa.

For Britain the BSAC's great advantage was its promise to make British occupation effective against contending European powers and bring capitalist development at minimum cost. In 1890 Rhodes sent a "Pioneer Column," consisting of 200 white settlers and 150 blacks, backed by 500 police, into Mashonaland; the real goal was the Ndebele kingdom, which was conquered in a deliberately provoked war in 1893. Although Matabeleland's conquest brought an anticipated boom in BSAC shares, by the end of 1894 it was clear that there was no "second Rand" in south-central Africa and that the future lay with the new deep-level mines coming into operation farther south.

As their hopes of discovering gold waned, settlers and the BSAC began expropriating African land, labour, and cattle. Settlers who participated in the war were granted lavish farms and mineral claims, both of which soon passed to speculative syndicates. A land commission perfunctorily set aside two reserves for the Ndebele on poor soils. In 1896 the Ndebele rose in revolt and were joined by a number of eastern Shona polities. Only the arrival of imperial troops and the collaboration of other Shona groups saved the company state.

These events left few resources for occupation north of the Zambezi until the late 1890s. Opposition from missionaries and the African Lakes Company ensured that the region around Lake Nyasa and the Shire River valley was separated from the BSAC sphere; it was declared the British Central African Protectorate in 1891, with Johnston as commissioner. Given the fragmentation and social divisions of the region, he found little difficulty in implementing a policy of divide and rule. Johnston's antislavery wars had the advantage of releasing labour for European employers. Wary of creating a landless proletariat, Johnston, like Rhodes, nevertheless believed that the protectorate's future development should be based on the marriage of white enterprise and black labour, assisted by Asian middlemen.

Lewanika

West of the protectorate, Africans were drawn more gradually under colonial rule, despite pleas from the Lozi king Lewanika that the British provide technical and financial assistance in exchange for mineral concessions, as promised in an 1890 treaty. Lewanika's scramble for protection in the 1890s was dictated by the same circumstances that initially had led him to invite whites into his kingdom in the mid-1880s. The 20 years following the restoration of the Lozi monarchy after the Kololo interregnum had been filled with civil war and succession disputes. By inviting the missionaries, and subsequently the BSAC, to Bulozi, Lewanika, like the Ngwato king Khama III to his south, hoped to bolster his internal position and gain the skills to enable him to deal with the intruders.

In 1897 the BSAC sent an administrator to Bulozi. Contrary to Lewanika's expectations, this spelled the end of Lozi independence. Despite Lewanika's "protected" status, over the next decade the powers of the king and the aristocracy were whittled away, and Lewanika's hopes to control the modernization of his state were not fulfilled. Bulozi became a protectorate within a protectorate, tied to the southern African political economy.

In northeastern Zambia, too, the process of imposing colonial rule came later, but in the end it was swifter and less violent than it had been to the south or east. The natural disasters of the 1890s diminished the ability of the more powerful groups to resist, while weaker peoples at first welcomed the end of Bemba, Ngoni, and Swahili exactions. A lack of resources spared the region major confrontations with colonialism: among Mpeseni's Ngoni, where gold was believed to exist, the onslaught was as dramatic as in Zimbabwe and the expropriation as brutal. Nevertheless, attempts to impose closer settlement, interfere with local agricultural techniques, and extract forced labour combined with natural disasters to produce extremely high morbidity and mortality rates in the early years of company rule.

Angola and Mozambique in the late 19th century. Although Portugal failed in its major territorial ambitions in the late 19th century, it nonetheless acquired about 800,000 square miles (2,000,000 square kilometres) of African territory, of which it controlled about one-tenth. In both Portuguese territories "pacification" became a sine qua non of economic development, and there were military campaigns or police actions in almost every year between

1875 and 1924, a measure of Portugal's weakness as a colonial power. The greatest resistance came from those people with the longest experience of Portuguese rule and with the necessary firearms.

The majority of Portuguese troops in both territories were black, a situation that turned every campaign into a potential civil war. Fragmentation of political authority, resistance of traditional elites threatened by colonial rule, and the precipitate introduction of taxes and forced labour policies also made resistance in the Portuguese colonies the most prolonged in early 20th-century Africa.

Colonial markets were of particular importance to Portugal, and tariff barriers were erected to protect its manufactures. Starved of capital and racked by financial crises, Portugal planned to develop the colonies by attracting immigration and foreign capital and by fostering plantation agriculture. In Mozambique, however, local employers could not compete with the Witwatersrand. By 1897 more than half the mineworkers on the Rand came from Mozambique, while thousands worked on South African farms.

Germans in South West Africa. The Germans were the last imperial power to arrive in Africa. Their annexation and control of South West Africa was eased by the intense cleavages that had opened up between the local Nama and the Herero chiefdoms, a result of their increasing involvement in the world economy during the 19th century.

Throughout the 19th century, displaced communities of Khoikhoi and Oorlams from the Cape had made their way into South West Africa. At first, they settled peacefully on land granted them by the local populace, some of them establishing mission communities. The advent in the 1830s of the Oorlam chief Jonker Afrikaner and his well-armed followers significantly altered the regional balance of power. Responding to an appeal from the Nama, who were being driven from their grazing lands by Herero expansion, Afrikaner settled at Windhoek. By gaining control over the all-important trade routes from Walvis Bay and the Cape Colony, he ensured Nama dominance over the Herero until his death in 1861. Wars between the Nama and Herero were exacerbated from the mid-19th century by the increasing cattle and ivory trade and the availability of firearms.

Initially Germany hoped to exploit the territory through a concession company, but it could not raise sufficient capital. The government was increasingly forced to intervene in local affairs, especially when settlers appropriated Herero cattle and grazing lands. The most formidable opponent of the Germans was Hendrik Witbooi, a Nama chief who tried unsuccessfully to unite the Herero and Nama against the Germans. After a lengthy guerrilla war, he was defeated in 1894.

The rinderpest epidemic, the alienation of the better-watered highlands, unfair trading practices, and increasing indebtedness led to an uprising by the Nama and Herero peoples in 1904–07. They were crushed in a genocidal campaign: the Herero population fell from about 70,000 to about 16,000, with many dying in the desert while

attempting to escape. The Nama were reduced by two-fifths. The handful of settlers had to turn for labour to the Cape Colony and Ovamboland, which was formally brought under colonial rule only when the South Africans took over South West Africa during World War I.

THE SOUTH AFRICAN WAR

If the Nama-Herero wars were among the most savage in colonial Africa, Britain fought an equally bitter, costly colonial war against the Afrikaner South African Republic. The reasons for the South African (or Anglo-Boer) War (1899–1902) remain controversial; some historians portray it in personal terms, the result of clashes between the president of the South African Republic, Paul Kruger, and the representatives of British imperialism, Rhodes and the high commissioner, Sir Alfred Milner; some argue that the British feared that the regional dominance of the South African Republic would open the way for German intervention in the subcontinent and endanger the sea route to India; others believe that the struggle was for supremacy over the richest gold mines in the world and the need to establish a state in the Transvaal that would fulfill the demands of the deep-level mine owners.

Even before the war, the South African Republic's inability to create and coerce a labour force was irksome to the deep-level mine owners, with their huge demand for labour and tight working costs. The liquor, railway, and dynamite policies of the South African Republic also angered the mine owners. Making use of a largely fomented clamour of British immigrants over their lack of voting rights, and secretly backed by the British colonial secretary Joseph Chamberlain, Rhodes plotted the armed overthrow of the republic by his lieutenant Leander Starr Jameson.

The Jameson Raid

The Jameson Raid in December 1895 was a complete fiasco, and the raiders were soon arrested. Rhodes was forced to resign from the premiership of the Cape Colony, and the alliance he had carefully constructed between English and Afrikaners in the Cape was destroyed. Previously loyal to the empire, Cape Afrikaners now backed Kruger against the British, as did their fellows in the Orange Free State. Nascent pan-South African Afrikaner nationalism was greatly spurred, and in 1899 a rearmed South African Republic issued an ultimatum to the British that amounted to a declaration of war. Over the next three and a half years, nearly 500,000 British troops were deployed against an Afrikaner force of 60,000 to 65,000. Some 6,000 British soldiers died in action and another 16,000 of infectious diseases. The Afrikaners lost some 14,000 in action and 26,000 in so-called concentration camps. The total number of African dead is unrecorded; according to low official estimates more than 13,000 died in the camps. In the end, the Afrikaners were forced to sue for peace, which was signed on May 31, 1902.

Even before the war ended, Milner had begun to "reconstruct" the vanquished Afrikaner republics; the most serious grievances of the mine magnates were removed, and an efficient bureaucracy was established. The smooth functioning of the mining industry was crucial both politically and economically. An acute shortage of unskilled African labour was resolved by the importation of 60,000 Chinese, despite the bitter opposition of white workers.

Africans were effectively disarmed and systematically taxed for the first time, and the pass laws were made more efficient. These changes also benefited white farmers, who were assisted in a variety of ways by the state. By 1906–07 the British were sufficiently confident of the new order they had established to grant self-governing institutions to male whites in the conquered territories, and in 1910 under the South Africa Act passed by the British parliament in 1909 the four South African colonies of Transvaal, Natal, Orange Free State, and the Cape were unified as provinces of the Union of South Africa.

The South Africa Act

SOUTHERN AFRICA, 1910–45

The nature of colonial rule. By the beginning of the 20th century the subcontinent was under European rule, and its disparate societies were increasingly meshed into a single political economy. The annexation of African territories meant the establishment of new states, and colonial rule was given perceptible effect by policemen and soldiers, administrators, tax collectors, traders, prospectors, and labour recruiters. Railroads connected the coast with the interior, opening up new markets and releasing new sources of labour. New boundaries were drawn that lasted beyond the colonial period, and the Zambezi became the frontier between the settler south and the "tropical dependencies" of East and Central Africa, although Nyasaland (Malawi) and Northern Rhodesia (Zambia) occupied a middle ground.

The exploitation of minerals, the capitalization of settler agriculture, and the establishment of manufacturing industries drew Africans into the world economy as workers and peasants, transforming class structures and political alignments and shifting the division of labour between men and women. Previously male occupations, such as hunting and warfare, declined. Indigenous production of nonagricultural commodities from cotton to iron suffered from the competition of cheap, mass-produced imports. The costs of colonialism were unequally distributed. In the areas of white colonization, the BSAC and the colonial powers supported the settlers. Elsewhere African ruling elites were able to strike compromises with their new overlords. On the reserves and protectorates of southern Africa, chiefs and hereditary headmen still controlled their following, although their authority was eroded as they became appointees of the colonial authorities.

Chiefs and headmen

Some blacks and whites were able to take advantage of economic opportunities developing in new towns and markets. Yet for the growing numbers of mission-educated Africans and Coloured and for Indian communities, the period was probably one of regression rather than advance. European racist ideology replaced an older tradition in the Cape of social dominance through economic control. Strident settler demands for urban segregation classified even wealthy Indian merchants as "uncivilized natives." Indian immigration into all the South African colonies was restricted, and in Natal a number of anti-Indian discriminatory measures followed the grant of responsible government in 1893. In the Cape, institutions became increasingly segregated.

Many Afrikaners also experienced a period of rapid change. In 1886 the South African Republic was still a preindustrial state controlled by a livestock-owning elite; by 1910 it was dominated by mining capital and formed the hub of the industrializing subcontinent. The injection of international capital, inflated land prices, the South African War, and imperial social engineering transformed Afrikaner society as painfully and perhaps more completely than African society.

Racial policies

Racially discriminatory policies were prompted by settlers' fears of competition from blacks and the growth of black class consciousness; they were given an intellectual underpinning by anthropologists and administrators fearful of rapid social change. The Portuguese espoused policies of African assimilation, yet obstacles to progress for the Afro-Portuguese and acculturated African elite were more rigidly enforced in the 20th century than they had been in the 19th. Thus, before 1945 the ideology of segregation was espoused by virtually all the governments of the region and by most whites regardless of political persuasion. For blacks segregation meant exclusion from citizenship; incorporation into a restricted and racially segmented labour market based on the use of migrant labour; government control of movement, urban residence, and trade union organization; the consolidation of the authority of the chiefs; and a recognition or invention of black ethnic identity in the African reserves.

The constitution of new colonial states and settler politics. In the new dispensation, whites, with state assistance, controlled private property and the means of production, while Africans were seen solely as labour. In South Africa after 1912 and the British colony of Southern Rhodesia (Zimbabwe) after 1923, settlers controlled the police and armed forces; elsewhere Africans manned the police and armies of the colonial state, although imperial troops remained the ultimate authority.

Divisions among whites

Settlers everywhere were united in their determination to assert white supremacy but were divided by class and

ethnicity. Particularly in South Africa, South West Africa, and Southern Rhodesia, political struggles among whites were often bitter. In South West Africa, German and Afrikaner settlers lived in uneasy tension, which increased in the 1930s when pro-Nazi demonstrations advocating a German takeover of the colony were common. In the Rhodesias, too, there was antagonism between British settlers and Afrikaners who made their way to the territory in the early years of the 20th century, as well as conflicts between the BSAC and white workers and farmers.

These political struggles were most intense in South Africa, which had the most developed economy, the largest and most diverse population (African, Indian, Coloured, and white), and the most acute class and ethnic differences. Class warfare between white workers and the mine magnates on the Rand was fierce until the 1920s. The years after the creation of the union were turbulent, with a civil war between Afrikaners when South Africa joined the British side in World War I and a series of mine strikes, which culminated in 1922 when members of the newly formed Communist Party of South Africa and recently proletarianized Afrikaners, who still dreamed of restoring their republic, joined ranks; they were defeated only after the declaration of martial law and a five-day battle between white workers and troops on the Witwatersrand that ended with 230 dead and the ringleaders hanged.

The South Africa Act of 1909 enfranchised white adult males, but, except for a diminishing proportion of black male property holders in the Cape, neither blacks nor women were enfranchised. Although white women received the vote in 1930, in 1936 Cape African men were removed from the common voters roll, and in 1956 the Coloured voters of the Cape were similarly disenfranchised. White men effectively were given control over the majority of blacks, and they retained this control until 1994.

South Africa was at the centre of Britain's southern Africa policies. Nevertheless, until the 1930s the union was poor, divided, and dominated by international capital. White settlers were Britain's closest allies. Although it overpowered its immediate neighbours, South Africa's expansionist ambitions in the region were largely blocked. Thus, in 1910 the union wished to incorporate Basutoland (now Lesotho), Bechuanaland (now Botswana), and Swaziland—three landlocked territories that had remained outside South African control. African and humanitarian opposition and Britain's desire for a foothold in the region prevented this incorporation, and the territories remained British protectorates. Until the mid-20th century, however, both Britain and South Africa assumed that the territories would ultimately become part of South Africa.

Although this did not happen, Basutoland, Bechuanaland, and Swaziland were locked into South Africa's economy. All three territories, which had been grain and cattle exporters, became increasingly dependent on the South African labour market, especially after South Africa implemented protectionist measures for white farmers. Administrators were often South African, and the form of indirect rule they practiced strengthened the authority of conservative chiefs, leaving little room for political progress.

South West Africa

The union was more successful in acquiring the vast colony of South West Africa, which it conquered from the Germans during World War I. Despite a League of Nations mandate that South West Africa be administered as a "sacred trust" for its indigenous inhabitants, South Africa's concern was to foster mining and to subsidize poor Afrikaner settlement in what was known as the "Police Zone." In 1917 Ovamboland was annexed; better-watered and therefore more densely populated, Ovamboland had long been able to resist dispossession. During the interwar years South Africa was able to defy the many resolutions passed by the League of Nations urging African social and educational advance, and the country continued to defy them even when the South African mandate was withdrawn by the United Nations in 1946.

South Africa also had designs on Southern Rhodesia. In 1922, however, when the British South Africa Company relinquished control of Southern Rhodesia, the predominantly British settlers opted for self-government under British rule, and the territory became a self-governing colony the following year. While British subjects of all races were enfranchised, high property qualifications excluded the vast majority of Africans, who formed 95 percent of the population, from voting. Between the 1920s and '50s, the governing party generally remained closely allied to the small group of mining companies that controlled the economy, while the opposition usually represented white farming and working-class interests.

In Nyasaland and Northern Rhodesia, self-government for the handful of whites was clearly impossible, although in both colonies settlers were given some representation. With the discovery of copper, the white population in Northern Rhodesia increased, but whites never achieved a political dominance comparable to that of their compatriots farther south.

Although copper mining was interrupted by the world depression of the 1930s, by the eve of World War II Northern Rhodesia was a major producer. In Nyasaland, the BSAC hoped settlers would develop the territory, but white immigration was restricted by Nyasaland's sluggish economic prospects. In both territories racially discriminatory policies protected the interests of white settlers. Nevertheless, the small numbers of whites and British proclamations of the paramountcy of African interests, differentiated these territories from those farther south.

Settlement in Mozambique and Angola

In Mozambique and Angola, too, settler numbers remained minute, despite Portugal's schemes to encourage colonial immigration. Before World War I, colonists consisted mainly of illiterate and unskilled peasants. Power remained in the hands of the governor-general, the highest colonial representative of the Portuguese government. In Angola the collapse of rubber prices in 1913 added to settler problems, and many went bankrupt; in northern Mozambique, campaigns against the Germans during World War I led to famine, forced labour, and high mortality from combat and disease. After the war, however, the colonies attracted new settlers as their economies recovered. In Angola, diamond production in the northwest was an additional stimulus for settlement.

The republican period in Portugal (1910–26) was accompanied by a flurry of activity among settler political groups, some of them in alliance with Afro-Portuguese and members of the creole elite angered by bureaucratic inefficiency and corruption. With the inauguration of Portugal's authoritarian "New State" in the early 1930s under Antônio Salazar, however, immigration schemes were dropped and strict vigilance was exercised over all political and economic activity in the colonies. Consultative institutions disappeared, and grand imperial rhetoric accompanied a return to protectionism, fostering Portugal's needs for cheap raw materials and a closed market.

Land, labour, and taxation. Everywhere in early 20th-century southern Africa the priority of administrations was for labour and revenue, and an extensive tax system was developed to address both needs: Africans' access to land determined the supply and cost of their labour, and, where land shortages did not suffice to push them into the labour market, taxation frequently did. In many areas the colonial state was weak, and colonial administrators feared rousing widespread resistance; efforts to collect taxes were often followed by flogging, hut-burning, and the confiscation of crops or cattle. Violencewas often most intense where administrations were weakest. In areas that had been under colonial rule for more extended periods, legislation forced Africans who had not already been dispossessed of their land into the labour market.

As long as Africans had access to land, however, they had some bargaining power. Money for taxes could be earned by increasing crop production or selling cattle. In many areas women did most of the farming, and young men worked periodically on white farms and in mines to earn money for cattle, fertilizer, seed, and plows. In the long run, however, Africans became locked into the money economy, and land shortage and indebtedness brought ever-increasing numbers into the labour market.

White agriculture and African reserves. At the beginning of the 20th century the vast majority of Africans in

the subcontinent still lived by farming, though in many areas they had become rent- or labour-paying tenants and sharecroppers on land claimed by settlers, syndicates, and speculators. During the 20th century these various forms of tenancy were transformed into wage labour, as white farms became increasingly capitalized.

Throughout the subcontinent, lands were reserved for sole African occupation by administrations fearful that total dispossession would lead to widespread African resistance. In South Africa, mining capitalists also came to see the utility of the reserves in subsidizing cheap labour: the limited agricultural production of the reserves supported the families of migrants, who could then be paid as single workers. On the other hand, white farmers wanted to take over the African reserves for their own use, eliminate competition from African producers, and reduce the employment status of Africans from tenancy to labour service. The Native Lands Act of 1913 and supplementary legislation in 1936 harmonized these conflicting interests, setting aside about one-eighth of South African land for 4,000,000 Africans, reserving the rest for about 1,250,000 whites.

The Native Lands Act of 1913

In Swaziland the 3,000 whites who had gained land as temporary concessions from the king in the late 19th century retained virtually two-thirds of the total in land settlements in 1908 and 1915. In response the Swazi royal family gained much popular support by establishing a national fund to repurchase the alienated lands, and by 1968 it had acquired almost half of the total. Basutoland, which had been deprived of its most fertile lands in the 19th century, was a de facto reserve although, as in Bechuanaland, land remaining in African hands was inalienable.

In Southern Rhodesia, too, where the BSAC developed commercial farming to attract immigrants and raise revenue, even the limited African reserves that had been set aside at imperial insistence were a subject of constant contention. The crucial legislation was the Land Apportionment Act of 1930, which barred African land ownership outside the reserves, except in a special freehold purchase area set aside for "progressive farmers." The best land was allocated to whites; less than one-third went to Africans. From 1937 Africans not required as labour on white-owned lands were removed to the reserves, which became increasingly congested.

Settler agriculture

Throughout the region white capitalist agriculture was possible only with extensive state support, which was not granted to Africans. The worldwide depression of the 1930s, which severely affected white farmers, intensified discrimination against African peasant production, and by the 1940s many rural areas were virtually dependent on migrant remittances.

Initially, similar policies were pursued north of the Zambezi. In Northern Rhodesia the colonial office attempted to increase settler numbers by opening the colony's best lands for white farming, while reserves were drawn up for African occupation. Although the reserves were large, like the reserves to the south, they were far from the railway line, contained poor soils, and were soon overcrowded and eroded. It was only after World War II that white land ownership was limited in Northern Rhodesia and attempts were made to address rural poverty.

In the Shire Highlands a handful of settlers owned nearly 34 million acres, while about one-eighth of all land belonged to the African Lakes Company until 1930, when it reverted to customary use. The plantations remained poor and inefficient until the 1920s and '30s, when tobacco and tea replaced coffee and cotton. Low pay, forced-labour practices, and squalid working conditions meant the plantations depended on labour tenants, sharecroppers, and migrants from Mozambique and the more marginal north.

African agriculture

South of the Shire Highlands, however, from about 1910 the administration began to encourage Africans to produce cash crops. Despite this evidence of African enterprise, however, racial bias and Nyasaland's poverty tended to handicap peasant agriculture. By the 1930s increased numbers of migrants sought work in South Africa and Rhodesia, especially after the 1913 ban on recruiting "tropical" Africans for the South African mines was lifted.

Despite South West Africa's mandatory status, Africans did not regain the land lost to the Germans; by 1946 the whites (who formed less than one-tenth of the population) controlled over three-fifths of the land in the Police Zone. Located on arid lands capable of supporting only sparse human and animal populations, the African reserves served as labour reservoirs, subject to police raids and pass laws. As settler farms on the better lands in the centre and south of the territory blocked older patterns of transhumance, independent pastoral production became difficult, and, while a few African families were able to retain their hold on rural resources, the majority were forced to seek work in town. Farther north, where the Ovambo retained control over their more fertile lands, restrictions on their access to markets meant that by the 1930s they, too, were increasingly seeking work in the colonial economy.

The invention of tribalism. In the areas reserved for sole African occupation, governments made use of African political structures, creating "tribes" where none had existed and governing through compliant indigenous chiefs and headmen. Imperial authorities at first sought to curb and undermine the powers of chiefs, whom they saw as the embodiment of their people and as potential leaders of resistance. Once the powers of the chiefs had been limited, however, fears of "detribalization" and the potential radicalization of African workers confronted administrations. In response, colonial governments throughout the region moved to bolster chiefs, granting them increased authority over their subjects while seeking to maintain their subordination to the colonial state and establishing local advisory councils as a substitute for popular enfranchisement and representation in central government. This creation of "tribal" institutions frequently created new identities and political interests.

Industrial development and increasing Westernization often made indirect rule through chiefs inappropriate to changing African needs, however. The extension of the market economy intensified divisions, especially as chiefs became identified with unpopular colonial policies and no longer had sufficient land for their commoner followers. The state recognition of chiefs, the imposition of "tribal boundaries," and land shortages meant that dissatisfied commoners could no longer check arbitrary rule by attaching themselves to alternative polities, as they had in precolonial times. Although urban migration provided some outlet, restrictions on African movement into the colonial towns, together with the often squalid living conditions and low wages, meant that moving to the towns was not an easy option.

Labour and the mining industry. At the beginning of the 20th century by far the strongest demand for labour came from the gold mines of South Africa. With the creation of the Union of South Africa there was for the first time a state strong enough to ensure the effective implementation of the laws and labour policies that had developed in Kimberley and on the Witwatersrand to control the workforce: migrant labour, compounds, revamped pass laws, and "masters and servants" legislation. The development of South Africa as the most powerful and industrialized country in modern Africa was built upon the labour of a poorly paid, mistreated, and disenfranchised workforce drawn from the entire subcontinent.

The early years of the century also saw intensified recruiting of African labour from Northern Rhodesia, Mozambique, and Nyasaland for the hundreds of small mines working scattered gold deposits in Southern Rhodesia. The difficulty of mining profitably in Southern Rhodesia meant that wages, food, housing, and health conditions were cut back ruthlessly, and mortality and morbidity rates were exceptionally high.

Across the Zambezi the absence of mineral wealth meant that Africans in Nyasaland and Northern Rhodesia migrated to the mines in Shaba (Katanga), Southern Rhodesia, and South Africa in search of money for food and taxation, although the opening up of the copper mines shifted some migrant routes to the Copperbelt. In the interwar years Northern Rhodesia and northern Nyasaland were no more than massive labour reservoirs.

In Angola and Mozambique, too, the economy was sustained by labour migration as the recruitment of labour

Migrant labour from Angola and Mozambique

for South African, Rhodesian, and German enterprises provided revenue for tax and trade. The Portuguese government attempted to control the flow of labour from Mozambique to the gold mines through a series of conventions with the Transvaal and later the Union government. Capitation fees were a major source of state income, while deferred pay ensured the migrant's return, tax payment, and purchase of Portuguese manufactures. Mozambique also benefited from a fixed proportion of the Transvaal's railway traffic. In a similar system in Angola, contract labour was sent to São Tomé; when this system was terminated as a result of allegations of slavery in 1908, the São Tomé planters also turned to Mozambique for labour.

Most Mozambican migrant labour came from the region south of the Save River; farther north, the Portuguese had granted wide mining, agricultural, and commercial concessions to chartered companies in the 1890s. Based on the old *prazos,* the chartered companies controlled more than half of the colony's lands. Under Salazar the concessions were allowed to expire, but this brought little respite. Southern Mozambique was entrenched as a labour reserve; elsewhere in the colony, as in Angola, Africans had to produce fixed quotas of cotton and rice.

The impact of migrant labour. It is difficult to determine the precise impact of migrant labour in southern Africa in the 20th century. In south-central Africa, for example, the major agricultural communities probably did not send migrants, and the majority of migrants usually came from areas already decimated by slaving and raiding. In other regions, earnings from migrant labour were often used, at least initially, to increase agricultural production, and many migrants maintained their links with the rural areas and retired there in old age. However, many Africans became dependent on the money economy and became locked into the migrant labour system; rural impoverishment resulted from the increasing congestion and soil erosion on the reserves. The division of labour in the countryside began to change, and the burden of agriculture fell increasingly on women and children.

The cheapening of black labour through migrancy rendered skilled white workers vulnerable to attempts by mineowners to reduce costs by substituting cheaper semiskilled black labour for expensive overseas workers.

The colour bar

Whites demanded a "colour bar" to protect their access to certain jobs. Initially formulated to reconcile white workers to Milner's decision to import Chinese labour, the colour bar was formally established in South Africa under the Mines and Works Act of 1911 and its amendment in 1926. At the same time industrial conciliation legislation introduced after the 1922 strike excluded blacks from the wage-bargaining machinery. These examples were followed in the Rhodesias as well, although on the Copperbelt white workers were weaker and the liberal impulse of government stronger, so that by the 1950s a skilled black workforce began to emerge there.

Urbanization and the development of secondary industry in South Africa and Rhodesia. Mining shaped southern Africa's experience of industrialization, but during the 19th century towns in the Cape and Natal engaged in small-scale manufacturing; this accelerated in response to the demands of the mining industry, although it was not until World War I that manufacturing made a significant contribution to the economy. By the end of the war the future of the mining industry seemed in doubt, while dispossessed rural Afrikaners began to enter the cities in search of work.

Although the plight of poor Afrikaners was frequently attributed to their refusal to do manual labour, they were at a double disadvantage in the towns. Unlike Africans—who had some access to the land—Afrikaners were totally dependent on their urban wage and lacked the skills of English-speaking workers. It was in response to this that the "civilized labour" policy, which favoured employers using white labour, was devised in the 1920s. The policy probably was more effective in spurring capital-intensive manufacturing and the employment of poorly paid Afrikaner women than in eliminating white poverty.

To meet the needs of Afrikaners in the cities, South Africa from 1924 promoted manufacturing through the levying of tariffs, the use of the gold tax to subsidize infrastructure development, the provision of inexpensive food to manufacturing workers, and the imposition of stringent controls to ensure low wages for black labourers. However, the insulation of South Africa's fledgling industries from international competition during the world depression and World War II may have been the most important factor in its economic expansion. Although Southern Rhodesia attempted some of the same strategies, its economy remained overshadowed by South Africa even after the establishment of the British Central African Federation in 1953. The development of manufacturing in South Africa and Southern Rhodesia led to a sharp increase in the number of urban Africans in both territories.

The African response. African peoples, who were so painfully drawn into the capitalist economy of southern Africa and were subjected to ever-increasing administrative, economic, and political control, did not acquiesce in their subordination without resistance. Most engaged in daily struggles to survive and devised individual strategies to resist exploitation. Yet they did not all experience their subjection in the same way, and to some extent this weakened resistance. The 20th century witnessed the rise of new classes, with the emergence of an African petite bourgeoisie and working class in the towns and a considerable degree of stratification in the countryside. Migrant labour both undermined and strengthened the authority of the chiefs, especially in areas where the colonial state was anxious to retain traditional structures for purposes of social control. Alongside the growth of nationalist movements among the educated elite and the organization of trade unions among workers, there was a continuation of royal family politics, a restructuring of ethnic identification, and a resort to millenarian solutions.

Royal family politics. In regions where large centralized states had existed at the time of the colonial takeover, royal politics continued to be of significance. In Barotseland, Swaziland, and Basutoland, where paramount chiefs were recognized by the British, the traditional aristocracy combined with the educated elite to protect their position and demand the redress of grievances. In both Matabeleland and Zululand, where the royal families had been militarily defeated, royalists combined to demand state recognition of the monarchy.

Political organizations and trade unions. Nonviolent African opposition to white rule—through the adoption of Western-style political organizations and the formation of trade unions—was longest and most intense south of the Limpopo, where the existence of substantial Coloured and Indian minorities gave an extra dimension to anticolonialism. In South Africa, between 1906 and 1913, Mahatma Gandhi formed the South African Indian Congress and led the first large-scale nonviolent resistance campaign against anti-Indian legislation. He gained limited success, although restrictions on Indian movement and immigration to South Africa remained in force. After his departure in 1914, however, the militancy of the Indian Congress was lost until after World War II. Nevertheless, Gandhi's example influenced later African nationalists.

The Coloureds of the Cape and Transvaal also mobilized politically in the first nationwide black political organization, the African Political Organization, founded in 1902, which sought to unite Africans in opposition to the South Africa Act of 1909. The formation of a separate Coloured Affairs Department to some extent diverted Coloured political energies from joint black action. Coloureds were prominent, however, in the All-African Convention, a body formed in 1935 that represented numerous African organizations. In 1943 the All-African Convention, along with several Coloured organizations, founded the Non-European Unity Movement, which rejected cooperation with the government and sought full democratic rights for all South Africans.

The All-African Convention

In 1912 educated Africans united various welfare associations, which had developed in the late 19th and early 20th centuries, into the South African Native National Congress (later the African National Congress [ANC]). They aimed to represent African grievances, overcome tribal divisions, and gain acceptance from whites through

self-help, education, and the accumulation of property. Demands for industrial education, individual land tenure, and representation in Parliament were accompanied by attacks on the pass laws, the colour bar, and the Native Lands Act of 1913; until the 1940s the ANC's methods remained strictly constitutional and appealed mainly to the educated elite.

The ANC had its counterparts farther to the north, partly because many early nationalists had either studied or worked in South Africa. Native associations and welfare associations evolved among the educated elite from the second decade of the 20th century and gave birth to congresses in Southern Rhodesia in 1934, Nyasaland in 1944, and Northern Rhodesia in 1948, all forerunners of more radical anticolonial movements.

Although Africans in South Africa were moving into industry by the end of World War I, their trade unions were hampered by pass laws, lack of recognition, and police harassment; strikes were illegal and often were put down with violence. Nevertheless, the period 1918–22 saw a great deal of working-class militancy, and in 1920 Clements Kadalie, a Nyasaland migrant, founded the Industrial and Commercial Workers' Union (ICU). Initially consisting of dockworkers in Cape Town, the ICU spread rapidly as a mass movement in the towns and in the countryside, where those who had been evicted responded with millenarian zeal to its message. At its height the ICU claimed 100,000 members and had branches as far afield as Southern Rhodesia and South West Africa, but by 1929 it had largely disintegrated. By that time the Communist Party of South Africa was organizing black workers. Black unions appeared elsewhere in the region after World War II.

From the early 1920s the South African government, seeking to preempt black radicalism, attempted to provide channels for the expression of African grievances through a variety of local consultative councils. In the Rhodesias and Nyasaland and, slightly later, in the smaller colonial territories, advisory councils, "tribal representatives" and rural "native authorities" played a similar role.

In Angola and Mozambique Africans had even fewer political rights, except for a brief republican period (1910–26) when political organizations, trade unions, and the press flourished. For a while it appeared that Africans and settlers in Angola would strive for similar reformist goals, but the Africans broke away to form organizations publicizing black grievances and demanding limited welfare and educational benefits. Crushed even before the advent of Salazar, these groups were revived as social and educational organizations, and it was only during the 1950s that they became overtly political.

Christianity and African popular religion. Even at their height political organizations and trade unions never reached more than a fraction of the African population, especially in rural areas. In many areas witchcraft eradication movements remained as sensitive a barometer of social distress: in 1933–34, for example, amid world depression, drought, and locusts, a cult offering adherents a medicine called *mchape* to deliver them from witchcraft swept central Nyasaland and eastern Northern Rhodesia. Antiwitchcraft cults and prophet movements drew on traditional religious and cultural beliefs, offering hope to a sorely pressed and poverty-stricken populace.

By the beginning of the 20th century, however, parts of South Africa had already experienced almost a century of Christian endeavour. The scope of mission work, already entrenched in the Shire Highlands and south of the Limpopo, was vastly extended as new societies appeared on the scene. The Roman Catholic church revived its presence in Angola and Mozambique and spread rapidly in the rest of the subcontinent. The consolidation of colonialism and the new challenges facing African society gave mission activity renewed vitality, and throughout the region black education and health remained largely the responsibility of Christian missions until after World War II.

Independent churches

At the same time, by the late 19th century many missionaries had come to oppose African religious leadership and practiced their own colour bar. Thus, many Africans turned instead to the independent churches that emerged in South Africa in the late 19th century and spread rapidly throughout the subcontinent.

African independent churches frequently stressed African political solidarity and religious autonomy and were often characterized by a millenarian vision that disturbed missionaries, settlers, and administrators. In some areas whites sought to suppress them. Although the break with a mission church betokened a desire for independence from whites, there were many motives for separatism. In Nyasaland and Northern Rhodesia, adherents of the millennial Watch Tower sect violently confronted state authority, while among the rural Shona and Kongo in Angola even the millenarian churches were more usually quietist.

The impact of World War II. Unlike World War I, World War II did not involve campaigns on southern African soil, although large numbers of black and white soldiers fought elsewhere in Africa. Yet in many ways this war had a greater impact. In South Africa manufacturing overtook mining and agriculture in its contribution to the economy, and large numbers of Africans settled in the major cities. In Southern Rhodesia, too, the war boosted the economy, and by its end tobacco farming and secondary industry had emerged as key economic sectors.

Economic expansion during the war led to increased organization among African workers, whose wages lagged far behind the rising cost of living. In South Africa these years saw a wave of African worker militancy, partly inspired by the Communist Party, and a reorganization of the African National Congress by a new younger urban constituency. The brutal suppression in 1946 of a strike by African mineworkers further radicalized many African nationalists and brought about a closer alliance between the ANC and the Communist Party.

African labour militancy

In south-central Africa, too, the end of the war brought an eruption of strikes, particularly a strike by railway workers in 1945, which led to the founding of a large number of African trade unions in Southern Rhodesia. In 1947 the British government dispatched a trade unionist to organize African mineworkers on the Copperbelt, while the first union in Nyasaland followed in 1949. With general strikes in Bulawayo and Salisbury in 1948, a new form of political action had emerged.

World War II was important in shaking up the politics of the region in other ways as well. Thousands of Africans had joined the army, and some came back home with widened horizons, while their experiences of demobilization and discriminatory compensation fueled nationalist feeling. The 1941 Atlantic Charter, which proclaimed the right of all peoples to self-determination, also stimulated political activists in southern Africa. In the 1940s the African National Congress began to demand full democratic rights in South Africa for the first time, and its influence, like that of the trade unions, began to be felt throughout the region, spread partly by returning migrant labourers.

For those territories under the authority of the British colonial office, the Colonial Development and Welfare Acts of 1940 and 1945 signaled Britain's commitment to the development of empire at a time of internal weakness. Thus, after the war Britain attempted to expand agricultural production through agricultural research stations, extension programs, promotion of technology, and conservation measures. These efforts largely benefited white estate owners rather than African peasants, however, and the attempted restructuring of peasant production prompted considerable rural unrest, providing anticolonial movements throughout the region with a large, disaffected constituency.

SOUTHERN AFRICA SINCE 1945

After the war the imperial powers were under strong international pressure to decolonize. In southern Africa, however, the transfer of power to an African majority was greatly complicated by the presence of entrenched white settlers. After an initial phase from 1945 to about 1958, in which white power seemed to be consolidated, decolonization proceeded in three stages: the relatively peaceful achievement by 1968 of independence by those territories under direct British rule; the far bloodier struggle for in-

dependence in the Portuguese colonies and in Southern Rhodesia (from 1965 Rhodesia, which achieved independence as Zimbabwe in 1980); and the denouement in South West Africa, which in 1990 achieved independence as Namibia, and South Africa, where the black majority took power after nonracial, democratic elections in 1994. While at the end of the colonial period imperial interests still controlled the economies of the region, by the end of the 20th century South Africa had become the dominant economic power. Despite the spread of multiparty democracy, violence, inequality, and poverty persisted throughout southern Africa.

The consolidation of white rule. Paradoxically, World War II and the rise of more radical African political movements initially consolidated white rule, as evidenced by the victory of the predominantly Afrikaner National Party in South Africa, the creation of the Central African Federation by Britain, and renewed white immigration to the Rhodesias, Angola, Mozambique, and South West Africa.

South Africa. Dissatisfaction with the wartime cabinet and fears of urban African militants lay behind the victory of the Reunited National Party (later the National Party [NP]), which ran on a platform of apartheid ("apartness") in the white elections of 1948. Although the NP won only a plurality of votes, its victory signified a new Afrikaner unity that resulted from 30 years of intense ideological labours and institution-building by ethnic nationalists intent on capturing the South African state.

The National Party

Although the various interests in the NP had different interpretations of apartheid, the party essentially had three connected goals: to entrench itself in power, to promote Afrikaner concerns, and to protect white supremacy. By 1970 these goals largely had been achieved. The NP controlled parliament, and many English speakers voted for the Nationalists—despite their declaration of a republic in 1960–61 and subsequent decision to remove South Africa from the British Commonwealth—believing that the NP alone ensured white domination. Economic and educational policies favoured Afrikaners, who became increasingly urbanized and less economically disadvantaged.

Under Hendrik Verwoerd, who served as minister of native affairs and later as prime minister (1958–66), apartheid took shape. Controls over African labour mobility were tightened, and the colour bar in employment was extended. From 1959 chiefly authorities in the rural reserves (renamed "Bantu homelands") were given increased powers and granted limited self-government, though they remained subject to white control. Ethnic and racial distinctions among whites, Africans, Coloureds, and Indians were more strictly defined and policed. Although Coloureds and Indians were subordinated to white rule and humiliated by racial discrimination, they nevertheless were privileged in relation to Africans.

Black opposition to apartheid policies in the 1950s was led by the ANC in alliance with other opposition organizations consisting of radical whites, Coloureds, and Indians. In 1955 this Congress Alliance drew up the Freedom Charter, a program of nonracial social democracy. Africanist suspicion of nonracialism and hostility to white Communists, however, led to the formation of the rival Pan-Africanist Congress (PAC) in 1959. Both organizations were banned after demonstrations against the pass laws in March 1960 at Sharpeville, in which police killed at least 67 and injured more than 180 African protestors, triggering massive protests. Increasingly draconian security legislation, the banning, exile, and imprisonment of leaders (including Nelson Mandela, the leader of the ANC), and the widespread use of informants resulted in a period of relative political calm in the 1960s.

The stability of the 1960s encouraged international investment, and the South African economy became far more centralized and capital-intensive. Economic growth made possible unprecedented social engineering, and the political geography of South Africa was transformed as millions of people were removed from so-called white areas to the black homelands. Access to welfare and political rights were made dependent on state-manipulated ethnic identities, which assumed new importance with the creation of the homelands. In 1976 the Transkei homeland was given "independence" by the South African government, and grants of "independence" followed over the next four years to Bophuthatswana, Ciskei, and Venda, though their "independence" was not internationally recognized.

South West Africa. In South West Africa, too, the National Party increased its control in the 1950s and '60s. Long governed as part of South Africa, in 1949 South West Africa became South Africa's fifth province, and its white population was swollen by about 3,000 immigrants. The economy grew dramatically, increasing the mobility of black workers and creating an urban-based black intelligentsia for the first time. Apartheid was extended to South West Africa, however, and in the mid-1960s its reserves were also consolidated into seven ethnically defined homelands under tribal authorities.

The small political associations in South West Africa after the war were profoundly influenced by their South African counterparts, but the first mass organization to protest against South Africa's policies was formed only in 1958; in 1960 this organization became the South West Africa People's Organization (SWAPO). Launched by Ovambo contract workers, SWAPO came to represent most black South West Africans in opposing apartheid, racial inequalities, and economic subordination to South Africa. After years of fruitless peaceful protest, SWAPO began a military campaign against the government in 1966.

SWAPO

Although South Africa did not recognize the authority of the UN, the issue of South African rule in South West Africa came before the UN regularly, and in 1966 the UN called for complete South African withdrawal. In 1973 the UN appointed its own commissioner for Namibia (as the territory became known in the 1970s); despite the presence of the UN commissioner and the intensification of SWAPO's military campaign, it was only after Angolan independence in 1975 and increasing international pressure that South Africa's policies began to change.

Angola and Mozambique. White power in Angola and Mozambique remained relatively weak in comparison to South Africa and South West Africa. After the war Portugal sought to maintain its colonies in the face of growing, if still slight, African urban nationalist movements by increasing the settler population dramatically. This was facilitated in Angola by a coffee boom and the discovery of minerals and petroleum and in Mozambique by government-instituted agricultural schemes.

These developments brought little benefit to the majority of Africans, however, who continued to work as ill-paid migrant labourers, their upward mobility blocked by settlers. Even in areas of limited fertility, Africans still had to produce their quota of cotton, rice, or coffee; most of the good land was taken over by wealthy white landowners and multinational companies, and the forced labour codes remained in operation until 1962.

Lesotho, Botswana, and Swaziland. The victory of the overtly republican National Party in South Africa challenged British interests in the subcontinent. The NP's economic policies appeared to threaten British investments in South Africa, while the Nationalists also renewed their demand for the incorporation into South Africa of Lesotho, Botswana, and Swaziland.

By the mid-1950s it was clear that the three High Commission territories could not be transferred to South Africa and had to be prepared for independence. Limited funds were made available for the provision of social services, education, soil conservation, and infrastructure development, but this assistance did little to reduce the territories' dependence on migrant labour to South Africa.

The Central African Federation. Alarm at the NP victory in South Africa also stimulated Britain into federating its south-central African territories as a bulwark against Afrikaner nationalism. Even before World War II, Northern Rhodesian whites had begun to consider federation with Southern Rhodesia as a response to growing African assertiveness, and support for federation increased after the war. At the same time, the growing importance of the copper industry in Northern Rhodesia attracted Southern Rhodesian whites to the idea of federation. It was widely assumed that Southern Rhodesia would provide managerial and administrative skills, Northern Rhodesia copper rev-

enues, and Nyasaland labour for the new entity. Africans in the north, however, feared that federation would prevent political advance and extend Southern Rhodesia's racist laws. Ignoring African opposition, in 1953 Britain's Conservative government brought the territories together in the Federation of Rhodesia and Nyasaland, commonly known as the Central African Federation.

Despite the rhetoric of multiracial partnership, the economic advantages of federation appeared mainly to benefit Southern Rhodesian whites.

Independence and beyond. The process of decolonization in south-central Africa and the High Commission territories was generally peaceful. By the late 1960s the few remaining nonindependent African countries were all in settler-dominated southern Africa. The 1970s were a time of escalating wars of liberation in Mozambique, Angola, Namibia, and Zimbabwe. The independence of the Lusophone colonies under self-proclaimed Marxist governments was crucial in shifting the balance of power against the remaining white minority states in the subcontinent. International involvement in the region increased, and by 1980 only South Africa and Namibia remained under minority rule.

For the territories of southern Africa, the continuance of apartheid in South Africa shaped the postindependence years; the liberation of these territories in turn inspired and politicized South Africa's black populace and transformed the balance of power in the region. In response, P.W. Botha, who became prime minister of South Africa in 1978 and led South Africa until 1989, massively increased defense expenditures and began a low-grade war on the neighbouring states, determined to destroy all ANC bases. South Africa destabilized the region by arming internal dissidents, who attacked schools, clinics, railways, and harbours. This intervention was especially devastating in Angola and Mozambique, but South Africa also destabilized eastern Zimbabwe and raided alleged ANC bases in Zambia, Botswana, Swaziland, and Lesotho.

Malaŵi and Zambia. By the late 1950s more militant national movements had emerged in the Central African Federation and were attempting to mobilize a disaffected peasantry in all three territories. The emergence of these nationalist movements profoundly disturbed the federal authorities. After sporadic unrest in Nyasaland in 1959 a state of emergency was declared, while in all three territories nationalist leaders were arrested and their organizations banned. The crackdown set off further disorder, and in the northern territories the British were persuaded to move toward decolonization. By 1961–62 the nationalists had been released and new constitutions drawn up, and in 1963 the federation was dissolved. In the following year the Malaŵi Congress Party under Hastings Banda and the United National Independence Party (UNIP) under Kenneth Kaunda won the first universal suffrage elections in Nyasaland and Northern Rhodesia, respectively, and led them into independence as Malaŵi and Zambia.

UNIP

In Malaŵi the unity of the nationalists was short-lived, and by the end of 1965 Banda had ruthlessly suppressed opposition activity and created a de facto one-party state. The press was muzzled, and Banda, together with an unpopular clique, controlled the party, parliament, and judiciary. In the early years of independence, Zambia also was plagued by internal divisions, although initially Kaunda handled these more circumspectly than his Malawian counterpart. Nevertheless, by 1972 Kaunda followed Banda's example and responded to political conflict and the electoral threat posed by his opponents by declaring Zambia a one-party state.

Economically, the differences between Malaŵi and Zambia were initially more striking than the similarities; Malaŵi was dependent on plantation agriculture, while Zambia depended on the export of copper. Both countries prospered in the first years after independence, but Zambia's economy declined dramatically with the collapse in the world price of copper. The weaknesses in Malaŵi's economy were only to become manifest a decade later.

Banda and Kaunda differed most, however, in their relations with the liberation struggles in the rest of southern Africa. In the hope of gaining control of northern Mozambique, Banda negotiated with the Portuguese and withheld assistance from Mozambican nationalists, who during the 1960s were beginning their military campaign. He also established close ties with the white South African government, which supplied much of Malaŵi's direct aid. Malaŵi thus became the foundation of South Africa's "outward-looking" foreign policy in Africa.

Although initially Zambia was as tied economically to Rhodesia and the Lusophone colonies, Kaunda backed the resistance movements there and supported UN sanctions against the white government in Rhodesia. He paid a heavy price. The sanctions closed Zambia's major trade and transportation routes through Rhodesia, and although alternate routes were established through Angola and new east-west lines through Tanzania were constructed by the mid-1970s, subsequent armed incursions from Rhodesia and South Africa and continued warfare in Angola and Mozambique disrupted the costly new trade and transportation lines.

By the end of the 1970s Zambia was one of the poorest countries in Africa. Poor peasants made their way to the towns, and this contributed to high levels of unemployment, social violence, and crime. Despite the end of the war in Rhodesia, which had been perceived as the main constraint on the economy, Zambia's economy deteriorated further in the 1980s. Elections were held in 1991, and the newly formed Movement for Multiparty Democracy under the leadership of the trade unionist Frederick Chiluba swept to victory.

During the late 1970s Malaŵi, long believed to have successful rural development policies, also faced economic crisis. The lean years of the 1980s saw a widening gap between rich and poor, which was worsened by Banda's support of the Mozambican insurgency movement Renamo and the influx of vast numbers of refugees from the civil war in Mozambique. By the 1990s an ailing Banda was confronted by a rising tide of popular and external pressure and was forced to allow multiparty elections, which were held in 1994 and won by the opposition United Democratic Front.

Lesotho, Botswana, and Swaziland. The independence of the majority of Britain's African territories put the independence of the High Commission territories in southern Africa on the British agenda, despite their continued economic dependence on South Africa and the relative weakness of their independence movements.

Lesotho, with high levels of literacy, was the first to organize. In 1952 Ntsu Mokhehle formed the Basutoland Congress Party, modeled on the ANC. In 1958 Chief Leabua Jonathan, who was to become Lesotho's first prime minister, founded the conservative Basutoland National Party (BNP), with the support of the South African government, the powerful Roman Catholic church, and the queen regent. Jonathan led the BNP to a narrow victory in the 1965 elections; Lesotho achieved independence in 1966. In Botswana and Swaziland, modern nationalist movements emerged somewhat later and were dominated by members of the royal families. In Botswana, which achieved its independence in 1966, Seretse Khama emerged as the first president. In Swaziland, where the presence of white settlers and South African and international economic interests held up full independence until 1968, the Swazi king Sobhuza II emerged as head of state through the overwhelming electoral majority of his Imbokodvo National Movement in the rural areas. Thus, in all three territories conservative governments anxious to avoid provoking South Africa emerged in the first elections after independence.

Jonathan and the BNP

Botswana was undoubtedly the most successful, economically and politically, and retained the most open political institutions and the most distance from South Africa. Dominated by a modernizing elite, the country's economy flourished with the expansion of cattle ranching and diamond, nickel, and copper mining. Botswana played a leading role in efforts to coordinate the regional economy. The BDP, with a primarily rural electoral base, ruled Botswana into the mid-1990s.

In Swaziland, Sobhuza II in 1973 declared a state of emergency and consolidated his rule after a more radical

opposition party showed strength in the 1972 elections. Until the death of Sobhuza II in 1982, all opposition to the government and its close links with South Africa was suppressed. In the 1980s and '90s political repression and competition for power within the ruling group intensified.

Fears that the more radical BCP would win the 1970 elections in Lesotho led Jonathan, supported by South Africa, to annul the election and suspend the constitution. Opposition leaders fled, and by the late 1970s chronic warfare had erupted in Lesotho's northeastern mountains. Through the 1960s and early '70s Jonathan was South Africa's most reliable regional ally, but he subsequently became an outspoken critic of South African policies. Jonathan's authoritarian rule continued until 1986, when he was deposed in a military coup supported by South Africa. Elections in 1993 were won by Mokhehle's BCP.

Angola and Mozambique. The longest, most divided, and bloodiest wars against colonialism in the subcontinent occurred in the Portuguese colonies. War first erupted in Angola in 1961. The initiative was captured by the urban-based Popular Liberation Movement of Angola (MPLA), under its poet-president Agostinho Neto. The MPLA was supported by communists in Portugal, the Soviet Union, and Cuba, but its hegemony was contested from the start by Holden Roberto's National Front for the Liberation of Angola (FNLA), based in Zaire, and by Jonas Savimbi's National Union for the Total Independence of Angola (UNITA), supported primarily by Ovimbundu in the south.

The MPLA and UNITA

In Mozambique the nationalist organizations were initially more successfully united. The anticolonial struggle was led by Eduardo Mondlane of the Mozambique Liberation Front (Frelimo), which was formed in 1962 by exiles in Tanzania. Internal dissent had been crushed by 1964, and Frelimo launched a guerrilla war against targets in northern Mozambique. Despite the assassination of Mondlane in 1969, a new phase of the war opened in 1971 under the leadership of Samora Machel, and by 1974 Frelimo controlled much of northern and central Mozambique.

Portugal's initial response to the outbreak of revolt in Angola and Mozambique was all-out war, and by the mid-1960s there were some 70,000 Portuguese troops in each territory. Large numbers of black troops were recruited, and villagers supporting the guerrillas were subjected to savage reprisals. In April 1974 the sheer cost of the wars—together with rising dissatisfaction with the government in Portugal—led to an army coup, the collapse of the Portuguese government, and Portuguese withdrawal from Africa.

When the Portuguese left Luanda in November 1975, Angola was in the throes of a civil war between its divided liberation movements. The war escalated as the United States aided the FNLA-UNITA alliance through Zaire and encouraged a South African invasion of Angola in 1974–75 in the hope of installing a pro-Western government. The Soviet Union supplied weapons to the MPLA, which was aided by Cuban troops. The South African invasion was repelled, but South Africa continued to destabilize the MPLA government over the next 15 years through its covert support for UNITA, which it hoped to install as its client. The MPLA eventually established control of Angola under Neto, but its government was undermined by South African incursions, the flight of most of the settlers at independence, incursions of Kongo peoples from Zaire (until 1978, when the FNLA dwindled in importance), hostility from the United States, and its own doctrinaire economic policies. By the early 1980s the MPLA had lost control over large areas in the south and southeast to UNITA.

Portuguese withdrawal also led to Mozambique's independence under a Frelimo government in June 1975, but the flight of skilled expatriates and Mozambique's proximity to hostile regimes in South Africa and Rhodesia caused immediate problems. The country was severely hit by a drastic cutback in recruitment by the South African Chamber of Mines in 1976, and, like Zambia, paid heavily for obeying UN sanctions against Rhodesia and for supporting the liberation movements. Nevertheless, in the early years of independence, Frelimo abolished many of the most hated aspects of colonial rule and greatly increased the availability of welfare resources for the black populace. Mozambican territory was raided by Rhodesia and South Africa in 1979, and this was followed by the infiltration of the Mozambican National Resistance (Renamo), a brutal insurgency group established by Rhodesian intelligence services in 1976–77.

By the late 1980s both Angola and Mozambique had jettisoned Marxist economic policies and had achieved more cordial relations with Western countries. In Angola peace accords signed in 1991 between UNITA and the MPLA roused widespread optimism, but war erupted once more when UNITA refused to accept its defeat in multiparty elections held in 1992. In Mozambique a peace accord was signed between Frelimo and Renamo in 1992; multiparty elections were held in 1994 and resulted in a victory for Frelimo. Resettlement of the more than two million Mozambicans uprooted by the conflict took place on a large scale during the mid-1990s, although the physical and psychological toll of the conflict remains incalculable.

Zimbabwe. African liberation in Rhodesia was closely tied to the independence struggles in Mozambique. The election of 1962—boycotted by African nationalists—was won by the extreme right-wing Rhodesian Front party (RF), which ran on a platform of immediate independence under white control. The Central African Federation was dissolved in 1963. Britain was unwilling to grant Rhodesia independence; in 1965 the RF, under the leadership of Ian Smith, unilaterally declared Rhodesia independent. Despite international pressure, Britain refused to use force against the illegal regime.

The banning of successive nationalist organizations and the detention and exile of their leadership led to fierce infighting and the emergence of two major liberation organizations, the Zimbabwe African National Union (ZANU), under Robert Mugabe, and the Zimbabwe African People's Union (ZAPU), under Joshua Nkomo. With Frelimo's military successes in northeastern Mozambique in 1971–72, and, more important, with the transformation of the power structure in the region after the independence of the Lusophone territories, a new guerrilla strategy began to make headway. Various attempts by the British to resolve the conflict—including a referendum on a new constitution in 1972—all failed, and by the late 1970s the Rhodesian army and the guerrillas pursued the war with increasing ferocity.

ZANU and ZAPU

By 1978 it had become clear that the Rhodesian government would not win the war, and Smith, under pressure from Western countries and South Africa, agreed in 1978 to allow the internal African opposition to contest multiracial elections the following year. These elections, however, excluded ZAPU and ZANU. Thus, despite the appointment of a black prime minister, the war continued unabated. In 1979 renewed negotiations in London ultimately led to a peace settlement that established majority rule, and in 1980 Mugabe and ZANU won a landslide electoral victory.

The release of a large number of unemployed, armed young men into the countryside bequeathed a violent legacy, and by 1982 the initial ZANU-ZAPU government coalition broke down in the face of increasing violence in Matabeleland, for which ZANU held ZAPU responsible. Early in 1983 Mugabe sent government forces to punish the people of Matabeleland. Despite the withdrawal of troops and an amnesty in 1988, memories of this brutal counterinsurgency campaign were even more traumatic than recollections of the liberation struggle.

Although the early years of Zimbabwean independence were economically promising, with the return of investment as sanctions were lifted and a series of good harvests, gross inequalities persisted. Despite its revolutionary rhetoric, ZANU (which ruled Zimbabwe into the mid-1990s) seemed more intent on replacing white government with black than with transforming the lives of the poor.

South Africa. For all the apparent success of its social engineering policies, by the late 1960s cracks had begun to appear in the National Party's edifice of control. It subsequently confronted multiple crises, as black opposition

The Black Consciousness movement

again broke to the surface with the emergence of the Black Consciousness movement in 1968, led by the charismatic activist Stephen Biko. The movement sought to raise black self-awareness and to unite black students, professionals, and intellectuals. As black political activity increased, the apparently monolithic NP began to fragment.

The economy also began to show signs of weakness by the mid-1970s. Inflation climbed steeply and the economy contracted; a reliance on imported technology contributed to a trade deficit. Whites, who constituted a declining proportion of the population, could not meet the demand for skilled and semiskilled labour. The small internal market and African trade sanctions also hampered growth.

Yet the economic growth of the 1960s had expanded the black working class and increased its confidence, and 1972–73 saw a wave of strikes and rapid growth of the trade-union movement. In some sectors the labour activism caused African wages to rise more quickly than white wages. Nevertheless, technological innovation led to high unemployment for the unskilled, and urban conditions for Africans continued to deteriorate as impoverished homeland inhabitants defied the pass laws and sought work in town. For them, the fiction of the independence of the homelands came to have a grim reality in the 1980s, as their homeland citizenship restricted their legal access to jobs and housing in the rest of South Africa.

The revival of labour activism and the independence of Mozambique and Angola further inspired the Black Consciousness movement. In June 1976 the government's determination to impose Afrikaans on black schools provided the flashpoint for prolonged countrywide protests, touched off after police fired on demonstrating students in Soweto (a black township outside Johannesburg). This event transformed political consciousness beyond the youth—although they remained in the forefront of protest thereafter—with far-reaching consequences. Churches were radicalized, large numbers of community organizations sprang up, and there was a resurgence of support for the banned ANC, particularly among young people.

In response, the government abandoned many aspects of orthodox apartheid: African trade unions were recognized, the pass laws were abolished, and attempts were made to co-opt the African middle and skilled working class (through the granting of limited urban and welfare rights) and to enhance the status of Indians and Coloureds (through constitutional change).

The reform process had stalled by the mid-1980s, and the state attempted to undermine black opposition by cultivating conservative African leaders, notably Chief Mangosuthu Buthelezi, head of the primarily Zulu Inkatha movement in Natal, which became the scene of internecine violence. When F.W. de Klerk ascended to the presidency in 1989, he faced continuing African militancy, international economic and cultural sanctions, renewed economic recession, and intensifying war in Angola and Namibia.

On Feb. 2, 1990, de Klerk announced his intention to free Nelson Mandela, lift the ban on many opposition parties (including the ANC and the PAC), and negotiate with the black majority for a new, nonracial constitution. Agreement on an interim constitution was reached in 1993, and in April 1994 Mandela was elected president of South Africa.

Nonracial constitution

Namibia. The independence of Angola prompted changes in South African strategy toward Namibia during the late 1970s, as South Africa attempted to transform the territory into a quasi-independent buffer against more radical change by proposing complex constitutional arrangements for a transitional government. The strategy, based on the co-option of a local black elite as a moderate alternative to SWAPO, was intended to placate international opinion while leaving control of Namibia in South African hands and keeping its military options open. The constitutional proposals were rejected by the international community, however, and in 1978 the UN Security Council passed Resolution 435, which set out proposals for a cease-fire and UN-supervised elections. South Africa did not move to implement this resolution, though it had accepted similar proposals earlier.

By the second half of the 1980s—in part because South Africa once more had been drawn into invading Angola—the war in Namibia was becoming increasingly costly for South Africa in military, political, economic, and diplomatic terms. Under joint pressure from the Soviet Union and the United States, South Africa finally agreed to implement Resolution 435, and democratic elections in 1989 were won by SWAPO, led by Sam Nujoma. In 1990 Namibia finally achieved independence.

Problems facing southern Africa. Despite the achievement of independence, the countries of southern Africa remained embedded in a regional economy consisting of enclaves of high capital investment and rural areas of increasing impoverishment. The new governments inherited authoritarian and often quite rudimentary states from the colonial regimes and had little experience of governing. Many countries faced the problem of creating a nation out of nationalism: the anticolonial movements had been led by a small, middle-class elite, mobilizing a largely peasant populace, and, with the transfer of power, older social, economic, and ethnic cleavages opened. These conflicts, though often described as resulting from age-old ethnic tensions, were as much the result of relatively recent historical patterns of regional differentiation. In many of the countries, particularly Angola and Zimbabwe, the legacy of the independence struggles was itself divisive.

Civil society—trade unions, civic associations, the judicial system—was frail throughout most of southern Africa, while in several countries the nationalization of major industries increased the power and patronage of a small bureaucratic elite. One-party states—whether nominally Marxist, as in the case of Angola, Mozambique, and Zimbabwe, or capitalist, as in the case of Malaŵi, Lesotho, and Swaziland—quickly emerged and paid scant regard to civil liberties. Disregard for the rights of the peasantry lay behind much of the tension in Mozambique and Angola, while in Zimbabwe land redistribution was hampered, and peasants and women who had been mobilized during the war became disillusioned.

In most countries the early years of independence were marked by advances in education and welfare, a major method by which postindependence governments secured popular support and distanced themselves from their colonial predecessors. Within a short time, however, the new governments began to falter. Declining world prices for raw materials undermined many southern African economies, while limited resources, a narrow tax base, and the cost of social programs contributed to high levels of indebtedness. The urban bias of policy makers, together with demographic growth and several years of drought, bedeviled most attempts at rural development.

Economic decline

After the first few years of independence much of the region experienced a decline in economic growth and a reduction in living standards. Even South Africa, the economic giant of the region, saw a dramatic drop in the standard of living and high levels of unemployment. Through the 1980s the International Monetary Fund and the World Bank imposed policies of structural adjustment with little positive effect, although the agencies forced the cutback of state welfare programs throughout the region.

Economic difficulties in the region were greatly increased by the continuance of liberation struggles, which imposed painful choices on the region: governments of countries that had won independence had to walk a tightrope between their natural sympathies for other nationalist movements and the danger that they would attract the ire of the more powerful settler societies. The majority of states did attempt, where possible, to support the liberation movements while protecting their own interests.

South Africa dominated the regional economy, accounting for about four-fifths of the value of the region's production in the early 1990s. The most important transport links and power lines ran from north to south, the major electronic media were based in South Africa, and the country continued to draw migrant labour from the region. Attempts by surrounding states to break South Africa's dominance through the formation of regional development organizations were only partly successful.

The end of the Cold War intensified the demand both internally and from the international community for polit-

ical change in southern Africa. The heightened interest in political reform was a major factor in the achievement of independence by Namibia, the end of apartheid in South Africa, the resolution of the conflict in Mozambique and attempts to end the civil war in Angola, and the conversion to multiparty rule in south-central Africa.

The 1990s thus seemed to hold the promise of a more hopeful future. These hopes, however, were extraordinarily fragile. Global economic restructuring, fluctuations in Western economies, and low commodity prices marginalized many of the countries of the region, while indebtedness and structural adjustment policies exacerbated internal tensions. Some two million people had been rendered homeless by the Angolan civil war, and the AIDS epidemic raged virtually unchecked, with infection rates soaring in some countries. The region was awash with weapons, haunted by the horrors of war, and bedeviled by intense poverty. Huge inequalities of wealth, dwindling resources, rapid population growth, high rates of illiteracy and disease, and political and ethnic divisions continued to plague southern Africa. The newly dominant ideology of market economics offered stark choices and little hope, while democracy remained extremely delicate. (Sh.M.)

THE COUNTRIES OF SOUTHERN AFRICA

Angola

Angola is a country of southwestern Africa. Roughly square in shape, with a maximum width of about 800 miles (1,300 kilometres), Angola covers 481,354 square miles (1,246,700 square kilometres), including the Cabinda exclave, which is located along the Atlantic coast just north of the Angola-Congo (Kinshasa) border. Angola is bordered to the far northwest by Congo (Brazzaville), to the north and northeast by Congo (Kinshasa), to the southeast by Zambia, to the south by Namibia, and to the west by the Atlantic Ocean. There are 1,025 miles of coast, and the land frontiers total 3,023 miles. The capital is Luanda.

Angola is one of the largest oil producers in sub-Saharan Africa, and it is the largest of the Portuguese-speaking African states. Portuguese influences have been felt for some 500 years, but Angola acquired its present boundaries only in 1891. An anticolonial struggle from 1961 to independence in 1975 was followed by a continuing civil war that has left much of the country in ruins.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* From a narrow coastal plain, the land rises abruptly to the east in a series of escarpments to rugged highlands, which then slope down toward the centre of the continent. The coastal plain varies in width from about 125 miles in the area south of Luanda to about 15 miles in the Benguela region. The Bié (Angolan) Plateau to the east of Benguela forms a rough quadrilateral of land above the 5,000-foot (1,500-metre) mark, culminating at about 8,600 feet and covering about one-tenth of the country's surface. The Malanje highlands in the north-central part of the country are less extensive and lower in elevation, while the Huíla Plateau in the south is smaller still but rises steeply to an elevation of some 7,700 feet. The almost featureless plateau that covers the eastern two-thirds of Angola gradually falls away to between 1,650 and 3,300 feet at the eastern border. The highest point in the country is Mount Môco, near the city of Huambo, which reaches an elevation of 8,596 feet (2,620 metres).

Gerald Cubitt—Bruce Coleman Ltd.

Bedrock and laterite formations visible in the eroded landscape south of Luanda, in the subplateau region of Angola.

Drainage. The Lunda Divide forms a watershed on the plateau, separating north- and south-flowing rivers. In the northeast, rivers such as the Kwango (Cuango) flow out of Angola into the mighty Congo River, which forms the boundary between Angola and Congo (Kinshasa) for the final 90 miles of its course. The central part of the plateau is drained by the Kwanza (Cuanza), the largest river entirely within Angola's frontiers, which is about 620 miles in length. It runs for roughly half its length in a northerly direction before bending westward through a break in the escarpment between the Malanje highlands and Bié Plateau, and it flows into the sea about 40 miles south of Luanda. The southwestern part of the country is drained by the Kunene (Cunene) River, which heads south before turning west and breaking through the escarpment at the Ruacana Falls, after which it marks the boundary between Angola and Namibia to the Atlantic Ocean. Some rivers in the southeast of the plateau flow into the Zambezi River, which itself crosses the Kazombo salient in the far east of the country. Other rivers in this area feed the Okavango Swamp in Botswana. Small rivers in the south run into the internal drainage system of the Etosha Pan in Namibia, while others, often seasonal in nature, drain the steep western slopes of the escarpment.

Soils. The coastal plain consists of alluvia, chalk, and sand, underlain by oil-bearing formations occurring over the northern two-thirds. Crystalline bedrock of Precambrian age (*i.e.*, between about 570 million and 3.8 billion years old) emerges along the escarpment, and mineral deposits sometimes lie close to the surface. Much erosion has occurred in this area, and laterite formations are common. Most of the plateau in the eastern two-thirds of the country lies buried under deep deposits of infertile wind-blown Kalahari sands. River gravels of the northeast contain diamonds, and rare kimberlite pipes occur in this area.

Climate. Angola has a tropical climate with a marked dry season. The climate is largely affected by the seasonal movements of the rain-bearing intertropical convergence zone (ITCZ), the northward flow of the cold Benguela Current off the coast, and elevation. Rainfall is the key determinant of climatic differentiation, and it decreases rapidly from north to south and in proximity to the coast. The Maiombe forest in the Cabinda exclave receives the greatest amount of rainfall, about 70 inches (1,800 millimetres) per year, and Huambo, on the Bié Plateau, receives roughly 55 to 60 inches. In contrast, Luanda, on the dry coast, receives about 13 inches, while the far south of the coastal plain gets as little as 2 inches. The rainy sea-

Rainfall patterns

son lasts from September to May in the north and from December to March in the south. Droughts frequently afflict the country, especially in the south. Temperatures vary much less than rainfall. They generally decrease with distance from the Equator, proximity to the Benguela Current, and increasing altitude. The average annual temperature in Soyo, for example, at the mouth of the Congo, is 79° F (26° C), whereas in Huambo, on the Bié Plateau, it is 67° F (19° C).

Plant and animal life. When the Portuguese first arrived, parts of Angola were covered with dense rain forest, mainly in the north of the Cabinda exclave, the western edge of the Malanje highlands, the northwestern corner of the Bié Plateau, and along some rivers in the northeast. Much of this forest has been greatly diminished by agriculture and logging. Most of Angola's surface is covered with different kinds of savanna (grasslands with scattered trees), ranging from savanna-forest mosaic in the north to thorn scrub in parts of the south. Savanna vegetation is frequently accompanied by natural or man-made fires, and tree species are thus usually resistant to fire. True desert is confined to the Namib in the far southwest, which extends north from Namibia and is the home of a unique plant, the tumboa (*Weltwitschia mirabilis*), which has a deep taproot and two broad, flat leaves about 10 feet long that lie along the desert floor.

The fauna is typical of the savanna lands of Africa. The carnivores include leopards, lions, and hyenas, while the plant-eating animals are represented chiefly by elephants, hippopotamuses, giraffes, zebras, buffaloes, wildebeest, and different kinds of antelopes and monkeys. The land is rich in bird species and has a wide variety of reptiles, including crocodiles. The numerous insects include mosquitoes and tsetse flies. There are 13 national parks and nature reserves, but checks on hunting largely broke down with the spread of civil war. The giant sable antelope (*Hippotragus niger variani*) is found in the south and is particularly vulnerable. Other endangered species are the gorillas and chimpanzees of the Maiombe forest, the black rhinoceros, and the Angolan giraffe. Marine life is particularly rich in the south, because of the favourable effects of the cold Benguela Current, and it includes many species of temperate-water coastal fish.

Settlement patterns. The rural population is heavily concentrated in the highlands and along watercourses running off the highlands. The Bié Plateau alone contains about half the total rural population. In the north and centre of the country people live in villages, whereas in the south, where cattle keeping is important, there is a tradition of dispersed settlement and transhumance in search of pastures. A few !Kung live as nomads in remote areas of the far south. Decades of warfare have led to much enforced settlement in large villages.

Rural settlement

Urbanization stood at about 15 percent at the end of the colonial period, and it accelerated under the impact of civil war. More than one million people live in the capital city of Luanda, the major port and one of the oldest towns in sub-Saharan Africa. Farther south along the coastal plain, the historic town of Benguela and the port and industrial centre of Lobito are traditional rivals, while Namibe (Moçâmedes) is the port for the south and the country's largest fishing centre. Other important northern cities are Malanje at the eastern end of the Luanda Railway, and the coastal oil towns of Cabinda and Soyo (Santo António do Zaïre). Huambo (Nova Lisboa) is the regional capital of the Bié Plateau, and it is surrounded by a scattering of smaller towns, while Lubango (Sá da Bandeira) dominates the Huíla highlands.

The people. *Ethnic and linguistic composition.* Apart from a few Europeans and isolated bands of !Kung in the remote southeast, all Angolans belong to the Bantu linguistic family, which is found throughout central, eastern, and southern Africa. The largest ethnolinguistic group is the Ovimbundu, who speak Umbundu and who account for nearly two-fifths of the population. They inhabit the Bié Plateau, have migrated to Benguela and Lobito and areas along the Benguela Railway to the west and east, and live in fairly large numbers in Luanda. The next largest ethnic group is the Mbundu (or Akwambundu), who speak Kimbundu and who make up one-fourth of the population. They dominate the capital city and the Malanje highlands and are well represented in most coastal towns. Speaking Kikongo, the Bakongo in the far north are the third group. They account for about 15 percent of the population and are numerous in Luanda. Many Kikongo speakers are also found in neighbouring parts of Zaire and Congo. Lunda, Chokwe, and Ngangela peoples live scattered through the thinly populated eastern part of the country, spilling over into Zaire and Zambia. The Ovambo and Herero peoples in the southwest also live in Namibia, while the closely related Nyaneka-Nkhumbi people are confined to Angola.

Portuguese is the official language. It has become fairly widely spoken since independence, replacing Kimbundu as the lingua franca of Luanda, and it is understood in much of the country. English and Afrikaans are sometimes spoken in the south and east, especially by people who have migrated to Namibia and Zambia as workers or refugees, while French and Lingala are often understood among the Bakongo in the north.

Religion. The numerous and highly localized traditional animist religions of Angola are giving way to Christianity and syncretic Afro-Christian religions. The first centuries of Portuguese presence on the coast resulted in few conversions—apart from the early and atypical case of the Kongo kingdom—and it was only in the 20th century that Roman Catholic and Protestant missionaries began to have a major impact. The Roman Catholic church, to which more than two-thirds of Angola's Christians belong, is especially well established among the Ovimbundu. Various Protestant groups, with strong American and British links, make up the remaining Christians. Baptists have traditionally worked among the Bakongo people, Methodists among the Mbundu, and Congregationalists among the Ovimbundu. Afro-Christian religions, especially the Our Lord Jesus Christ Church in the World (Tocoist church), have spread from Zaire. Protestants and Tocoists were suspected of subversion in colonial times and suffered various forms of petty persecution. All religion was frowned upon by the Marxist-Leninist government in Luanda after 1975, and religious institutions lost their schools, clinics, newspapers, radio stations, and properties. However, freedom of conscience was legally guaranteed, and the Methodist church, which educated most of the government leaders, was relatively privileged. Other Christian denominations were closely watched and occasionally harassed, and the Jehovah's Witnesses were formally banned in 1978. Religious organizations regained considerable influence when the government abandoned communism, especially the Roman Catholic church, which played an important role behind the scenes in securing national reconciliation. Angola is unusual in Africa in having no Muslim population.

Status of religion after independence

Demographic trends. With only some 10 million inhabitants and a population density of about 21 people per square mile (8 people per square kilometre), the country is thinly populated, even by African standards. Vast areas in the semidesert coastal strip and the eastern two-thirds of the country are almost empty. War and famine are estimated to have killed about half a million people after 1975, but the population growth rate remains high. The birth rate is about average for southern Africa, but the high death rate has depressed the country's overall natural increase rate to a level well below average for the region. Life expectancy is low at 43 years for men and 46 years for women, and the population is predominantly young. Decades of warfare have resulted in about a tenth of the population living as internal refugees, congregating in the cities. It is estimated that about half a million people fled abroad during the anticolonial war, mainly Bakongo fleeing to Zaire and some Chokwe, Lunda, and Ngangela fleeing to Zambia. There was a renewed outflow of refugees in 1975, with the departure of more than 300,000 Portuguese and an unknown number of Africans. Many Bakongo refugees have returned to Angola, however, and there is even some immigration of Zairean Bakongo, who are attracted by employment opportunities in Angola's oil economy.

The economy. Angola had a diversified and rapidly growing economy in the late colonial period, but it suffered

badly after independence. A destructive civil war, the nationalization of most large enterprises, ineffective central planning, a heavily overvalued currency, and a constant exodus of skilled personnel were the main negative factors. From being the fourth largest coffee producer in the world, Angola sank to a position of complete insignificance. Manufacturing output slumped badly. Workers suffered a dramatic fall in living standards and were prevented from joining any kind of autonomous trade union. Angola was a net exporter of food before independence, but the country suffered from some of the worst famine conditions in Africa in the 1980s. Humanitarian aid has been hampered by poor security and political pressures. Economic reforms launched in 1988 remained largely ineffective, owing to the obstruction of the ruling party and the bureaucracy. The abandoning of Marxism-Leninism and the end of the civil war in 1991 offered new hope to a severely battered economy, which has the potential to be at the forefront of African development.

Growth of oil sector

The major exception to this dismal economic record has been the oil sector, which has made giant strides, boosting Angola to rank second as an oil producer in sub-Saharan Africa. Non-Portuguese foreign capital was exempted from outright nationalization, and, although the state took a share in the oil companies, management remained firmly in foreign hands. Moreover, the oil industry was protected from the worst effects of the fighting by its location on the coast and by the presence of Cuban troops. Oil accounts for more than 90 percent of Angola's foreign exchange earnings. Most of the rest comes from diamonds and fish, which have also remained mainly under foreign management. However, the linkage of the petroleum industry to the rest of the economy is minimal. The oil companies employ little local labour and do not reinvest their profits outside the oil sector. Nearly half of oil royalties have been spent on defense, and most of the rest has gone to pay for imports of essential foodstuffs for the urban population.

Resources. Angola's resources are considerable in comparison to those of most African countries, and they are particularly suited to the development of an industrial economy. There are large reserves of oil and natural gas, concentrated in the maritime zones off the Cabinda exclave and the Congo estuary. Total proven recoverable reserves of crude oil stood at more than 2 billion barrels in 1990. The quality of the oil is generally good, with a low sulfur content. Natural gas reserves are estimated at about 1.8 trillion cubic feet (50 billion cubic metres). Alluvial diamonds occur widely over the northeastern quarter of the country, with a high proportion of gemstones, and there are several kimberlite pipe formations that may be mined. Large iron ore reserves exist in the southwestern part of the country, but they are low-grade. Other minerals are known to exist in commercial quantities in Angola, especially in the area of the escarpment, but a great deal of systematic prospecting work needs to be done to gain a complete picture of the country's mineral resources. Angola's hydroelectric potential is one of the largest in Africa, estimated at more than 7,500 megawatts. Owing to the beneficial effects of the cold Benguela Current, Angola also has some of the richest fishing grounds in Africa, especially in the far south of the country. Stickleback, sardine, mackerel, catfish, mullet, and tuna are abundant, as are crabs, lobsters, and prawns. Timber resources are significant, with some 130 million acres of forest. The Maiombe forest in the north of the Cabinda exclave contains the most valuable commercial species, notably white tola (*Balsamiferum harms*) and limba (*Terminalia superba*). There are also stands of commercial timber along the rivers of the southeast, especially mussibi (*Guibourtia coleosperma*).

Agricultural resources

Fertile agricultural land is limited to a few favoured locations in the highlands and river valleys, and less than 10 percent of the land area is thought to be arable. The combination of poor soils and insufficient rainfall over most of Angola is a severe limitation to the growing of crops. However, the country's agricultural potential remains underutilized outside the Bié Plateau, the coastal oases, and the Ovambo floodplain on the Namibian border. Pastoralism is inhibited by tsetse fly infestation, poor pastures, and the lack of surface water in the Kalahari Sand zone. Conditions for pastoralism are best in the southwestern quarter of the country.

Agriculture and forestry. Prior to independence, a large estate sector dominated by Portuguese settlers coexisted with numerous small indigenous producers. Only about 3 percent of the land area was under cultivation. Of the cultivated area, less than 1 percent was irrigated. Coffee was king, and Angola supplied 19 percent of world coffee in 1974, with an annual output of more than 200,000 tons of green coffee in the early 1970s. Production was concentrated in the Malanje highlands and along the northwestern margins of the Bié Plateau and came mainly from the plantation sector. Cotton, consumed in local industries or exported to Portugal, was produced by both smallholders and planters in the Kwango valley and the coastal plain. The local market was entirely supplied by sugar intensively cultivated under irrigation by planters in the coastal oases. Oil palms, bananas, and other tropical fruits were associated with sugar on these plantations. Sisal was an estate crop cultivated mainly on the western slopes of the Bié Plateau, but its importance diminished in the 1960s, and it was often replaced by tobacco. Angola was a net exporter of food, with corn (maize) from highland African producers as the chief commercial food crop. Cassava (manioc) was widely grown as a subsistence crop by indigenous producers, together with millet, sorghum, beans, sweet potatoes, peanuts (groundnuts), rice, wheat, and potatoes. Cattle were concentrated in the southwest and were raised partly by traditional methods and partly on large modern ranches. Other livestock played little role in the commercial economy, but goats, pigs, and chickens were important for subsistence. Timber extraction from natural forests was concentrated in Maiombe in the Cabinda exclave and in Luso on the eastern stretch of the Benguela Railway. Some 123,500 acres of eucalyptus plantations along the western stretches of the Benguela Railway provided firewood for the steam locomotives and fed the paper-pulp plant near Benguela.

Agriculture after independence

This flourishing agricultural sector declined after independence. The nationalization of estates was followed by the creation of inefficient state farms. Ovimbundu contract labourers refused to work in areas where they were open to ethnically motivated attacks, notably in the coffee zones, and forced labour from the towns (the so-called voluntary brigades) proved a poor substitute. Smallholders were burdened with a centrally imposed system of cooperatives and by an inefficient public system of purchasing and distribution, which replaced the Portuguese petty traders who fled the country. The transport network deteriorated, insecurity spread throughout the country, the overvaluation of the currency acted as an increasingly heavy de facto tax on exports, and the collapse of manufacturing removed all incentives to sell to the towns. As a result, the urban population came to depend on food imported from abroad.

Agricultural collapse has been an uneven process. Subsistence crops have been little affected, commercialized food crops have done badly, and industrial raw materials and exported products have fared disastrously. Production of cassava and sweet potatoes actually rose slightly after independence, while the output of sorghum and beans fell by about 50 percent. Production of corn, bananas, and timber sank to about a quarter of their former levels, while only about a tenth of the sugar and beef output prior to 1975 was maintained. Coffee, cotton, and sisal plummeted to a mere 2 percent of former production levels.

Fishing. Before independence, there were about 700 vessels active in fishing, employing some 13,000 people, with an annual catch of about 300,000 tons. Namibe was the centre of this fishing industry, which stretched from Luanda in the north to the Bay of Tigres in the far south. The great majority of the catch was processed in modern factories and exported to Western markets frozen, canned, or as fish meal. A more traditional fish drying and curing industry supplied the local market and exported to a wider regional market before the anticolonial war began in 1961. Most of the fishing vessels, owned largely by the Portuguese, sailed away after 1975, packed with refugees, and the factories were destroyed or rusted away. Foreign

boats were then given licenses to fish in Angolan waters, on condition that a proportion of the catch be landed in Angolan ports. Some of the processing works were also renovated with the assistance of foreign aid. This arrangement kept the fishing industry alive at a time when much of the rest of the economy was collapsing. The catch fell to about three-quarters of preindependence levels, possibly because of declining fish stocks resulting from past overfishing or ecological changes.

Mining. Crude oil production is central to the economy, and production has nearly tripled since independence. Because Angola is not a member of the Organization of Petroleum Exporting Countries (OPEC), the country is not subject to any restrictive quotas on its exports. Angola enjoys promising geologic conditions, a high rate of exploration success, and relatively low operating costs.

Petroleum production

Production is concentrated off the coast of Cabinda, especially in the huge Takula field, and off the Congo estuary. Experiments show that deep-water operations in this zone may be profitable. There is some onshore production near Soyo and Luanda, and prospecting extends as far south as Kwanza Sul. Natural gas deposits have been found, but production is on a small scale. A state company was set up in 1977, under the name of the Sociedade Nacional de Combustíveis de Angola (Sonangol), to engage in joint ventures and production-sharing agreements, while leaving the management of the oil business largely in foreign hands. Chevron (United States) controls the Cabinda Gulf Oil Company, which is responsible for a little more than half of total oil output. Elf Aquitaine (France), Texaco (United States), and Petrofina SA (Belgium) are the other three companies producing oil in Angola, the latter exclusively from declining onshore oil fields. A host of other companies from around the world have been involved in prospecting for hydrocarbons, including companies from the United States, France, Italy, Spain, Portugal, Germany, Britain, Sweden, Norway, Brazil, and Japan.

Before independence, Angola was the fourth largest diamond exporter in the world in terms of value, with exports standing at 2.4 million carats, but output almost ceased after 1975, rose again in the late 1970s, and then crashed once more in the 1980s. The government nationalized the 77 percent stake held by Portuguese investors in the Angola Diamond Company (Companhia de Diamantes de Angola, or Diamang) and ran diamond mining in the northeast through the National Diamond Enterprise of Angola (Empresa Nacional de Diamantes de Angola, or Endiama), a parastatal company. Management problems were compounded by corruption, insecurity, and deteriorating relations with the Central Selling Organisation, controlled by the De Beers company of South Africa. In 1986, diamond mining was turned over to foreign enterprises under production-sharing agreements, and two years later the Angolans began negotiations with De Beers over diamond sales and technical assistance for the exploitation of kimberlite pipes. Output expanded again, and with the restoration of peace Angola is set once again to be a major player on the world diamond scene.

There are no other mining operations of any significance, although iron ore from the southwest was Angola's fourth most valuable preindependence export. But the Cassinga iron mines were heavily subsidized by the Portuguese, and their profitability was open to doubt. Production declined and ceased between 1975 and 1984, and the quality of the ore reserves is probably too poor to warrant the reactivation of the mines. Copper, manganese, gold, marble, black granite, and quartz have been mined or quarried on a small scale and there are plans to exploit phosphate deposits in Cabinda and Zaïre provinces.

Industry, construction, and utilities. Manufacturing, construction, and the hydroelectric industry were expanding rapidly prior to independence, but they were severely disrupted in the chaos that followed. Nationalization and the loss of skilled labour hit manufacturing especially hard, and UNITA guerrillas proved particularly effective at sabotaging electricity and water supplies. Huge debts accrued to the state, and factories operate on average at less than 30 percent of their capacity. Workers are paid partly in the goods produced by the factory (in spite of numerous official attempts to prevent this practice), absenteeism is rife, and productivity is abysmally low. Apart from some minor processing of primary exports, manufacturing is essentially import-substituting in nature and is concentrated in food, tobacco, cotton textiles, electrical goods, metals, vehicle assembly, oil refining, sawmills, cement, and construction for the oil industry. Most electricity comes from dams on the Kwanza, Kunene, Catumbela (Katumbela), and Dande rivers, at points where they breach the escarpment to reach the coastal plain. A large share of the country's installed generating capacity of more than 600 megawatts is out of use. Most of the nationalized manufacturing industries, construction businesses, and public utilities are being returned to the private sector, in some cases to their former owners.

Major manufactured goods

Finance. Banks were nationalized after independence. The National Bank of Angola (Banco Nacional de Angola) acts as central bank, bank of issue, and commercial bank, while the People's Bank of Angola (Banco Popular de Angola) acts as deposit bank. Foreign banks began to reenter the country in 1985, but banking remains overwhelmingly in the hands of the state. Most savings are held in informal banking structures outside the cumbersome state system. Foreign investment is highly concentrated in oil, diamonds, and fishing, but it is set to spread through the economy as liberalization proceeds and nationalized assets are returned to the private sector.

Trade. Oil accounts for more than 90 percent of exports; about two-thirds goes to the United States, where the low sulfur content of the crude oil is appreciated by refineries. The economy is thus highly vulnerable to shifts in the price of oil. After independence there was an attempt to obtain a growing proportion of imports from the communist bloc, and even to join Comecon. Huge quantities of arms were obtained, but otherwise this strategy met with little success. Civilian imports come mainly from Portugal, France, Brazil, and the United States. In addition to machinery, vehicles, and pharmaceuticals, Angola imports large amounts of food and raw materials, nearly all of which could easily and cheaply be produced locally. Even raw cotton is imported. While Angola's trade in commodities has remained in the black, the balance of payments has generally been in deficit, leading to the accumulation of arrears and the growth of the foreign debt. The return of peace should bring down imports of weapons and food, while the devaluation of the highly overvalued currency should boost exports.

Transportation. Angola achieved independence with an excellent transport network for an African country so large and thinly populated, in part because of Portuguese military imperatives after 1961. This sector of the economy has suffered more than any other from the effects of war and the lack of maintenance, and a rehabilitation plan, backed by foreign aid, was launched in 1988.

A grid of tarred roads links the major geographic centres of economic activity; in the late 1980s there were about 23,000 miles of paved road. They run into Zaire and Namibia and come close to the Zambian frontier. The complete road network totaled more than 46,000 miles in 1973. During the civil war, travel on the roads was almost impossible except in convoy with an armed escort, and numerous bridges were destroyed. Bus service between towns has ceased, and public transport within towns has almost ground to a halt. Taxis are rare.

Railways

The Benguela Railway is the longest of the country's railways, extending from Lobito on the coast to the Zairean frontier, and is owned in part by Tanks Consolidated Investments, a subsidiary of the Société Générale de Belgique. It provides the shortest route to the sea for the Zairean copper mines, on which the railway's profitability depends, but it has not functioned to the east of Huambo since the civil war began and has often been completely out of use. The Luanda Railway, which was nationalized in 1918, depends on coffee and cotton for its traffic, while the Namibe Railway, which was owned by the state from the outset, depends on iron ore. Both railways have functioned only episodically since independence. The short private Amboim Railway in Kwanza Sul has been out of action since the collapse of the plantations it served.

Lobito is the finest and best-equipped port in the country, but it has been underutilized since corn exports from the Bié Plateau and mineral traffic from Zaire ceased, with traffic reduced to about one-fifth of preindependence levels. Luanda has a good harbour, but it has been poorly managed, long delays are experienced, and it handles less than half the cargo it did before 1975. Since iron ore shipments have stopped, Namibe's activity has been based essentially on its role as the country's major fishing port. In contrast, Malongo and Soyo have grown in importance with the oil boom, although they are much poorer natural harbours. The lower Congo River is used by seagoing vessels up to Nóqui on the Zairean frontier, and small craft ply the lower Kwanza for about 140 miles. The merchant navy consists of several cargo vessels, unadapted to container traffic, which are run by a parastatal company. Most cargo is carried on foreign ships.

Travel by air became the only safe means of transport during the civil war, and the network of airfields left by the Portuguese has been intensively used. The number of passengers carried has more than quadrupled since 1975. The national airline, TAAG (Linhas Aéreas de Angola), has a fleet of 20 aircraft. Foreign airlines land only in Luanda.

Administration and social conditions. *Government.* Colonial rule was exercised by a right-wing dictatorship in Portugal from 1926, and the transfer of power at independence took place without any form of election. The Popular Liberation Movement of Angola (Movimento Popular de Libertação de Angola; MPLA) seized power in the main cities by force of arms, and the constitution of Nov. 11, 1975, as amended in October 1976, established a one-party state modeled on those of eastern Europe. The MPLA officially became a Marxist-Leninist vanguard party in 1977 and moved into close dependence on the Soviet Union and Cuba. The latter provided troops to combat a guerrilla challenge mounted by the National Union for the Total Independence of Angola (União Nacional para a Independência Total de Angola; UNITA). Faced with an endless war and the collapse of most of the economy, in 1985 the MPLA initiated a timid process of economic reform and began to turn more to the West. Cuban troops began to withdraw in 1989, following South African acceptance of Namibian independence in December 1988, and in 1990 the MPLA abandoned Marxism-Leninism. The civil war ended in 1991 with an agreement to introduce a new constitution. The political system is now based on the principles of the guarantee of full human rights and multiparty elections for the presidency and for parliament. However, in order to prevent the emergence of ethnically based parties, all political parties must prove that they have support in a majority of the country's 18 provinces before they can compete in elections.

Political movements

Education. After decades of neglect, the Portuguese began a crash program of education in 1961, resulting in a literacy rate of between 10 and 15 percent at independence. The MPLA aimed to achieve primary education for all after independence and tripled primary school enrollment between 1976 and 1979. However, this was followed by a halving of primary school enrollment during the 1980s. Conditions in schools declined dramatically, with an acute shortage of teachers and a lack of the most basic teaching materials, including books. Enrollment in secondary schools and in the university, which was founded in 1962, expanded continuously after 1975, as these institutions suffered less than primary schools from political insecurity. But there was a severe lack of teachers and teaching materials, and most faculties in the university have been closed for long periods because of alleged political agitation. It is estimated that recruitment into the armed forces of the MPLA and UNITA has had a greater impact than the formal educational sector on the spread of literacy, the increased use of Portuguese, and the acquisition of technical skills. Many Angolans have also been trained abroad, especially in Cuba and the Soviet Union.

Health and welfare. As with education, the Portuguese made a major effort to "win hearts and minds" after 1961 by expanding health and welfare programs. The MPLA government came to power with even more ambitious schemes, but initial successes were followed by an almost complete collapse of services, especially in the rural areas. Doctors and other medical personnel have been particularly prone to flee abroad, and they are reluctant to work in remote and dangerous parts of the country. Medicines are in short supply. Malaria and severe malnutrition are rife, and cholera epidemics are a frequent occurrence. Infant mortality rates are among the highest in the world. Urban housing schemes have been submerged by the flood of refugees from the countryside. Social conditions and the health situation in Luanda's slums have been worsened by acute shortages of water. Unemployment, inflation, empty shops, and the collapse of public transport have hit the slum dwellers hard, while the political and bureaucratic elite have benefited from a network of special shops, good housing, and other advantages financed from the proceeds of the oil economy.

Social conditions

Cultural life. Angolan culture is fragmented into a myriad of highly localized clusters, but its origins lie within a broad central African Bantu tradition, shared with neighbouring countries. Angolan peoples generally trace their descent through their mothers, and lineages or extended families are important in social life. People often give some allegiance to precolonial kings and chiefs, even though their political functions have long been in abeyance and they may be situated on the other side of a modern political frontier. There are also strong vestiges of a widespread precolonial system of slavery, which the colonial authorities were slow to abolish. Polygamy, the veneration of ancestors, and combating witchcraft are practiced, even by many converts to Christianity. Wood, clay, copper, reeds, ivory, shells, and the human body are the main media for the decorative arts. The wooden sculptures of the Chokwe people, the carved ivories of Cabinda, and the elaborate hair styles of the Nyaneka and Nkhumbi peoples are especially famous. Music and dancing play a central role in cultural life, with drums as the basic instrument, and there is a rich oral literature. There have been attempts to preserve this cultural heritage, which remains largely outside the domain of formal cultural institutions, but political instability and corruption after 1975 led to tragic losses of ethnographic collections.

Traditional culture has been increasingly overlaid by Western influences, which tend to predominate in the towns. The 19th century saw the emergence of a dynamic group of educated Creoles in Angolan towns, similar in some respects to those of Sierra Leone, who wrote newspaper articles, history books, novels, and poems in Portuguese. The right-wing dictatorship in Portugal drove much of this literary activity underground after 1926 but failed to destroy it altogether. The leader of the MPLA at independence, Agostinho Neto (1922–79), was famous for his poetry throughout the Portuguese-speaking world. The MPLA government exercised a rigorous system of censorship, and the output of the officially sponsored Union of Angolan Authors since 1975 has been disappointing. This was to some extent offset by the emergence of a national television service and the beginnings of a national film industry. An ambitious program to expand museums, libraries, and archives bore little fruit. Indeed, many fine collections built up in colonial times were destroyed, dispersed, or made unavailable to the public.

Effects of Western influences

Sports are completely dominated by football (soccer), which is a national passion and is played by people of every social stratum. Some Angolans have become footballers of distinction, but they tend to play in the clubs of Portugal and other European countries, where conditions are more attractive.

For statistical data on the land and people of Angola, see the *Britannica World Data* section in the BRITANNICA BOOK OF THE YEAR.

HISTORY

The Stone Age population of Angola was very sparse. Ironworking and settled agriculture spread during the 1st millennium AD, but hunting and gathering remained important for centuries. Bantu languages may have entered Angola with iron technology, and they were certainly spoken by the 15th century.

The slave trade. Portuguese navigators reached the

Kongo kingdom in the northwest in the 1480s and converted the king of Kongo, together with many Bakongo, to Christianity. Rumours of great silver mines in the interior and the growth of the slave trade led to a more aggressive policy. Paulo Dias de Novais was granted 140 miles of coastline with the right to conquer the interior, and he founded Luanda with 400 settlers in 1575. The wars of conquest launched by Novais lasted until 1680. No silver mines were found, but the Portuguese gained a precarious hold over the lower Kwanza River and parts of the Malanje highlands, and they occupied Benguela in 1617. The Dutch, French, and British undermined the Portuguese trade monopoly in Angola from the 17th century. The Dutch even seized Luanda and Benguela in 1641, but they were driven out by an expedition sent from Brazil in 1648.

The slave trade dominated Angola's economy, although some wax, ivory, and copper were also exported. Portuguese sugar plantations, first in São Tomé and then in Brazil, used slaves, and about a third of all slaves exported from Africa across the Atlantic left from the ports of Angola and Congo. Angola was not densely populated, and the slaving frontier expanded continuously, reaching the centre of Africa in the 18th century. The Portuguese raided for some of the slaves they exported, but from the end of the 17th century they usually bought them from Africans, who procured slaves through raiding, debt, judicial procedures, and the sale of children in times of famine. The introduction of corn (maize) and cassava from the Americas may to some extent have counterbalanced the negative demographic effects of the slave trade.

Decline of Kongo

The expansion of the slave trade destroyed some kingdoms but raised up others. Kongo entered into steep decline in the 17th century, while the Loango kingdom flourished north of the Congo estuary. The Ndongo kingdom in the Malanje highlands rose with the slave trade, but it was destroyed when the Portuguese pushed inland in the 17th century, to be replaced by the Kasanje kingdom in the Kwango valley. Farther east, the Lunda empire emerged as a great slave supplier in the 18th century. In the Bié Plateau, half a dozen warrior kingdoms fought for supremacy. Southern Angola was little involved in the slave trade, for its population was small and its inhabitants could sell cattle to procure imports.

Colonial transition, 1820s–1910. The export of slaves was banned in Angola in 1836, but it was not until the Brazilian market was closed in the early 1850s that slave exports fell. Slavery itself was legally abolished in the Portuguese empire in 1875, but it continued in thinly disguised forms until 1911. Slaves were exported to the coffee and cocoa plantations of São Tomé from the 1860s and were used in Angola to produce coffee, cotton, sugar, and fish. But from the 1850s, exports were dominated by products hunted or collected by Africans, first ivory and wax and later wild rubber. The Ovimbundu turned from slave raiding to long-distance trade, and their caravans penetrated as far east as Lake Tanganyika. The Chokwe were expert hunters of elephants and collectors of wax and rubber, and they used their accumulated firearms to overthrow the Lunda empire in the 1880s. The Kasanje kingdom collapsed when illicit slave trading undermined the king's central slave mart.

Angolans closer to the coast were more affected by the slow expansion of Portuguese colonialism and by the loss of land to settlers. Cotton and sugar were grown from the 1840s in oasis plantations in the coastal strip, and immigrants from the Algarve built up the fishing industry. Spontaneously occurring stands of coffee drew the Portuguese to carve out plantations in the Malanje highlands from the 1830s, and work on the railway from Luanda to Malanje commenced in 1885. In 1902 the building of the Benguela Railway began, after a brief campaign against the Ovimbundu, to serve the Katanga (Shaba) mines in the Belgian Congo. Portuguese small farmers were settled in the Huíla highlands from the 1880s, to counterbalance an influx of Boer trekkers from South Africa, and the southern railway was begun in 1905. In the Maiombe forests of the far north, plantations of cacao and oil palms were laid out in the 1900s.

Angola's frontiers were finally determined by negotiations in Europe in 1891, but the Portuguese only administered areas with plantations and railways and introduced systematic taxation of Africans only in 1906. Many positions in the colonial administration were held by Angolan Creoles, who were accepted as full Portuguese citizens. The spread of British and American Protestant missions from the 1870s was countered by subsidizing French Roman Catholic missions.

Development of colonial adminstration

From colonial conquest to independence, 1910–75. The proclamation of the Republic of Portugal in Lisbon in late 1910, followed in 1926 by the creation of the authoritarian New State (Estado Novo), marked the advent of modern Portuguese colonialism. The authorities stamped out slavery and undertook the systematic conquest of Angola. By 1920, all but the remote southeast of the colony was firmly under Portuguese control. Kingdoms were abolished, and the Portuguese worked directly through chiefs, headmen, and African policemen. Conversions to Christianity increased, and by 1940 there were about a million Christians in Angola, some three-quarters of them Roman Catholics. Angolan "natives" were taxed and subjected to forced labour and forced cultivation. A stringent set of tests were imposed on the few nonwhite "assimilated persons" who applied to be exempted from these impositions. Creoles were increasingly replaced by Portuguese immigrants in the administration.

Angola's economy was modernized and bound to that of Portugal by a system of protective tariffs. A network of dirt roads was built, and the Benguela Railway was completed to the boundary of the Belgian Congo in 1928. Lorries and fixed stores replaced trading caravans. Coffee, sugar, palm products, and sisal came mainly from the estate sector, and corn and cattle from smallholders. The cultivation of raw cotton for Portuguese textile mills was imposed by force. Alluvial diamond mining dominated the northeast from 1912, the fishing industry expanded, and a start was made with import-substituting industries.

After the independence of the Belgian Congo (later Zaire) in 1960, a major revolt rocked northern Angola in 1961; it was followed by a long guerrilla war. Land alienation and forced labour sparked off the rebellion in the coffee zone, while in the Kwango valley the peasants rose against forced cotton cultivation. In Luanda, an attack on the prison was led by frustrated Creoles. To contain the revolt, the Portuguese deployed large numbers of troops, set up strategic hamlets (forced settlements of rural Angolans), and, by encouraging Portuguese peasants to immigrate to Angola, raised the white population to about 330,000 by 1974. At the same time, they tried to "win hearts and minds" by abolishing forced cultivation, forced labour, and the stringent tests to gain "assimilated" status. They also stepped up the provision of education, health, and social welfare services and protected peasants from land alienation. The economy entered into a period of sustained boom, marked by rapid industrialization and the growth of oil production, and urban workers and many rural producers enjoyed rising standards of living.

The armed struggle continued, but the anticolonial guerrillas were seriously weakened by dissension. The Popular Liberation Movement of Angola (Movimento Popular de Libertação de Angola; MPLA) was founded in 1956 with the help of the clandestine Portuguese Communist Party; it was led by Agostinho Neto from 1962. It was popular in Luanda and among some rural Mbundu, and it drew foreign support from the Soviet Union. Initially based in Brazzaville, the MPLA moved to Zambia in 1965. The National Front for the Liberation of Angola (Frente Nacional de Libertação de Angola; FNLA), founded in 1957 under another name and led by Holden Roberto, drew its support from the Bakongo and some rural Mbundu. Based in Zaire, the FNLA obtained aid from the United States and China. In 1966 Jonas Savimbi set up a third movement, the National Union for the Total Independence of Angola (União Nacional para a Independência Total de Angola; UNITA), with a predominantly Ovimbundu leadership and with some support from the Chokwe and Ovambo. UNITA enjoyed little foreign backing (although China provided some aid) and lacked a secure foreign base,

Founding of MPLA, FNLA, and UNITA

since Zambia leaned toward the MPLA. The divisions between and within these three movements, which at times degenerated into armed conflict, allowed the Portuguese to gain the upper hand by the early 1970s. When a military coup in Portugal overthrew that country's dictatorship in April 1974, all three guerrilla movements had been almost entirely expelled from Angolan soil.

Independence. The three liberation movements proved unable to constitute a united front after the Portuguese coup. The FNLA's internal support had dwindled to a few Kongo groups, but it had strong links with the Zairean regime and was well armed; it thus made a bid to seize Luanda by force. The MPLA, with growing backing from the Portuguese Communist Party, Cuba, and the Soviet Union, defeated this onslaught and then turned on UNITA, chasing its representatives out of Luanda. UNITA was militarily the weakest movement, but it had the greatest potential electoral support, given the predominance of the Ovimbundu within the population, and it thus held out most strongly for elections. But the Portuguese army was tired of war and refused to impose peace and supervise elections. The Portuguese therefore withdrew from Angola in November 1975 without formally handing power to any movement, and nearly all the white settlers fled the country.

Portuguese withdrawal

The MPLA, in control of the capital city, declared itself the government of independent Angola and managed to win recognition from many African countries. UNITA and the FNLA set up a rival government in Huambo and called on a South African column to eject the MPLA from Luanda. The Cubans poured in troops to defend the MPLA, pushed the internationally isolated South Africans out of Angola, and gained control of all the provincial capitals. The Cuban expeditionary force, which eventually numbered some 40,000 to 50,000 soldiers, remained in Angola to pacify the country and ward off South African attacks. In 1977 the MPLA crushed an attempted coup by one of its leaders and, after a thorough purge, turned itself officially into a Marxist-Leninist party. The transformation of the economy along communist lines was pursued, with disastrous results. The major exception was the oil industry, which, managed by foreign companies, grew rapidly enough to enable Angola to stave off economic and military collapse. President Neto died in 1979 and was succeeded by the former minister of planning, José Eduardo dos Santos.

The FNLA withered away in exile, but UNITA reorganized itself with foreign backing—notably from the United States and South Africa—as an effective guerrilla force. Failed campaigns launched by the MPLA in 1987–88 and the increasingly effective UNITA attacks on oil installations forced the MPLA to adopt a more conciliatory posture, but a historic meeting between dos Santos and Savimbi in June 1989 produced only a short-lived ceasefire.

With the collapse of communism in eastern Europe, in mid-1990 the MPLA abandoned the one-party state and produced a new constitution allowing free elections that included UNITA. Cuban troops withdrew in 1991, and, although an agreement to disarm all forces had not yet been met, elections were held in 1992 under United Nations supervision. Dos Santos was elected president, and the MPLA gained a majority in the parliament. UNITA made a strong showing but, charging election fraud, renewed the civil war. At the end of 1992, UNITA controlled approximately two-thirds of the country; this area included Angola's wealthiest diamond mines, which funded UNITA's operations. Fighting raged throughout 1993 as the government gradually regained territory, and international pressure mounted for the two sides to reach a peaceful solution. Finally, the combatants signed an agreement called the Lusaka Accord, which allowed UNITA to be reintegrated into the government. Although minor fighting between the two groups continued, dos Santos and Savimbi met several times over the next three years to resolve issues relating to the final form of the combined government. UNITA delegates formally joined the government in 1997, but relations between the two groups were further complicated that year by the civil war in Congo (Kinshasa). UNITA supported the crumbling government regime because it had been a conduit for UNITA's illicit diamond trade, while the Angolan government supported the rebels led by Laurent Kabila.

By the end of the decade, hostilities between the government and UNITA had resumed, and the UNITA delegates had been expelled from the government. The issue was not resolved until February 2002 when government troops caught up with Savimbi and killed him. A cease-fire between UNITA and the government was signed in April, and the war was officially declared over in September; the government focused on rebuilding the crumbling infrastructure and stabilizing the economy. (W.G.C.-S./Ed.)

For later developments in the history of Angola, see the BRITANNICA BOOK OF THE YEAR.

Botswana

The Republic of Botswana is a landlocked country with an area of 224,607 square miles (581,730 square kilometres) in the centre of southern Africa. The capital is Gaborone. The territory is roughly square—approximately 600 miles from north to south and 600 miles from east to west—with its eastern side protruding into a sharp nose. Its eastern and southern borders are marked by river courses and an old wagon road; its western borders are lines of longitude and latitude through the Kalahari, and its northern borders combine straight lines with a river course.

Botswana is bounded by Namibia to the west and north (the Caprivi Strip), Zambia and Zimbabwe to the northeast, and South Africa to the southeast and south. The Zambezi River border with Zambia is only several hundred yards long. The border along the main channel of the Chobe River up to the Zambezi is disputed with Namibia. The point at which the borders of Botswana, Namibia, Zambia, and Zimbabwe meet in the middle of the river has therefore never been precisely determined.

Before its independence in 1966, Botswana was a British protectorate known as Bechuanaland. It was also one of the poorest and least-developed states in the world. The country is named after its dominant ethnic group, the Tswana, or Batswana ("Bechuana" in older variant orthography). The national language is Setswana (or Sechuana), and the official language is English.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief and drainage.* Botswana extends from the Chobe River (which drains through the Zambezi to the Indian Ocean) in the north to the Molopo River (part of the Orange River system, which flows into the Atlantic) in the south. To the east it is bordered by the Limpopo River and its tributaries, the Ngotwane (Notwani), Marico (Madikwe), and Shashe.

The country has a mean altitude of 3,300 feet and consists largely of a sand-filled basin, with gently undulating plains rising to highlands in neighbouring countries. The highest point is 4,888 feet (1,490 metres) in the hills north of Lobatse in southeastern Botswana; the lowest point is 2,170 feet at the country's easternmost point, in the Limpopo valley.

The country is divided into three main environmental regions. The hardveld region consists of rocky hill ranges and areas of shallow sand cover in eastern Botswana. The sandveld region is the area of deep Kalahari sand covering the rest of the country. The third region consists of ancient lake beds superimposed on the northern sandveld in the lowest part of the Kalahari Basin.

Geologic exploration has been limited by the depth and extent of Kalahari sand covering the surface geology. The rock groups underlying most of the sandveld are therefore the least-known but appear to be the youngest, belonging to the Karroo (Karoo) System, formed 290 to 208 million years ago. Elsewhere, Precambrian rock formations predominate. The surface geology of the eastern hardveld, exposed in its hill ranges, largely consists of basement complex rocks (more than 2.5 billion years old) intruding from the Transvaal and southern Zimbabwe. This complex is known to extend into younger rock formations (2.5 to 1.2 billion years old) in the extreme southern sandveld,

Geology

while rocks of the Ghanzi and Damara groups (1.2 billion to 570 million years old) extend across the northwest corner of the country into northern Namibia.

Drainage through the marshes of the Okavango delta is complex and imperfectly understood. The perennial Okavango River runs southward into its delta across the Caprivi Strip from the highlands of Angola. Most of its water evaporates from the 4,000 square miles of the delta wetlands. Floodwater reaches down through the eastern side of the marshes to the Boteti River, which flows sporadically to Lake Xau (Dow) and the Makgadikgadi Pans (also roughly 4,000 square miles in area). Less and less water has been flowing through the western side of the Okavango marshes during the 20th century, so that 70-square-mile Lake Ngami—famous a century ago—is today dry and almost unrecognizable as a lake. Meanwhile, the eastern Makgadikgadi Pans are annually flooded by the otherwise ephemeral Nata River from the Zimbabwe highlands, while the southern tributaries of the pans are now dry fossil valleys.

Islands of papyrus and other aquatic vegetation in the delta of the Okavango River, northern Botswana.

The Molopo River and its Ramatlhabama tributary, on the southern border of Botswana with a course flowing into the Orange River, today rarely flood more than 50 miles from their sources. Most rivers in Botswana are ephemeral channels, usually not flowing above ground except in the summer rainy season. The two great exceptions to this rule are vigorous channels fed by the rains of central Africa—the Okavango River above its delta and the Chobe River flowing through its marshes along the northern border to join the Zambezi above the Victoria Falls.

Soils. The soils of the eastern hardveld consist of moderately dry red loamy *mokata* soils on the plains, or mixed chalky and sandy *chawana* soils, with brownish rocky *seloko* soils on and around hills. *Seloko* soils are considered best for grain crops. The fertility of all soils is limited by the amount of rainfall, which is sometimes inadequate on the hardveld and regularly unable to support any cultivation on the sandveld.

Soil fertility

The alluvial soils of the ancient lake beds include gray loamy soils in the wetlands, gray-green saline soils on the pans, gray clayish soils to yellowish sandy soils around the wetlands, and very chalky light gray soils around the pans. There are also areas of gray to black cracking clay in former wet areas, such as those around Pandamatenga.

Climate. The annual climate ranges from months of dry temperate weather during winter to humid subtropical weather interspersed with drier periods of hot weather during summer. In summer (which lasts from October to March) temperatures rise to about 93° F (34° C) in the extreme north and southwest, the warmest parts of the country. In winter (which lasts from April to September), there is frequent frost at night, and temperatures may fall to near freezing in some high-altitude areas during the day. Summer is heralded by a windy season, carrying dust from the Kalahari, from about late August to early October. Annual rainfall, brought by winds from the Indian Ocean, averages 18 inches (460 millimetres), representing a range from 25 inches in the extreme northeast to less than 5 inches in the extreme southwest. The rains are almost entirely limited to summer downpours between December and April, which also mark the season for plowing and planting. Cyclic droughts, often lasting up to five or six years in every two decades, can limit or eliminate harvests and reduce livestock to starvation.

Plant and animal life. The Kalahari sandveld has often been called "thirstland" to distinguish it from true desert. Even in its southwestern corner, where there are some bare sand dunes, the vegetation is more characteristic of dry steppe than desert.

The general vegetation of the country is savanna grassland with yellow or light brown grass cover (turning green after rains) and woody plants. The savanna ranges from acacia shrub savanna in the southwest through acacia thornbush and tree savanna "parkland" into denser woodland and eventually forest as one moves north and east. Croton and Combretum tree savanna is found on the rocky hills of the eastern hardveld. Acacia tree savanna merges northward into mopane (African ironwood) savanna woodland. Mopane woodland covers most of the northern and eastern third of the country, with the exception of the open grasslands immediately surrounding the Okavango delta and Makgadikgadi Pans.

Animal life is extremely varied in a thirstland environment. About 150 species of mammals are found in Botswana. These range from 30 species of bats and 27 of rodents to more than 30 species of large mammals. Birdlife is prolific, with more than 460 species.

Botswana has a great variety of reptiles and amphibians, of which more than 200 species have been described in detail. The principal fish, in the rivers of the north, are tilapia (African bream), catfish, and the tigerfish, which is famous for its ferocious resistance to being caught on a line.

Settlement patterns. The human and livestock population of Botswana is concentrated around the hill ranges of the eastern hardveld and along the perennial rivers of the north. Approximately one-third of the population lives in scattered rural settlements, usually based around livestock pens. More than half the population lives in rural village settlements of more than 1,000 people, including traditional towns with up to 40,000 people.

Village patterns

The typical rural settlement and land use pattern of the eastern hardveld in the past may be characterized as having been concentric circles around a concentrated village nucleus. The family had a home base in the village, where the majority of its members spent most of the year. In the appropriate season it cultivated lands (fields) within one or two days' walk from the village. The family cattle, on the other hand, were pastured for most of the year at "cattle-posts" a number of days' walk from the village. Finally, beyond the cattle-posts there were hunting lands.

The villages and traditional towns of Botswana are still basically laid out around the *kgotla* (courtyard) and cattle kraal (corral) of traditional rulers and are subdivided into wards, each of which mimics the village or town plan with its own central *kgotla* and kraal. But, especially since the 1970s, traditional settlements have been sliced through by modern roads and facilities such as schools and offices, as well as shopping malls and bars. Traditional architecture of thatch roofing and clay walls has given way to corrugated metal roofing and brick walls.

Two of the seven larger towns of Botswana, Francistown (1897) and Lobatse (1902), originated as small urban centres on the railway for white farming communities. Both

began to develop in size and function in the 1950s, as employment in nonagricultural services expanded. Gaborone, the capital city, was founded in 1964; since then its population has grown to more than 150,000. Selebi-Phikwe (1971) and Jwaneng (1979) constitute the only substantial mining towns; the smaller diamond town of Orapa (1971) is under company control behind high security fences. The newest mining town, Sua (1991), is based on the soda-ash deposits of the eastern Makgadikgadi Pans.

The people. *Ethnic groups.* The dominant ethnic identity in Botswana is Tswana. The country's whole population is characterized as Batswana (singular, Motswana) whatever their ethnic origin. Though no attempt to count population by ethnic origin has been made since 1946, probably less than half the population is "ethnic Tswana" by origin. There are far greater numbers of ethnic Tswana in South Africa.

The Tswana

Tswana ethnic dominance ("Tswanadom") in Botswana can be dated to the eight Tswana states which ruled most of the area in the 19th century. Under British colonial rule, the populations of these states were given the official status of "tribes," a term still used officially today.

Within southeastern Botswana the other main ethnic identity besides Tswana, that of the Khalagari (Western Sotho), has become so incorporated as to be almost indistinguishable from the Tswana. Even their name is now usually rendered in the Tswana form as "Kgalagadi."

The Ngwato of east-central Botswana constitute the largest traditional "tribal" state but are probably less than one-fifth ethnic Tswana by origin. The major incorporated ethnic groups are Khalagari, Tswapong and Birwa (both Northern Sotho), and Kalanga (Western Shona). With larger numbers to the east in Zimbabwe, some Kalanga have resisted full incorporation.

The Tawana state of northwestern Botswana can be seen as the least successful in incorporating other ethnic groups. Most of its population is Yei and Mbukushu by origin, related to riverine peoples in the Caprivi Strip, Angola, and Zambia to the north. Smaller numbers of Mbanderu and Herero have greater numbers of close relatives across the border in Namibia. The Subiya along the Chobe, closely related to people in the Caprivi Strip and Zambia, were excluded from the Tawana "tribal" reserve by the British.

Small scattered groups of Khoisan people inhabit the southwestern districts of Botswana, as well as being incorporated with other ethnic groups. The Khoisan speak languages characterized as Khoe, or Khwe, and San. They include communities with their own headmen and livestock, as well as poorer groups employed by Tswana and white cattle farmers.

White settlement in Botswana, consisting of some Afrikaners and fewer English settled in border farms, totaled fewer than 3,000 people in the colonial period.

Religious groups. Christianity, brought by missionaries from the south such as David Livingstone, was established as the official religion of the eight Tswana states by the end of the 19th century. Indigenous religious and medical practices, notably respect for patriarchal ancestors, either declined or were assimilated within popular Christian beliefs. Allegiance to the old state churches, notably those of the Congregationalists (London Missionary Society), has declined since the 1950s. The two most active and popular churches are the Zion Christian church (based in South Africa) among the working class and the Roman Catholic church among the middle class. There are also numerous other small Zionist and Apostolic churches in rural villages, as well as United Reformed (Congregational and Methodist), Dutch Reformed, and Anglican churches, and predominantly expatriate Muslim, Quaker, Hindu, and Bahā'ī congregations.

Demographic trends. After six previous censuses of variable quality, Botswana had its first systematic national census in 1964. Total population was estimated at 550,000, with 35,000 absentees—mostly adult male workers in South Africa. Since 1964, the population has grown at about 3.4 percent a year, thus exceeding 1,000,000 in the early 1980s and doubling every 20 years. Meanwhile, the rate of labour migration abroad has been reduced by a combination of restrictions by South Africa and increased employment opportunities at home. Between the 1950s and the 1970s Botswana also provided a home and eventual citizenship for significant numbers of refugees from South Africa, Angola, and Zimbabwe.

Population growth

The age and gender composition of the country is weighted by an increasingly youthful population: approximately one-fifth are under age 5, and nearly half are younger than age 15. Females exceed males in age groups over 15; below that age the gender ratio is more or less equal because of recently reduced male infant mortality. The 1991 census showed improved life expectancy of 63.1 years at birth for females and 57 years for males, over the 1981 figures of 61.2 and 54.7 years, respectively. Botswana is also the first African country to experience a falling birth rate in response to improved life expectancy.

The economy. Botswana has a free market economy with a strong tradition of central government planning to provide infrastructure for private investment. The economy has grown rapidly since the mid-1960s, with the per capita gross domestic product increasing from less than $50 to more than $1,000 by the mid-1980s.

Less than a quarter of the adult work force is in formal paid employment. Relatively few rural households benefit from cattle sales: almost half of them have no cattle, and less than 10 percent own about half of the country's cattle (averaging 100 head each). Few households produce enough crops to cover even their own subsistence, let alone to sell on the market. Four out of five rural households survive on the income of a family member in town or abroad. That still leaves a significant number of rural households, usually female-headed, with no source of income known to statisticians.

State revenues reaped from mining development have been spent on basic rural infrastructure and welfare services and on schemes to subsidize the development of cattle and crop production, which have in general benefited the richer rural households. Trade unionism, restricted by legislation, is as yet underdeveloped in Botswana.

Resources. Diamonds, the major economic resource of the country, have been exploited on a large scale since 1970. They are mined from some of the world's largest diamond pipes at Orapa and Letlhakane, south of the Makgadikgadi Pans, and at Jwaneng in the southeastern sandveld. Nickel and copper have been mined at Selebi and Phikwe near the Motloutse River since 1974. Coal is mined for power generation at Morupule near Palapye. Botswana's other major proven mineral resources are salt and soda ash, which was fully exploited at Sua on the eastern Makgadikgadi Pans from 1991.

Diamonds

Surface water resources are limited to the wetlands and perennial rivers in the north and three major dam lakes at Gaborone, Shashe, and Mopipi (serving Orapa). Plans are under active consideration to canalize water through the Okavango wetlands toward Mopipi via a holding dam at Maun. Underground water is tapped in large quantities near Palapye and south of Gaborone.

Agriculture. Most of the population is partially engaged in agricultural production, but there is little land suitable for productive cultivation. Agricultural output constitutes less than one-tenth of gross national product, and most of that is in the form of livestock production for urban and export markets. Grain production (mostly sorghum and corn) has fallen short of national consumption for most of the 20th century, and foodstuffs from South Africa and Zimbabwe are Botswana's major import commodities. Fishing and forestry production are limited and largely confined to the extreme north.

Botswana, with terrain comparable to Texas or Australia, is traditionally seen as cattle country. Given sufficient water and pasture, and controls on the spread of hoof-and-mouth disease from wetland buffalo, it is a healthy environment for raising high-bulk, high-quality indigenous beef cattle. The government has invested heavily in disease prevention, modern abattoirs, and support services to cattle producers. Because of drought the national herd has fluctuated between one and three million head since the 1960s, with an export offtake of up to a quarter of a million per annum and a growing internal market. Various schemes—so far unsuccessful—have been attempted to

improve range management. Meanwhile, the main export market for beef, the European Community, has become increasingly unreliable. (Ne.P.)

Limits on development

Industry. Industrial development in Botswana has been limited by the high costs of power and water, the lack of appropriate management and labour skills, and the small domestic market. Manufacturing activity up to the 1980s largely consisted of meat processing at Lobatse in the south. In the early 1980s capital and textile production were transferred from Zimbabwe to nearby Francistown in Botswana, and diamond sorting and service industries grew in the booming capital city, Gaborone.

The national electric power grid, serving mines and eastern towns, is based on a large coal-powered generating station at Morupule near Palapye, supplemented by connections to the Zimbabwean and South African national grids.

Tourists are attracted to Botswana by relatively unpopulated and "remote" wetland and thirstland environments. Government policy is to limit the density and environmental impact of tourism through licensing of a limited number of high-cost safari companies.

Finance. The Botswana economy is regulated by a central bank, the Bank of Botswana, and a strong ministry of finance and development planning. There are two major multinational commercial banks, with branch operations that extend to village level. Botswana has had the unusual problems, for a developing country, of a government budget surplus running into billions of dollars and excess capital lying unutilized in private banks.

The budget surplus and bank liquidity were partially depleted by diversion into a construction boom in the late 1980s and early '90s, including infrastructure for new mining operations and military airports. A small stock exchange has been set up. The economy, from diamonds to nickel-copper to soda ash and construction, remains dominated by South Africa's De Beers–Anglo American Corporation conglomerate.

Trade. Botswana sends the great bulk of its exports to the world market beyond Africa, mainly to Europe and North America. It takes nearly three-fourths of its imports from South Africa, its neighbour with a gross national product vastly larger than that of Botswana. Imports consist of machinery and transport equipment, food products, and consumer goods, often manufactured or serviced by multinational companies based in South Africa. From Zimbabwe, Botswana imports mainly food products. Other imports from the rest of the world consist largely of high-technology equipment.

Botswana is joined in a customs union with South Africa, Lesotho, Swaziland, and Namibia (the Southern African Customs Union) and, along with the other countries of southern Africa, is a member of the Southern African Development Community (SADC). Domestic trade patterns within Botswana are dominated by large, mostly foreign-owned wholesale operations and large foreign retailers in urban areas, though there is also an increasing proliferation of small stores owned by citizens.

Transport. The 400-mile railway along the eastern side of the country was completed in 1897, linking South Africa and Zimbabwe, but had limited impact on the Botswana economy until the 1970s, when the first branch lines were opened to serve mining areas. At independence in 1966, there were only a few miles of paved roads—all inside town boundaries. Since then, the major towns have been linked by paved main highways. Most of the sandveld, however, is accessible only to four-wheel-drive vehicles.

International air traffic in Botswana, though dating to 1919, was limited until the opening up of the Sir Seretse Khama Airport at Gaborone in 1984. Gaborone is now served by British and French airlines as well as by regional airlines and the national parastatal airline, Air Botswana.

Administration and social conditions. *Government.* Botswana is a unitary state with a multiparty parliamentary system and an executive presidency. Since independence, Botswana has held free elections every five years, a relatively uncorrupt bureaucracy, and judicial respect for human rights and the rule of law. The government has also distributed increasing resources widely if not always equally among the people.

The National Assembly

Parliament consists of a National Assembly of elected members (elected by universal adult suffrage in single-member constituencies) and a handful of ex officio members nominated by the ruling political party. There is also a House of Chiefs, with an advisory role on matters of legislation pertaining to tribal law and custom.

The ruling party, first elected in 1965 and reelected at five-year intervals since then, is the Botswana Democratic Party. Its overwhelming majorities in elections have been based on rural support; opposition parties have drawn their strength generally from urban areas. The Botswana People's Party was the main opposition in the 1960s, when urban areas were small. Since then the Botswana National Front has grown in strength, holding the majority of the city council of Gaborone and both of Gaborone's parliamentary seats.

Local councils, rural and urban, have been elected since 1969 simultaneously with national parliamentary elections. The power of local councils is limited by the right of the central government to nominate ex officio voting members and by central government appointment of supervisory district commissioners and planning staff.

The evolving political and economic alignments of Botswana's foreign policy are indicated by the countries to which it has sent resident ambassadors—originally the United States, the United Kingdom, and Zambia in the 1960s, followed by Belgium, Zimbabwe, and Sweden in the 1980s and by Namibia, Russia, and China in the early 1990s. Full diplomatic relations were established with South Africa in 1994.

Education. Since independence, enrollment at all levels of education has increased steadily. Enrollments in primary education are still lower in the remote western and northwestern districts than in other areas, however, as poorer non-Tswana children often miss out on school.

International interest has been aroused by an alternative system of education, integrating vocational skills into the secondary curriculum, developed by the educationist Patrick van Rensburg at Swaneng Hill near Serowe. But "education-with-development" has had little impact on the general curriculum within Botswana's schools.

A university campus in Gaborone, founded in 1976, became the University of Botswana in 1982. Officially, more than three-fourths of the population is considered literate, although this is probably an overestimate. Rural literacy rates are higher in the east and northeast and lower in the west and northwest. More women than men are literate, as many boys traditionally are employed in cattle herding rather than being sent to school.

Health and welfare. Botswana has a dry and warm climate generally conducive to good health. The incidence of tropical diseases—notably malaria, bilharzia (a parasitic disease), and sleeping sickness—is limited by the environment and lack of surface water. The most common fatal diseases are intestinal (diarrheal and digestive diseases) and respiratory (pneumonia and tuberculosis).

The main threats to health are diseases associated with changing lifestyle, particularly diet. There has been increased incidence of high blood pressure, strokes, and heart disease, as well as dental caries in older children. The spread of AIDS has had a devastating effect in Botswana, where the rate of infection has been one of the highest in the world; by 2000 more than one-third of the adult population was infected with HIV, and the growing number of AIDS orphans loomed as a serious social problem.

Health policy

Since 1973, government health policy has been based on the provision of basic health services in the form of health posts in every village with a population of more than 500 and clinics in every area with more than 4,000 in a nine-mile radius. Since the late 1980s there has also been extensive investment in two large national referral hospitals, at Gaborone and Francistown.

The use of government health services is free of charge. There are also a number of Western-certified physicians in private practice and many traditional herbalists, healers, and diviners. (Ne.P./Ed.)

Cultural life. The cultural life of Botswana reflects the

dual heritage and intermingling of Tswana and English cultural domination. The two languages and cultures are subtly mixed and alternated in urban and official situations.

Western dress has been general among people in Botswana, except at the poorest level, since the late 19th century. Common diet and cuisine consist of sorghum and corn porridge, beans and pulses and traditional spinach, supplemented by tomato, potato, onion, and cabbage usually purchased from stores. Meat consumption has become more common with the opening of small butcheries selling beef. Traditional foods include dried *phane* caterpillars from mopane woodland, eaten as relish or snacks, fruits such as the wild *morula* plum, and beer made from sorghum or millet.

Families in rural villages live in traditional compounds, usually with two or three small houses of cylindrical clay walls and conical thatch roofs, set around an open fireplace and surrounded by low clay walls. Most recent houses are square with metal roofs, while many houses in the northwest are made of reed.

Rites of burial, marriage, and birth have been adapted to Christianity but remain extremely important in Botswana life.

Traditional arts

Traditional music, based on stringed instruments, and dance generally declined during the colonial period. After independence there was a revival of interest, particularly in music on the radio.

The best-known modern art form incorporating traditional craftwork is basketry—most of it from northwestern Botswana—which is widely exported overseas.

The author Bessie Head (1937–86) wrote novels in English that reflect the contemporary realities and history of Serowe. The publishing of fiction in Setswana was revived in the 1980s.

There is a national museum and art gallery in Gaborone and an increasing number of district museums founded by local community initiative. A national learned and scientific society, the Botswana Society, holds regular lectures and publishes an annual journal and books.

Football (soccer) is the national sport, played on fields and in stadiums across the country every Saturday.

The government issues a free daily newspaper, mostly in English, and runs a radio service, mostly in Setswana. There are also several separate private weekly newspapers, with circulation in eastern towns, and private local television stations, mostly relaying broadcasts from neighbouring countries. There is no government censorship. During the 1980s three multinational publishers set up branches to generate published materials for schools.

For statistical data on the land and people of Botswana, see the *Britannica World Data* section in the BRITANNICA BOOK OF THE YEAR.

HISTORY

The history of Botswana is in general the history of the Kalahari area, intermediate between the more populated savanna of the north and east and the less populated steppe of the south and west. Although reduced to a peripheral role in southern Africa for most of the 20th century, at other times Botswana has been a central area of historical development.

Early pastoral and farming peoples. *Khoisan-speaking hunters and herders.* People speaking Khoisan (Khoe and San) languages have lived in Botswana for many thousands of years. Depression Shelter in the Tsodilo Hills has evidence of continuous Khoisan occupation from about 17,000 BC to about AD 1650. During the final centuries of the last millennium before Christ, some of the Khoi (Tshu-khwe) people of northern Botswana converted to pastoralism, herding their cattle and sheep on the rich pastures revealed by the retreating lakes and wetlands.

Bantu-speaking farmers. Meanwhile, the farming of grain crops, and the speaking of Bantu languages, were carried gradually southward from the Equator. By about 20 BC such farmers were making and using iron tools on the upper Zambezi.

The earliest dated Iron Age site in Botswana is an iron-smelting furnace in the Tswapong Hills near Palapye, dated about AD 190 and probably associated with Iron Age farmers from the Limpopo valley. The remains of small beehive-shaped houses made of grass matting, occupied by early Iron Age farmers around Molepolole, have been dated from about AD 420. There is also evidence of early farming settlement west of the Okavango delta, in the Tsodilo Hills alongside Khoisan hunter and pastoralist sites, dated from about AD 550. Archaeologists therefore have difficulty in interpreting the hundreds of rock paintings in the Tsodilo Hills, which were once assumed to be painted by "Bushman" (San) hunters remote from all pastoralist and farmer contact.

Iron Age states and chiefdoms. *Eastern states and chiefdoms.* From about AD 1095 southeastern Botswana saw the rise of a new culture, characterized by a site on Moritsane hill near Gabane. The Moritsane culture is historically associated with the Khalagari (Kgalagadi) chiefdoms, the westernmost dialect group of Sotho (or Sotho-Tswana) speakers.

The Toutswe state

The area within 50 or 60 miles of Serowe saw a thriving farming culture, dominated by rulers living on Toutswe hill, between about the 7th and 13th centuries. The prosperity of the state was based on cattle herding, with large corrals in the capital town and in scores of smaller hilltop villages. (Ancient cattle corrals are identified by the peculiar grass growing on them.) The Toutswe people also hunted westward into the Kalahari and traded eastward with the Limpopo.

The Toutswe state appears to have been conquered by its neighbour, the Mapungubwe state, centred on a hill at the Limpopo-Shashi confluence, in the 13th century. But Mapungubwe's triumph was short-lived, as it was superseded by the new state of Great Zimbabwe, north of the Limpopo River. Great Zimbabwe's successor from about 1450, the Butua state based at Khami (Kame) near Bulawayo in western Zimbabwe, controlled trade in salt and hunting dogs from the eastern Makgadikgadi Pans, around which it built stone-walled command posts.

Western chiefdoms. From about AD 850 farmers from the upper Zambezi, ancestors of the Mbukushu and Yei peoples, reached as far south and west as the Tsodilo Hills (Nqoma). The oral traditions of Herero and Mbanderu pastoralists, west of the Okavango, relate how they were split apart from their Mbandu parent stock by 17th-century Tswana cattle-raiding from the south.

Rise of Tswanadom. During the 13th and 14th centuries AD a number of powerful dynasties began to emerge among the Tswana in the western Transvaal region. Rolong chiefdoms spread westward over lands controlled by Khalagari peoples. Khalagari chiefdoms either accepted Rolong rulers or moved westward across the Kalahari.

The main Tswana dynasties of the Hurutshe, Kwena, and Kgatla were derived from the Phofu dynasty, which broke up in its home in the western Transvaal region in the 16th century. The archaeology of the Transvaal region shows that, after about 1700, stone-walled villages and some large towns developed on hills. These states were probably competing for cattle wealth and subject populations, for control of hunting and mineral tribute, and for control of trade with the east coast.

The Ngwaketse chiefdom

Growth of Tswana states. Kwena and Hurutshe migrants founded the Ngwaketse chiefdom among the Khalagari-Rolong in southeastern Botswana by 1795. After 1750 this chiefdom grew into a powerful military state controlling Kalahari hunting and cattle raiding and copper production west of Kanye. Meanwhile, other Kwena had settled around Molepolole, and a group of those Kwena thenceforth called Ngwato settled farther north at Shoshong. By about 1795 a group of Ngwato, called the Tawana, had even founded a state as far northwest as Lake Ngami.

Times of war. From about 1750, trading and raiding for ivory, cattle, and slaves spread inland from the coasts of Mozambique, the Cape Colony, and Angola. By 1800, raiders from the Cape had begun to attack the Ngwaketse. By 1824 the Ngwaketse were being attacked by the Kololo, a military nation on the move that had been expelled northwestward by raiders from the east. The great Ngwaketse warrior king Makaba II was killed, but the Kololo were pushed farther north by a counterattack in 1826.

The Kololo moved through Shoshong to the Boteti River, expelling the Tawana northward. In about 1835 the Kololo settled on the Chobe River, extending their power to the upper Zambezi, until their final defeat there by their Lozi subjects in 1864. The Kololo were followed by the Ndebele, a military nation led by Mzilikazi, who settled in the Butua area of western Zimbabwe in 1838–40, after the local Rozvi state was conquered.

Prosperous trading states. The Tswana states of the Ngwaketse, Kwena, Ngwato, and Tawana were reconstituted in the 1840s after the wars ended. The states competed with each other to benefit from the increasing trade in ivory and ostrich feathers being carried by wagons down new roads to the Cape Colony in the south. Those roads also brought Christian missionaries to Botswana and Boer trekkers who settled in the Transvaal to the east.

The most remarkable Tswana king of this period was Sechele (ruled 1829–92) of the Kwena around Molepolole. He allied himself with British traders and missionaries and was baptized by David Livingstone. He also fought the Boers, who tried to seize people who fled from the Transvaal to join Sechele's state. But by the later 1870s the Kwena had lost control of trade to the Ngwato under Khama III (ruled 1872–73; 1875–1923), whose power extended to the frontiers of the Tawana in the northwest, the Lozi in the north, and Ndebele in the northeast.

British protectorate. White miners and prospectors flooded Botswana in 1867–69 to start deep gold mining at Tati near Francistown. But the gold rush was short-lived, and the diamond mines at Kimberley south of Botswana became southern Africa's first great industrial area from 1871. Migrant labourers from Botswana and countries farther north streamed to Kimberley and later to the gold mines of the Transvaal.

The "Scramble for Africa" in the 1880s resulted in the German colonization of South West Africa. The new German colony threatened to join across the Kalahari with the independent Boer republic of the Transvaal. The British in the Cape Colony responded by using their missionary and trade connections with the Tswana states to keep the roads through Botswana open for British expansion to Zimbabwe and the Zambezi. In 1885 the British proclaimed a protectorate over their Tswana allies and the Kalahari as far north as the Ngwato; the protectorate was extended to the Tawana and the Chobe River in 1890.

Threats of incorporation

In 1890 British colonial expansion was privatized in the form of the British South Africa Company, which used the road through the Bechuanaland Protectorate to colonize what would soon be called Rhodesia. But the protectorate itself remained under the British crown, and white settlement remained restricted to a few border areas, after an attempt to hand it over to the company was foiled by a delegation of three Tswana kings to London in 1895. The kings, however, had to concede to the company the right to build a railway to Rhodesia through their lands.

The British government continued to regard the protectorate as a temporary expedient, until it could be handed over to Rhodesia or, after 1910, to the new Union of South Africa. Hence the administrative capital remained at Mafikeng—actually outside the protectorate's borders in South Africa—from 1895 until 1964. Investment and administrative development within the territory were kept to a minimum. It declined into a mere appendage of South Africa, for which it provided migrant labour and the rail transit route to Rhodesia. Short-lived attempts to reform administration and to initiate mining and agricultural development in the 1930s were hotly disputed by leading Tswana chiefs, on the grounds that they would only enhance colonial control and white settlement. The territory remained divided into eight largely self-administering "tribal" reserves and five white settler farm blocks, with the remainder classified as crown (*i.e.*, state) lands.

The extent of the Bechuanaland Protectorate's subordination to the interests of South Africa was revealed in 1950. In a case that caused political controversy in Britain and the empire, the British government barred Seretse Khama from the chieftainship of the Ngwato and exiled him from Botswana for six years. This, as secret documents have since confirmed, was in order to satisfy the South African government, which objected to Seretse Khama's marriage to a white Englishwoman at a time when racial segregation was being reinforced in South Africa under apartheid.

Advance to independence. From the late 1950s it became clear that Bechuanaland could no longer be handed over to South Africa and must be developed toward political and economic self-sufficiency. The supporters of Seretse Khama began to organize political movements from 1952, and there was a nationalist spirit even among older, more ethnic-based leaders. A legislative council was eventually set up in 1961 after limited national elections. The Bechuanaland People's Party was founded in 1960, and the Bechuanaland Democratic Party (BDP)—led by Seretse Khama—in 1962.

Founding of political parties

After long resistance to constitutional advance before economic development could pay for it, the British began to push political change in 1964. A new administrative capital was rapidly built at Gaborone. Bechuanaland became self-governing in 1965, under an elected BDP government with Seretse Khama as prime minister. In 1966 the country became the Republic of Botswana, with Seretse Khama as its first president.

For its first five years of political independence, Botswana remained financially dependent on Britain to cover the full cost of administration and development. The planning and execution of economic development took off in 1967–71 after the discovery of diamonds at Orapa. The essential precondition for this was renegotiation of the customs union with South Africa, so that state revenue would benefit from rising capital imports and mineral exports rather than remain at a fixed percentage of total customs union income. This renegotiation was achieved in 1969.

Botswana since independence. From 1969 Botswana began to play a more significant role in international politics, putting itself forward as a nonracial, liberal democratic alternative to South African apartheid. South Africa was obliged to step down from its objections to Botswana's building a road, with U.S. aid, to Zambia, avoiding the old railway and road route through Rhodesia. From 1974 Botswana was—together with Zambia and Tanzania and later Mozambique and Angola—one of the "Frontline States" seeking to bring majority rule to Rhodesia, Namibia, and South Africa.

Economic and political growth

With an economy growing between 12 and 13 percent annually, Botswana extended basic infrastructure for mining development and basic social services for its population. More diamond mines were opened, on relatively favourable terms of income to the state, and less economically successful nickel and copper mining commenced at Selebi-Phikwe. The BDP was consistently reelected with a large majority, though the Botswana National Front (BNF; founded 1965) became a significant threat after 1969, when traditional leaders joined the socialists in BNF ranks attacking the government's policies.

The late 1970s saw civil war in Rhodesia and urban insurrection in South Africa, from which refugees flooded into Botswana. Botswana played a part in the final settlement of the Rhodesian war, resulting in independence for Rhodesia (now called Zimbabwe) in 1980. Its main contribution, however, was in formulating the Southern African Development Community (SADC) to look to the future of the region. The idea behind SADC, as expounded by Seretse Khama, was to coordinate disparate economies rather than to create a unified market in southern Africa. All the states of southern Africa, except South Africa and Namibia, formed SADC in 1980, to work together in developing identified sectors of their economies, particularly the transport network to the ports of Mozambique.

Seretse Khama died in 1980 and was succeeded by Quett Masire, who had been his deputy since 1965. The economy continued to expand rapidly after a temporary slump in diamond and beef exports at the beginning of the 1980s. Meanwhile, the country experienced the problems of an increasing gap between urban rich and rural poor.

Between 1984 and 1990, Botswana suffered from upheavals in South Africa when South African troops raided the Frontline States. A new era in southern African relations has opened since the independence of Namibia in

1990 and political changes in South Africa in 1994. Masire retired from politics in March 1998 and was succeeded by his vice president, Festus Mogae, as required by the constitution. General elections held in 1999 kept the BDP in power. Botswana's major problem at the beginning of the 21st century was its large number of HIV/AIDS cases, estimated to include nearly two-fifths of the population. (Ne.P.)

For later developments in the history of Botswana, see the BRITANNICA BOOK OF THE YEAR.

Lesotho

The Kingdom of Lesotho in southern Africa has an area of 11,720 square miles (30,355 square kilometres). Like only two other independent states in the world (Vatican City and the Republic of San Marino), Lesotho is completely encircled by a single country on which it must depend exclusively for access to the outside world. It forms an enclave within the Republic of South Africa, bordering on three of the latter's provinces—KwaZulu/Natal, Free State, and Eastern. This physical dependence on its neighbour is further accentuated by Lesotho's own grave lack of resources, which makes it necessary for one-fourth to one-half of the labour force to live and work, mainly as migrants, in South Africa. For this reason, Lesotho is sometimes described as a "hostage state." It is a member of the Commonwealth and of the African Union, and it is a signatory of the Lomé Convention. Before its independence on Oct. 4, 1966, it was one of the three British High Commission Territories, the other two being Bechuanaland (now Botswana) and Swaziland.

Lesotho is the name of the country, and Basotho (Sotho) is the name of its people; a single individual is referred to as a Mosotho. Sesotho is the language. The capital of Lesotho is Maseru.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Two-thirds of the country consists of mountains. The highest peak, Mount Ntlenyana, is 11,424 feet (3,482 metres) above sea level. The Drakensberg range forms the eastern boundary with KwaZulu/Natal. The Maloti spurs, running north and south, join the main range in the north, where they form a plateau between 9,000 and 10,500 feet in elevation. This plateau is the source of South Africa's two largest rivers—the eastward-flowing Tugela and the westward-flowing Orange—as well as tributaries of the Caledon (Mohokare). The foothills, with elevations averaging between 6,000 and 7,000 feet, descend in undulating slopes to the west, where the lowlands bordering Free State average some 5,000 to 6,000 feet in elevation.

The plateau

The mountain soils are of basaltic origin and are shallow but rich. The soils of the lowlands derive mainly from the underlying sandstone. Extensive erosion has severely damaged soils throughout the country.

Climate. Precipitation, brought by the prevailing winds, occurs mostly between October and April and is variable; the annual average is about 28 inches (710 millimetres), with amounts decreasing from east to west. Although droughts are rare, their periodic occurrence is devastating to the country. Temperatures in the lowlands vary from 90° F (32° C) in the summer to 20° F (−7° C) in the winter. In the highlands the temperature range is much wider, and readings below 0° F (−18° C) are not unusual. Frost occurs widely in the winter, when the Maloti are usually snowcapped. Hail is a frequent hazard during the summer.

Plant and animal life. Overgrazing, overutilization, and soil erosion have severely depleted and altered the grasslands, the reedbeds, and the woody bush on the protected slopes and led to the invasion of unpalatable vegetation over wide areas. Indigenous trees include the Cape willow (*Salix capensis*) and wild olive, and the wild willow and white poplar have been introduced. Afforestation schemes (the Woodlot Project) have been attempted. One of the eight indigenous species of aloe is the endemic spiral aloe (*Aloe polyphylla*).

Large mammals have been eradicated, but smaller antelope and hares can be found, and the hyrax, or dassie, is common. Lesotho is the last stronghold in southern Africa of the magnificent bearded vulture, or lammergeyer (*Gypaetus barbatus*). Rivers contain yellowfish, the rare Maloti minnow (*Oreodaimon quathlambae*) is of interest, and trout have been introduced.

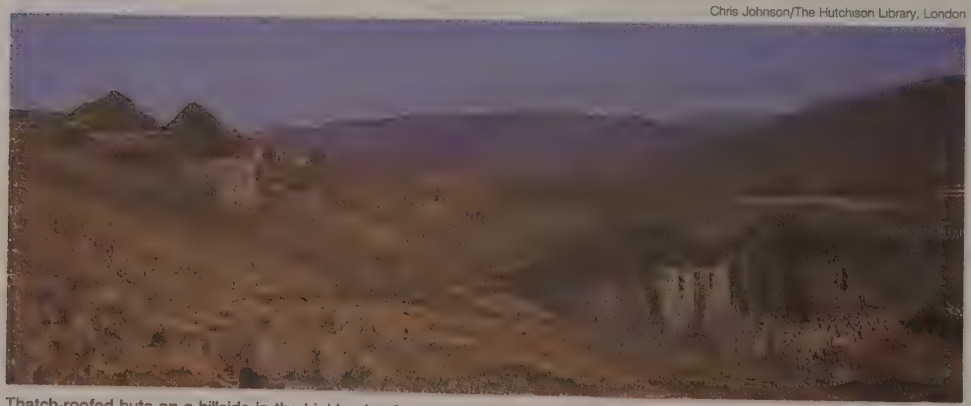
Settlement patterns. Although not permanently inhabited, the mountain grasslands on the slopes of the high plateau as well as in the valleys provide summer grazing for sheep and cattle, which are tended by herders in isolated cattle posts. Some of the deep valleys, like the Senqunyane, produce crops of wheat, peas, and beans. One-half of the population lives in the lowlands, which form a narrow corridor, averaging only 25 miles (40 kilometres) in width, along the Caledon River.

The Basotho combine modern and traditional ways to an unusual degree; this provides continuity in a society that is disrupted by a system of migratory labour. Although undermined by political developments since independence, traditional authority is still exercised through a system of chieftaincy extending from the king through the chiefs to the village level. Their authority rests largely on their responsibility for the working and distribution of the land, although in certain areas this authority has been reduced by the Land Act of 1979.

Since independence there has been considerable movement toward the capital city, Maseru, the population of which doubled between 1966 and 1976. It now consists of a developed modern city centre surrounded by suburbs for the large bureaucracy and for foreign aid and development personnel, with informal settlements on the periphery. The Maseru Municipal Council was constituted in 1988.

Social cohesion is strengthened by the persistence of clan and family loyalties. Families and clans still cluster together as units in the numerous small rural villages. There are no large towns in the country. The villages range in size from one large family to four or five extended families, with an average of 30 to 50 immediate families. The villages are often picturesque, offering fine views of the rocky highlands; on the plains they are often surrounded by aloes

Chris Johnson/The Hutchison Library, London



Thatch-roofed huts on a hillside in the highlands of central Lesotho, near Semonkong

and trees, and the walls and doors of many houses are covered with patterned designs. The villages themselves consist of clusters of circular or rectangular huts solidly built of turf, Kimberley brick (unburned clay), or dressed stone, mostly with thatched roofs; more recently, however, corrugated iron has become a popular roofing material.

The average household usually has two or three huts, the larger one being used as a living and dining area and as the parents' bedroom; the smaller ones are used for kitchen and storage purposes and as sleeping quarters for the children. The hut of the chief, or headman, is usually in the centre of the village, flanked by that of the principal wife and ringed by those of the junior wives. The *lekhotla* (open court) is in front of the chief's hut; beside it are the kraals (enclosures) for the cattle and stables for horses. Village life centres largely on the fields, the chief's court, the kraals, the school, the church, and the initiation lodge. Circumcision forms an integral part of the ritualized initiation ceremonies that train boys to take their place as full members of the family, clan, and nation—the three centres of social cohesion. Young boys still spend a large part of their lives as herdsmen, while women and young girls do much of the hard work in the fields, a practical necessity because the able men are usually absent, although they contrive to return home briefly for the plowing or the harvest.

Initiation ceremonies

Since independence the building of hard-top roads in the lowlands and the opening of good-quality gravel roads into the highlands, together with the availability of four-wheel-drive road vehicles and domestic flights, have done much to break down the isolation of the more remote villages. However, the small, sturdy Basotho pony is still widely used in the rural areas and is often the only means of rural transport. Because of the sharp variations in climate, both men and women invariably wear blankets, which they use as cloaks; a great deal of care is taken in choosing a blanket, which, especially for the men, is usually multicoloured. Men and women also wear the typical Sotho hat, which is woven from reed into conical shapes, with an unusual topknot.

The people. *Ethnic groups.* The Basotho are members of the Southern Sotho linguistic group, originally united by a common loyalty to the royal house of Moshoeshoe (Mshweshwe), of the Moketeli branch of the Kwena lineage. Internally, cleavages between different chiefdoms (and within the royal lineage itself) have had political significance, but externally the sense of Basotho nationhood and cultural unity remains strong.

There are a few thousand nationals of Asian or Coloured (mixed race) descent, but the European community is dominated by expatriate teachers, missionaries, aid workers, technicians, and development advisers.

Emigration

Because the country is severely overpopulated, both temporary and permanent emigration has taken place. No exact figures exist for the number of Basotho working or living in South Africa. The great majority of the migrant workers are men under the age of 40.

Religion. The majority of Basotho profess Christianity and are members of the Roman Catholic church, the Lesotho Evangelical church, or the Anglican church. Independent churches are also present, together with Zionist sects. Traditional beliefs are still held but are of declining significance.

Demographic trends. The population density of Lesotho is high for an African state, despite the country's mountainous terrain, but the population is growing at a much slower rate than that of most other states. Most of the population live in the western lowlands, which have a population density four times higher than the country as a whole.

Labour migration dominates the life of the Basotho, with more than one-half of the adult male labour force working in South Africa.

The economy. Lesotho is a poor country with few natural resources; these are certainly insufficient for even the present population. Its economy could not be sustained at all without such benefits as it derives from South Africa, with which Lesotho forms part of a customs union and shares an integrated communications system. Lesotho also depends wholly on South Africa for the export of its surplus working population.

Economic links to South Africa

The government is the largest employer of labour in the country, with a large share of its annual budget being made up of payments to its public employees. Three forms of direct taxation are levied: a basic tax on all adult males; a graded tax on all income earners; and an income tax. There is also a general sales tax.

Agriculture. Only 10 percent of Lesotho is arable, but agriculture forms the primary occupation and is the single largest contributor to the gross domestic product (GDP). However, its contribution has declined to less than a quarter of total GDP. The most important agricultural products are corn (maize), sorghum, wheat, beans, and peas. Cattle products have been exported, but cattle have more social than commercial value. Wool and mohair are produced and exported. Agricultural development projects are funded by a wide range of agencies, including the World Bank. None, however, have been able to reverse the steady decline in agricultural production since the mid-1960s.

Industry. Geologic surveys have so far shown little promise of mineral wealth, although kimberlite pipes in the highlands do produce diamonds. The capital-intensive mine at Lestseng-la Terai, opened by DeBeers in 1977, was closed in 1982.

Development of industry and manufacturing has been the responsibility of the Lesotho National Development Corporation and the Basotho Enterprises Development Corporation. Three industrial estates operate small projects; among their products are candles, ceramics, furniture, and jewelry, and they include weaving, canning, and diamond-polishing concerns. Urban development has stimulated the construction, catering, and service sectors. Although the manufacturing and construction sectors have grown markedly, they provide less than 10 percent of all jobs. Together they contribute some 25 percent to the GDP, while manufacturing contributes half of all export earnings.

The Highlands Water Scheme

The Highlands Water Scheme is a significant project for the future of the region as a whole and Lesotho in particular. Through this project the headwaters of the Orange River in the deep valleys of the Lesotho highlands are to be dammed, and the immense volume of water this will accumulate will be drained off and piped to the industrial regions of South Africa. Included in the plan is a hydroelectric scheme for Lesotho. It is a long-term project that will take at least 30 years to complete in four stages. The project is run by a Joint Standing Commission and has attracted backing from the World Bank, the European Economic Community, and a number of other development agencies.

Tourism. The mountain scenery of Lesotho has potential for tourism. Roads and pony trails have been developed, trout streams stocked, and hotels built in Maseru and other places of interest to exploit this market. Tourism in Lesotho will receive a considerable boost with the development of the Highlands Water Scheme.

Finance. Lesotho has been a member since 1986 of the Tripartite Monetary Area, comprising Lesotho, Swaziland, South Africa, and Namibia. Its currency, the loti (plural, maloti), is fixed to the South African rand. Lesotho is a member of the South African Customs Union, and payments from the union make up a substantial proportion of government revenue. An economic program negotiated with the World Bank led to the granting of a substantial IMF loan under its structural adjustment facility in 1988.

Trade. Lesotho has a large and growing trade deficit. Most trade is with South Africa. The large deficit is offset by the remittances of Lesotho's migrant workers, by external aid, and by receipts from the customs union in agreement with South Africa, Swaziland, and Botswana.

Transportation. A main road runs along the western and southern boundary, and a mountain road from Maseru reaches into the interior. These two main arteries are served by short-distance feeder roads. Villages in the mountains are served by bridle paths. A one-mile railway line links the capital to the South African transport network.

Considerable use is made of light aircraft for passengers

and for transporting mail and freight to the interior. An international airport south of Maseru became operational in 1986.

Administration and social conditions. *Government.* In July 1991 a new constitution was approved by a constituent assembly. Promulgated after the March 1993 general election, it calls for a bicameral parliamentary system with the king as hereditary head of state. The National Assembly has 65 directly elected members; the Senate has 33 members (22 principal chiefs and 11 appointees).

The old constitution was suspended following the disputed 1970 election, in which the opposition claimed victory over the ruling Basotho National Party (BNP). The legislature was replaced by an appointed 93-member interim assembly that included the 33 members of the Senate. In 1973 a new National Assembly, consisting of the 22 principal chiefs and 71 members from the BNP and other parties, was appointed. It was dissolved in 1986, and elections were not held again until 1993.

Basotho National Party

Justice. The legal system is based on Roman-Dutch law, with elements of British and customary law playing a role. There are local and central courts, judicial commissioners' courts, subordinate courts, and a Court of Appeal, with the High Court as a superior court of record.

Education. Although Lesotho has one of the highest literacy rates in Africa, the educational structure does not have great depth, and only a small percentage of students have the resources and skills to reach the higher levels. Education remains largely the responsibility of the churches, under the supervision of the Ministry of Education. Considerable funding and expertise have contributed to the development of a more relevant and adequate system, but some unbalanced features remain, with the National University of Lesotho, for example, absorbing about one-fifth of recurrent expenditure. There are also agricultural and educational training centres.

Health and welfare. The country's healthy climate contributes to the comparatively low rate of sickness. The main incidence of ill health is the result of food-deficiency diseases, venereal disease, chronic rheumatism, infections of the respiratory tract, and dyspepsia. There are several hospitals, about half of which are operated by the government, and a number of clinics for maternity, child health, and venereal diseases, as well as a few health centres and dispensaries. In recent years the demands of the IMF structural adjustment program have threatened to reduce the capacity of some of the country's leading health programs and institutions.

Cultural life. The contradictions created by Lesotho's political independence and economic dependence are reflected in the cultural life of the country. Despite increasing urbanization and the growth of modern institutions and bureaucracy (including the experience of many Basotho in industry), the overall objective is to build the rural homestead and perpetuate traditional institutions. The paramount chief and the system of chieftaincy remain a focus of loyalty, although they have been increasingly discredited in recent years. Institutions such as the initiation schools, which perpetuate traditional values, are still significant although they are changing in structure and declining in importance.

Changes since independence

Although rural conservatism remains a feature, the pace of change in Lesotho has been marked since independence. With the process of democratization advancing in neighbouring South Africa and the development of the Highlands Water Scheme, these changes will intensify.

Nonetheless the historical traditions and legacy of Moshoeshoe I, founder of the nation, remain strong, and there is national pride in Lesotho's history of resistance, the role of the Basotho in building modern southern Africa, and the achievements of its writers (Thomas Mofolo) and composers (Joshua Pulumo Mohapeloa). The newspaper *Leselinyana La Lesotho* has been published for more than a century, and the printing presses of the mission stations, such as the Morija Press, made a substantial contribution to the educational literature of southern Africa.

Village life is dominated by basic agricultural tasks, with heavy responsibilities falling on women. Craftwork is still practiced in the villages and includes pottery and grass-weaving (which is most obviously seen in the traditional Basotho hat), and the walls of houses are often attractively decorated.

Herders still play the traditional *letsiba,* and dances such as the "gum-boot dance" and the *lefela* demonstrate the influence of the experience of labour migrancy on traditional forms of cultural expression.

The radio has done much to improve communication in Lesotho, where broadcasts from South African stations can be received; the British Broadcasting Corporation (BBC) has built a regional transmitter. Broadcasts in Sesotho are received from the Lesotho National Broadcasting Service.

For statistical data on the land and people of Lesotho, see the *Britannica World Data* section in the BRITANNICA BOOK OF THE YEAR. (Co.L./J.J.Gu.)

HISTORY

The territory now known as Lesotho has been occupied from the dawn of human history and during the past few thousand years by Late Stone Age San hunter-gatherers. From about the 16th century, African farmers—the ancestors of the present population—moved across the grasslands of southern Africa and settled in the fertile valleys of the Caledon River, where they came to dominate the San hunters of the region. These stock-keeping agriculturalists belonged to the large Sotho group and were divided into numerous clans that formed the nucleus of chiefdoms whose members occupied villages and the associated arable and grazing land.

The Basotho kingdom (1824–69). The violent upheavals of the early 19th century among the chiefdoms of southern Africa became particularly intense in Lesotho in the 1820s. During this violence, known as the *lifaqane* ("hammering"; also spelled *difaqane*), the members of many chiefdoms were annihilated, dispersed, or incorporated into reorganized, larger chiefdoms in strategically advantageous areas; these were under new leaders who had the ability to offer greater protection.

One such man was Moshoeshoe (Mshweshwe; b. *c.* 1786) of the Moketeli, a minor lineage of the Kwena (Bakwena). In 1824 he occupied the mountain Thaba Bosiu ("Mountain of the Night"), the defensive centre from which he incorporated many other individuals, lineages, and chiefdoms into what became the kingdom of the Basotho. Moshoeshoe was a man of remarkable political and diplomatic skill. By cooperating with other chiefdoms and extending the influence of his own lineage, he was able to create a sense of Basotho identity and unity with which to confront the external forces that soon posed a threat to their autonomy and independence. He was also aware of the need to acquire the skills of the increasing number of farmers, settlers, hunters, and adventurers moving across his borders from the south if he was to counter the challenges they posed. He therefore welcomed the missionaries from the Paris Evangelical Missionary Society when they arrived at Thaba Bosiu in 1833 as a source of information about the rest of the world, relating its ideas and material achievements. He placed them in strategically important parts of the kingdom, where they gave the Basotho their first experience of Christianity, literacy, and commodity production.

Moshoeshoe

External influence was changed to external threat in the late 1830s when large numbers of Boer trekkers from the Cape Colony settled on the western margins of the kingdom and began to contest the right of the Basotho to their land. The next 30 years were characterized by conflict between the Basotho and the Boers, which at times broke out into overt warfare and led ultimately to the loss of most Basotho land to the west of the Caledon River. The third party in these wars was the British, to whom Moshoeshoe appealed for intervention. The British governors of the Cape redrew the boundaries between the Boers and the Basotho on a number of occasions but failed to resolve the conflict.

After devastating wars in the late 1860s Moshoeshoe, fearing the dispersal and possible extinction of his people, appealed to the British for assistance. Sir Philip Wodehouse, governor and high commissioner of the Cape Colony, concerned for the stability of the region and

British interests in southern Africa, annexed the kingdom to the British crown. The British government endorsed his action, granting the new colony, Basutoland, to the Cape Colony in 1871.

Moshoeshoe died in 1870 and was buried on Thaba Bosiu. The "heroic age" of the Basotho had come to an end. The independent African mountain kingdom, forged against such odds in the earlier part of the 19th century, had lost much of its most productive land to the Boers and its political autonomy to the British. Nonetheless, the Basotho had retained some of their land and also their social and cultural independence, together with a fierce sense of injustice based on the memory of their resistance and what they had lost to their neighbours—a memory which they carried with them into the 20th century.

Basutoland (1871–1966). Attempts by the Cape Colony administration to co-opt the chieftainship and disarm the Basotho led to the Gun War of 1880–81. The Cape Colony relinquished Basutoland to British rule in 1884, when it became one of the British High Commission Territories in southern Africa.

Meanwhile, developments had been occurring in southern Africa that were to determine the course of Basutoland's future. The first mineral discoveries had been made that were to lay the foundation for the creation of the Union of South Africa (1910). In pursuit of racial supremacy, cheap labour, and the end to competition from independent African agricultural producers, South Africa deprived the African population of its social and political rights and most of its land. The small British-ruled enclave of Basutoland was profoundly affected by these policies. Basotho farmers took advantage of the markets for foodstuffs in the growing South African mining centres, and during the latter part of the 19th century they utilized new farming techniques to produce substantial surpluses of grain, which they sold on the South African markets. With the discovery of minerals, Basotho workers traveled to the mines to sell their labour for cash and for firearms.

Effects of the Union of South Africa

Increasing dependency on labour migrancy to South Africa has been the dominant feature of Lesotho's history in the 20th century, made necessary by taxation, increasing population behind a closed border, depletion of the soil, and the need for resources to supplement agricultural production and to acquire the means to purchase livestock for bridewealth. Basotho workers became an important element of the South African mining industry and Basutoland the classic example of the southern African labour reserve, its people dependent on work in South Africa for their survival.

By setting up a system of dual rule the British left considerable powers in the hands of the chiefs. They were headed by a paramount chief: Letsie (1870–91), Lerotholi (1891–1905), Letsie II (1905–13), Griffith (1913–39), and Seeiso (1939–40)—all of whom were descendants of Moshoeshoe—and subsequently the regent 'Mantsebo (1940–60). Under the paramount chiefs, authority was delegated through ranked regional chiefs drawn from the royal lineage and the most important chiefdoms. A system of customary law was adopted, with the land held in trust by the paramount chief for the people, and crucial aspects of local government were in the hands of the chiefs. The colonial government was headed by a resident commissioner and advised by the Basutoland National Council, which was led by the paramount chief and dominated by his nominated members.

The British administration was concerned primarily with balancing Basutoland's budget, and this was facilitated by ensuring that a substantial proportion of the population worked for wages in South Africa. The often domineering local chiefs could do little to halt the increasing social and economic deprivation within Basutoland. Education was left to the missionary societies, and there was little development of economic infrastructure or social services. The effects of Basutoland's external linkages with the developed world, and its internal underdevelopment, were seen clearly between 1929 and 1933, when the Great Depression coincided with a massive drought in Basutoland, driving so many people into South Africa that the population hardly increased for a decade.

Opposition to colonialism

Opposition to the colonial system grew. The missionary societies had created a vocal and informed class of teachers and writers. The Basutoland Progressive Association (founded in 1907) worked to reduce chiefly power and for representation on the Basutoland National Council; Lekhotla la Bafo (1919) was a more radical, populist organization. Neither organization, however, was able to effectively counter the power of the colonial adminstration and its traditionalist allies. An important factor that restricted all opposition movements and united all Basotho was their opposition to South Africa and their fear that the British might implement their intention to cede Basutoland to South Africa.

Widespread criticism of the system of administration led to attempts from the 1930s to reduce the number and prerogatives of the chiefs, but after World War II attempted reform was outstripped by the development of nationalist parties pressing for independence. Three major political parties emerged at this time: the Basutoland Congress Party (BCP) in 1952, under Ntsu Mokhehle; the more conservative Basutoland National Party (BNP) in 1958, under Chief Leabua Jonathan, which was associated with chiefly power and the Roman Catholic church; and the Marema-Tlou Freedom Party (1963), which was identified more with the defense of the powers of the country's principal chiefs, in particular the paramount chief, Bereng.

In the 1965 elections the BNP, with strong support from the Roman Catholic church and South African and white trading interests, succeeded in gaining a narrow majority over the BCP. On Oct. 4, 1966, Basutoland received its independence from Britain as the Kingdom of Lesotho, with Moshoeshoe II, named after the nation's founder, as the paramount chief.

The Kingdom of Lesotho. Lesotho faced tremendous problems. The country was poor and overpopulated, and the land was overworked. Agricultural production was low and had to be supplemented by massive labour migrancy to, and imports from, South Africa. Apart from land and labour, the only potential local resources for development were water and the diamonds in the mountains. The government was dependent on grants from Britain, the payments it received from South Africa as a member of the South African Customs Union, and the earnings brought into Lesotho from South Africa by migrant workers.

Chief Jonathan's regime

In January 1970 the first postindependence general elections were held, and the opposition BCP gained a majority of seats. But the results were never released, and Chief Jonathan suspended the constitution, arrested leading members of the opposition, and sent the king into temporary exile. Resistance to these moves was put down with considerable violence. After a short delay Britain recognized the legitimacy of the new regime.

The ruling party used legislation and violence—and the distribution of state patronage—to silence and control its opponents. In 1974 the BCP attempted to overthrow the regime, but this coup was put down, and Mokhehle of the BCP went into exile.

In an attempt to gain further acceptance and support within the international community, Chief Jonathan and his government began to adopt an increasingly hostile attitude toward its powerful neighbour, South Africa. The idea of supporting a small, embattled, sovereign African country in its struggle against its racist neighbour was attractive to a large number of donor countries, and during the 1970s Lesotho received an increasing amount of foreign aid. The overall assessment of these projects is that—while they attracted a significant amount of funding to Lesotho and increased the pace of modernization, urban development, economic infrastructure, education, communications, and the creation of a privileged bureaucracy—they failed to alleviate the long-standing problems of poverty and dependence. Thus, although mine wages and payments from the South African Customs Union increased in the 1970s, Lesotho was unable to use the increased revenues productively and remained dependent on South Africa.

The Lesotho government's hostility to the South African government and its acceptance of South African refugees also began to have serious consequences. As part of its

strategy of destabilizing its African neighbours, South Africa gave support to the armed wing of the BCP, the Lesotho Liberation Army, and in December 1982 the South African Defence Force attacked houses in Maseru that it alleged were African National Congress guerrilla bases, killing more than 40 people, many of whom were citizens of Lesotho. Relations grew increasingly tense as the South African government demanded the expulsion of South African refugees and began to interfere with the free flow of people and goods moving across the border.

Meaningful political activity remained confined to the upper social echelons, and differences began to appear among leading figures within the government; one faction advocated a policy more amenable to South African demands. Matters came to a head in January 1986 when the South African authorities placed severe restrictions on the movement of goods and people across the border, effectively closing it. Confronted with the consequences of this blockade, the pro-South African faction, led by Major General Justin Lekhanya, deposed Chief Jonathan (who died the next year) and took power in the name of the king and national reconciliation, establishing military rule with the king as head of state.

The Military Council

The Military Council banned open political activity and deported a number of South African refugees; South Africa lifted the blockade. In October 1986 Lesotho and South Africa signed the Lesotho Highlands Water Treaty, and in 1987 a South African trade mission was established in Lesotho.

Internally the Military Council did little to resolve political tensions, and it became associated with a number of brutal deaths and assassinations. Lesotho's economic impasse continued as recession and the general crisis deepened in South Africa and the gold mining industry reduced production. Conditions imposed by IMF loans also caused economic hardships. (J.J.Gu.)

In February 1990 conflict arose within the ruling class, and King Moshoeshoe went into exile. His eldest son, Mohato, was sworn in as Letsie III. In April 1991 Lekhanya was forced to resign, and his replacement lifted the ban on political activity. The political and economic crises continued, however, and in the general elections of March 1993, the BCP came to power under the leadership of Ntsu Mokhehle. Letsie's attempt to dismiss Mokhehle's government in August 1994 proved unsuccessful, and Moshoeshoe was reinstated as king in January 1995. Less than a year later, Moshoeshoe died, and Letsie reassumed the throne.

In 1997 the BCP dismissed Mokhehle as leader, and he eventually formed his own party, the Lesotho Congress of Democrats (LCD), which overwhelmingly won the general elections of May 1998. Upon Mokhehle's resignation, Pakalitha Mosisili became prime minister. The election was declared free and fair by many international observers, but the government faced an insurrection and asked the South African Development Community (SADC) to send troops to quell it. Eventually, the SADC forces restored order, and South Africa imposed an agreement that called for new elections by mid-2000. Elections were postponed until 2002. Meanwhile, the LCD government that took power in May 1998 under Mosisili signed an agreement with representatives from the SADC that put into effect an Interim Political Authority (IPA) with opposition representation. (Ed.)

For later developments in the history of Lesotho, see the BRITANNICA BOOK OF THE YEAR.

Malawi

A landlocked southeastern African country of spectacular highlands and extensive lakes, the Republic of Malawi occupies a narrow, curving strip of land along the East African Rift Valley. Stretching about 520 miles (840 kilometres) from north to south, it has a width varying from 5 to 100 miles and is bordered by Tanzania to the north, Mozambique to the east and south, and Zambia to the west. Its total area of 45,747 square miles (118,484 square kilometres) includes 9,347 square miles of lake surface dominated by the 8,900 square miles of Lake Nyasa (known in Malawi as Lake Malawi). Lilongwe is the seat of the legislature, and Blantyre is the seat of the judiciary and the executive.

Most of Malawi's population engages in cash-crop and subsistence agriculture. The country's exports consist of the produce of both small landholdings and large tea and tobacco estates. Malawi has successfully attracted foreign capital investment, has made great strides in the exploitation of its natural resources, and is one of the few African countries to regularly produce food surpluses.

PHYSICAL AND HUMAN GEOGRAPHY

The four basic regions

The land. *Relief.* While Malawi's landscape is highly varied, four basic regions can be identified: the East African (or Great) Rift Valley, the central plateaus, the highlands, and the isolated mountains. The East African Rift Valley—by far the dominant feature of the country—is a gigantic troughlike depression running through the country from north to south and containing Lake Malawi (north and central) and the Shire River valley (south). The lake's littoral, situated along the western and southern shores and ranging from 5 to 15 miles in width, covers about 8 percent of the total land area and is dotted with swamps and lagoons. The Shire valley stretches some 250 miles from the southern end of Lake Malawi at Mangochi to Nsanje at the Mozambique border and contains Lake Malombe at its northern end. The plateaus of central Malawi rise to an elevation of 2,500 to 4,500 feet (760 to 1,370 metres) and lie just west of the Lake Malawi littoral; the plateaus cover about three-fourths of the total land area. The highland areas are mainly isolated tracts that rise as much as 8,000 feet above sea level. They comprise the Nyika, Viphya, and Dowa highlands and Dedza-Kirk Mountain Range in the north and west and the Shire Highlands in the south. The isolated massifs of Mulanje (9,849 feet) and Zomba (6,841 feet) represent the fourth physical region. Surmounting the Shire Highlands, they descend rapidly in the east to the Lake Chilwa–Phalombe plain.

Drainage and soils. The major drainage system is that of Lake Malawi, which covers some 11,430 square miles and extends beyond the Malawi border. It is fed by the North and South Rukuru, Dwangwa, Lilongwe, and Bua rivers. The Shire River, the lake's only outlet, flows through adjacent Lake Malombe and receives several tributaries before joining the Zambezi River in Mozambique. A second drainage system is that of Lake Chilwa, the rivers of which flow from the Lake Chilwa–Phalombe plain and the adjacent highlands.

Soils, composed primarily of red earths, with brown soils and yellow gritty clays on the plateaus, are distributed in a complex pattern. Alluvial soils occur on the lakeshores and in the Shire valley, while other soil types include hydromorphic (excessively moist) soils, black clays, and sandy dunes on the lakeshore.

Climate. There are two main seasons—the dry season from May to October and the wet season from November to April. Temperatures vary seasonally as well, and they tend to decrease on average with increasing elevation. Nsanje (Port Herald), in the Shire River valley, has a mean July temperature of 69° F (21° C) and an October mean of 84° F (29° C), while Dedza, which lies at an altitude of more than 5,000 feet, has a July mean of 57° F (14° C) and an October mean of 69° F (21° C). On the Nyika Plateau and on the upper levels of the Mulanje Massif, frosts can occur in July. Annual rainfall is highest over parts of the northern highlands and on the Sapitwa peak of Mulanje Mountain, where it is about 90 inches (2,300 millimetres); it is lowest in the lower Shire valley, where it ranges from 25 to 35 inches (650 to 900 millimetres).

Diversity of vegetation

Plant and animal life. The natural vegetation pattern reflects the country's diversity in elevation, soils, and climate. Savanna (grassy parkland) occurs in the dry lowland areas. Open woodland with bark cloth trees, or *miombo* (leguminous trees unsuitable for timber), is widespread on the infertile plateaus and escarpments. Woodland, with species of acacia tree, covers isolated, more fertile plateau sites and river margins; grass-covered, broad depressions, called *madambo* (singular: *dambo*), dot the plateaus; grassland and evergreen forest are found in conjunction on the highlands and on the Mulanje and Zomba massifs.

Malaŵi's natural vegetation, however, has been altered significantly by human activities. Swamp vegetation has given way to agricultural species as swamps have been drained and cultivated. Much of the original woodland has been cleared, and, at the same time, forests of softwoods have been planted in the highland areas. High population density and intensive cultivation of the Shire Highlands have also hindered natural succession there, while wells have been sunk and rivers dammed to irrigate the dry grasslands for agriculture.

Game animals abound only in the game reserves, where antelope, buffalo, elephants, leopards, lions, rhinoceroses, and zebras occur; hippopotamuses live in Lake Malaŵi. The lakes and rivers contain more than 200 species and 13 families of fish. The most common and commercially significant fish include the endemic tilapia, or *chambo* (nest-building freshwater fish); catfish, or *mlamba;* and minnows, or *matemba.*

Settlement patterns. Malaŵi is the most densely populated country in southern Africa, but ironically it is also one of the least urbanized, with 9 out of 10 people living in rural locations. A rural village—called a *mudzi*—is usually small. Organized around the extended family, it is limited by the amount of water and arable land available in the vicinity. On the plateaus, which support the bulk of the population, the most common village sites are at the margins of *madambo,* which are usually contiguous with streams or rivers and are characterized by woodland, grassland, and fertile alluvial soils. In highland areas, scattered villages are located near perennial mountain streams and pockets of arable land. The larger settlements of the Lake Malaŵi littoral originated in the 19th century as collection points for slaves and later developed as lakeside ports. Improvements in communication and the sinking of wells in semiarid areas have permitted the establishment of new settlements in previously uninhabited areas. Architecture is also changing; the traditional round, mud-walled, grass-roofed hut is giving way to rectangular brick buildings with corrugated iron roofs.

Urban development began in the colonial era with the arrival of missionaries, traders, and administrators and was further stimulated by the construction of the railway. The only true urban centres are Blantyre-Limbe, Zomba, Mzuzu, and Lilongwe. Although some district centres and missionary stations have an urban appearance, they are closely associated with the rural settlements surrounding them. Blantyre, Malaŵi's industrial and commercial centre, is situated in a depression on the Shire Highlands at an altitude of about 3,400 feet. Zomba, seat of the University of Malaŵi, lies at the foot of Zomba Mountain and is purely of administrative origin. Farther north is Lilongwe, Malaŵi's new capital, which is developing agricultural industries.

The people. Nine major ethnic groups are historically associated with modern Malaŵi—the Chewa, Nyanja, Lomwe, Yao, Tumbuka, Sena, Tonga, Ngoni, and Ngonde (Nkonde). All the African languages spoken belong to the Bantu language family. Chichewa is the national language and English the official language, although English was understood by less than one-fifth of the population at independence. Chichewa is spoken by about two-thirds of the population. Other important languages are Chilomwe, Chiyao, and Chitumbuka.

Predominant languages

Some two-thirds of the population are Christian, of which more than half are members of various Protestant denominations and the remainder Roman Catholic. Muslims constitute almost one-fifth of the population, and traditional beliefs are adhered to by nearly everyone else.

The population is growing at a rate well above average for sub-Saharan Africa. The birth rate is one of the highest on the continent, but the death rate is also high, and life expectancy—at 47 years—is significantly below average for a southern African country. With nearly one-half the population younger than age 15, high birth and population-growth rates should continue in the 21st century. By the early 1990s the problem of high population growth was compounded further by the then decade-long influx of refugees from Mozambique—estimated to number about one million—fleeing the civil war in that country.

The economy. The backbone of the Malaŵi economy is agriculture, which regularly accounts for one-third of the gross domestic product and 90 percent of export earnings and which employs more than 80 percent of the working population. Since the mid-1960s, however, the sector has become increasingly concentrated on three cash crops—tobacco, tea, and sugar—and increasingly dependent on the market demand for these commodities. The small industrial sector is geared largely to processing agricultural products, with some limited manufacturing of import substitutes.

The government has sought to strengthen the agricultural sector by encouraging integrated land use, higher crop yields, and irrigation schemes. In pursuit of these goals, several large-scale integrated rural development programs, covering one-fifth of the country's land area, have been put into operation. These projects include extension services; credit and marketing facilities; physical infrastructures such as roads, buildings, and water supplies; health centres; afforestation units; and crop storage and protection facilities. Outside the main program areas, advisory services and educational programs are available, and the Malaŵi Young Pioneers, a national youth movement, trains more than 2,000 young men and women yearly in techniques of rural development.

Promoting higher crop yields

Both higher incomes in the rural areas and continued public expenditure are factors that government planners hope will increase the purchasing power of the public as a whole and thus provide a stimulus for further industrial development. The government continues to promote the establishment of import-substitute industries, in hopes of reducing reliance on expensive imported goods, strengthening the balance-of-payments situation, and, at the same time, increasing employment opportunities.

Resources. Most of Malaŵi's mineral deposits are neither extensive enough for commercial exploitation nor easily accessible. Some small-scale mining of coal takes place at Livingstonia and Rumphi in the north, and quarrying of limestone for cement production is also important. Exploration and assessment studies continue on other minerals such as apatite, located south of Lake Chilwa; bauxite, on the Mulanje Massif; kyanite, on the Dedza-Kirk Range; vermiculite, south of Lake Malaŵi near Ntcheu; and rare-earth minerals, at Mount Kangankunde northwest of Zomba. Deposits of asbestos, uranium, and graphite are known to exist as well.

More than half of Malaŵi's total land area is potentially arable, though only about one-fourth of it is cultivated regularly. Forests and woodlands cover nearly half of the country, and almost 4,000 square miles are in state-controlled forest reserves.

The lakes and rivers of Malaŵi are estimated to provide more than 60 percent of the country's animal protein intake. Lake Malaŵi, in particular, is a rich source of fish within easy access for most of the country's population.

Malaŵi's water resources are plentiful, although some rural areas are inadequately supplied. Treated water for the major cities of Blantyre and Lilongwe is supplied by the Walker's Ferry Scheme and the Kamuzu Dam, respectively. Most of the rivers are seasonal, but a few large ones, particularly the Shire River along its middle course, have a considerable irrigation and electricity-generating potential. The total hydroelectric potential of the country is estimated to be about 1,200 megawatts, of which more than 500 megawatts can be generated on the Shire River alone. Present power demands, which represent only about 10 percent of potential capacity, are met by the Nkula Falls (two plants) and Tedzani Falls hydroelectric schemes and by diesel plants.

Agriculture, fishing, and forestry. The most important agricultural export products are tobacco, tea, sugar, and peanuts (groundnuts). Tea is grown on plantations on the Shire Highlands by the largest proportion of the country's salaried labour force. Tobacco, by far the most important export, is raised largely on the central plateau on large estates. Corn (maize) is the principal food crop and is typically grown with beans, peas, and peanuts throughout the country by virtually all smallholders. Other important crops are cotton, cassava, coffee, and rice. Although the

Andrew C. Millington

major share of commercial crop production and nearly one-fifth of all cultivated acreage is on large estates, most farms are small, averaging less than 3 acres (1.2 hectares). Smallholder cash crops are purchased and marketed by the Agricultural Development and Marketing Corporation; a few cooperative societies purchase and market produce.

Lake Malaŵi is the major source of Malaŵi's fishing industry, but Lakes Chilwa and Malombe and the Shire River also contribute significantly to the annual catch. The industry supplies mainly a local market, but some fish are exported to neighbouring countries.

Since the early 1970s the government has sponsored the development of several large timber and pulpwood plantations aimed at making the country self-sufficient in construction grades of timber. Pine and eucalyptus have also been planted extensively in the northern Viphya Mountains to supply a large pulp and paper project in the region. Sawn poles, posts, and manufactured wooden items are produced largely for the domestic market, although some forest products are exported.

Industry. Development of the country's industrial base was accorded high priority at independence, and Malaŵi now satisfies much of its domestic need for products such as cotton textiles, canned foodstuffs, beer, edible oils, soaps, sugar, radios, hoes, and shoes, all of which previously had to be imported. The main demand for electric power is in the industrial areas of the south near Blantyre, where electricity consumption has steadily multiplied; the industrial area of Lilongwe; the vast sugar estates of Sucoma and Dwangwa; and the pulpwood scheme of Viphya.

Bauxite production

Exploitation of bauxite, Malaŵi's most economically important mineral reserve, will depend on an increased hydroelectric capacity to meet the demand of bauxite smelting for abundant cheap electric power. Only such an energy supply could offset the heavy costs of transporting the ore from its remote location to be processed into alumina and then of transporting the alumina to the coast for export.

Trade and finance. About two-thirds of Malaŵi's foreign-exchange earnings are derived from exports of tobacco, of which Malaŵi is the second largest producer in Africa (after Zimbabwe). The main purchaser of its tobacco—as well as of its second major export, tea—is the United Kingdom. Sugar and cotton are the country's other major exports. Diesel fuel and petroleum, fertilizers, consumer goods, machinery and transport equipment, and medical supplies are the main imports. South Africa, Japan, the United States, Germany, and The Netherlands are Malaŵi's other major trading partners.

There are two commercial banks—the National Bank of Malaŵi and the Commercial Bank of Malaŵi. The Reserve Bank of Malaŵi is the central bank of the country. Other financial institutions include the Post Office Savings Bank, the New Building Society, and finance houses. Among the several insurance companies, only one is locally based.

Soon after independence, the government developed an economic policy that was stringently anti-inflationary, arising from the need to reduce the deficit in public expenditure and to maintain the level of foreign-exchange reserves. In budgetary policies maximum restraint, consistent with development needs and planned reduction of grants-in-aid from the United Kingdom, was exercised.

The main emphasis continues to be directed toward agricultural export production and the completion of investment projects, while at the same time maintaining a favourable balance of trade. Malaŵi's development strategy emphasizes concern for the public sector only insofar as it does not interfere with the private sector. Developmental priority is given to transport, agriculture, education, and housing.

Tax structure

A small annual tax is payable by all men over 18 years of age unless they are liable to other taxes. Employees pay an income tax. Local companies pay taxes at a fixed rate of chargeable income, and companies incorporated outside Malaŵi pay a small additional tax.

There is no sizable industrial labour force. Some 20 trade unions and employer associations are connected with such enterprises as the tea plantations, the building and construction industry, road transport, and railways. The Ministry of Labour plays a significant role in maintaining good relations between employers and employees.

Transportation. Malaŵi has road connections to Chipata on the Zambian border; to Harare, Zimbabwe, via Mwanza and Tete; and to several points on the Mozambique border. The backbone of the road system is represented by a road running from Blantyre in the south to Lilongwe in the west. A lakeshore highway runs roughly parallel to the inland highway from Mangochi to Karonga.

Of Malaŵi's two railway links to the sea, the first stretches more than 570 miles from Lilongwe eastward to the port of Beira on the Mozambique coast; an extension from Lilongwe to Mchinji, on the Zambia border, was completed in 1980. The second railroad joins the Salima-Blantyre line at Nkaya Junction to the south of Balaka and travels due east to link with the Mozambique Railways system at Cuamba, whence it continues to the port of Nacala. Increased guerrilla activity in Mozambique after 1981, including attacks on these rail lines, forced Malaŵi to seek

alternative, much longer routes to the sea, first through South Africa and then through Tanzania, adding substantially to its freight transport costs. By the early 1990s, traffic had again resumed slowly through Mozambique as Malawian and Mozambican troops were more able to suppress rebel attacks.

Of the rivers, only the Shire is partially navigable, all other streams being broken by rapids and cataracts. Lake Malawi has long been used as a means of inexpensive transportation. A passenger and cargo service that operates on the lake is linked to the Chipoka railway junction about 17 miles south of Salima. The main ports on the lake are Monkey Bay, Nkhotakota, Nkhata Bay, and Likoma Island.

Air Malawi, the national airline, operates services from the main airport at Chileka, 11 miles from Blantyre, to several foreign countries and neighbouring African capitals.

Administration and social conditions. *Government.* Under the republican constitution of Malawi promulgated in July 1966, the government is composed of a president, who is head of state and government, and the National Assembly. The cabinet is appointed by the president. The original number of 50 elected members of the assembly was raised to 60 in 1969, 87 in 1979, 112 in 1987, and 141 in 1992. In addition, the president can appoint no more than 10 nominated members.

The country is divided into 24 administrative districts. The local government system consists of district councils, the city councils of Blantyre and Lilongwe, the municipality of Zomba, and seven town councils.

Malawi was a de facto one-party state from August 1961, when the first general elections were held, until 1966, when the constitution formally recognized the Malawi Congress Party—led by President H. Kamuzu Banda—as the sole political organization. According to the constitution, elections for the presidency and the assembly are to be held every five years; general elections, however, have been held only in 1971, 1978, and 1992. The presidential candidate is nominated by an electoral college composed of party officials at the national, regional, and district levels; the League of Malawi Women; the League of Malawi Youth; members of Parliament; recognized chiefs; and all chairmen of district councils. In 1971 Banda was elected president for life. Candidates for the National Assembly may stand for election only after their nomination by the district party conferences.

Elections

Justice. The judiciary is based upon the system prevailing in the British colonial era and Malawi traditional law. It consists of a Supreme Court of Appeal, a High Court, magistrates' courts, and traditional courts. Since 1969, criminal cases involving witchcraft or local superstition, for which the death penalty can be imposed, have been tried in the traditional courts instead of the High Court. The minister of justice has the power to direct a particular case or group of cases to a particular court; cases tried in the traditional courts can be appealed to the National Traditional Court of Appeal.

Health and welfare. Health facilities include two central hospitals, district hospitals, rural clinics, Zomba Mental Hospital, and Kochira Leprosarium. Common diseases include malaria, schistosomiasis, and trachoma. Malawi is also affected by a relatively high incidence of AIDS (acquired immune deficiency syndrome), particularly in the urban areas, which threatens to tax the country's overburdened health-care system even more. Malawi has the highest infant mortality rate in southern African and one of the highest population-to-physician ratios in all of sub-Saharan Africa.

An acute shortage of housing has existed for several years in urban areas. The Malawi Housing Corporation has launched several projects to build houses and develop traditional housing areas.

Education. Elementary education is not compulsory, and only about one-half of all eligible children attend primary school. Despite this low proportion, Malawi's primary schools feature one of the highest student-teacher ratios in Africa. Postprimary education comprises a four-year secondary-school course that can lead to a university education. The Malawi Correspondence College is available to students unable to attend regular secondary school. There are also institutions for teacher training and for technical and vocational training. The Kamuzu Academy at Mtunthama is a secondary school for gifted children. The University of Malawi, founded in 1964, has four constituent colleges.

Cultural life. Though under the impact of modernization, Malawi's traditional culture is characterized by continuity as well as change, and the traditional life of the village has remained largely intact. One of the most distinctive features of Malawi culture is the enormous variety of traditional songs and dances that use the drum as the major musical instrument. Among the most notable of these dances are *ingoma* and *gule wa mkulu* for men and *chimtali* and *visekese* for women. There are various traditional arts and crafts, including sculpture in wood and ivory. There are two museums—the Museum of Malawi in Blantyre and a smaller one in Mangochi. While various cultural activities are organized by the Ministry of Youth and Culture, the University of Malawi Travelling Theatre, and other groups in Blantyre, the radio from Zomba and Lilongwe has proved to be the most effective means of bringing traditional and modern plays to the rural population. (Z.D.K./Ed.)

Traditional dances

For statistical data on the land and people of Malawi, see the *Britannica World Data* section in the BRITANNICA BOOK OF THE YEAR.

HISTORY

The paleontological record of human cultural artifacts in Malawi dates back more than 50,000 years, although known fossil remains of early *Homo sapiens* belong to the period between 8000 and 2000 BC. These prehistoric forebears have affinities to the San (Bushmen) of southern Africa and were probably ancestral to the Twa and Fula, whom Bantu-speaking peoples claimed to have found when they invaded the Malawi region between the 1st and 4th centuries AD. From then to about AD 1200, Bantu settlement patterns spread, as did ironworking and the slash-and-burn method of cultivation. The identity of these early Bantu-speaking inhabitants is uncertain. According to oral tradition, names such as Kalimanjira, Katanga, and Zimba are associated with them.

With the arrival of another wave of Bantu-speaking peoples between the 13th and 15th centuries AD, the recorded history of the Malawi region began. These peoples migrated into the region from the north, and they interacted with and assimilated the earlier pre-Bantu and Bantu inhabitants. The descendants of these peoples maintained a rich oral history, and, from 1500, written records were kept in Portuguese and English.

Among the notable accomplishments of the last group of Bantu immigrants was the creation of political states or the introduction of centralized systems of government. They established the Maravi Confederacy about 1480. During the 16th century, the confederacy encompassed the greater part of what is now central and southern Malawi, and, at the height of its influence in the 17th century, its system of government affected peoples in the adjacent areas of modern Zambia and Mozambique. North of the Maravi territory, the Ngonde founded a kingdom about 1600. In the 18th century, a group of immigrants from the eastern side of Lake Malawi created the Chikulamayembe state to the south of the Ngonde.

Early political units

The precolonial period witnessed other important developments. In the 18th and 19th centuries, better and more productive agricultural practices were adopted. In some parts of the Malawi region, shifting cultivation of indigenous varieties of millet and sorghum began to give way to more intensive cultivation of crops with a higher carbohydrate content, such as corn, cassava, and rice.

The independent growth of indigenous governments and improved economic systems was severely disturbed by the development of the slave trade in the late 18th century and by the arrival of foreign intruders in the late 19th century. The slave trade in Malawi increased dramatically between 1790 and 1860 because of the growing demand for slaves on Africa's east coast. Swahili-speaking people from the east coast and the Ngoni and Yao peoples

entered the Malawi region between 1830 and 1860 as traders or as armed refugees fleeing the Zulu states to the south. All of them eventually created spheres of influence within which they became the dominant ruling class. The Swahili speakers and the Yao also played a major role in the slave trade.

Islām and Christianity

Islām spread into Malawi from the east coast. It was first introduced at Nkhotakota by the ruling Swahili-speaking slave traders, the Jumbe, in the 1860s. Traders returning from the coast in the 1870s and '80s brought Islām to the Yao of the Shire Highlands. Christianity was introduced in the 1860s by David Livingstone and by other Scottish missionaries who came to Malawi after his death in 1873. Missionaries of the Dutch Reformed church of South Africa and the White Fathers of the Roman Catholic church arrived between 1880 and 1910.

Christianity owed its success to the protection given to the missionaries by the colonial government, which the British established after occupying the Malawi region in the 1880s and '90s. British colonial authority was welcomed by the missionaries and some African societies but was strongly resisted by the Yao, Chewa, and others. In 1891 the British established the Nyasaland Districts Protectorate, which was called the British Central Africa Protectorate from 1893 and Nyasaland from 1907.

Under the colonial regime, roads and railways were built, the cultivation of cash crops by European settlers was introduced, and inhumane practices were suppressed. On the other hand, the colonial administration did little to enhance the welfare of the African majority because of its commitment to the interests of the European settlers. It failed to develop African agriculture, and many able-bodied men migrated to neighbouring countries to seek employment. Furthermore, between 1951 and 1953 the colonial government decided to join the colonies of Southern and Northern Rhodesia and Nyasaland in the Federation of Rhodesia and Nyasaland, against bitter opposition from their African inhabitants.

These negative features of colonial rule prompted the rise of a nationalist movement. From its humble beginnings during the period between the world wars, African nationalism gathered momentum in the early 1950s. Of special impetus was the imposition of the federation, which nationalists feared as an extension of colonial power. The full force of nationalism as an instrument of change became evident after 1958 under the leadership of Hastings Kamuzu Banda. The federation was dissolved in 1963, and Malawi became independent as a member of the Commonwealth of Nations on July 6, 1964.

(Z.D.K./K.M.G.P./Ed.)

Soon after independence, a serious dispute arose between Banda, the prime minister, and other ministers. In September 1964 three ministers were dismissed and three others resigned in sympathy. Henry Chipembere, one of these ministers, escaped from house arrest and defied attempts to recapture him, becoming the focus for antigovernment opinion until his death in 1975. On July 6, 1966, Malawi became a republic, and Banda was elected president.

Banda's presidency

Malawi's 1966 constitution established a one-party state under the Malawi Congress Party (MCP), which in turn was controlled by Banda, who consistently suppressed any opposition. The conservative MCP concentrated its attention on economic development. In foreign policy Banda adopted a position that was in opposition to most countries in sub-Saharan Africa: he established friendly trading relations with the Republic of South Africa and appealed to other African leaders to be more realistic in their attitude toward racial problems. Securing access to transportation routes to coastal ports was a major factor in Malawi's regional policy.

Although Banda was made president for life in 1971, political agitation forced him to accept multiparty elections for the National Assembly and the presidency. In 1994 presidential elections were won by Bakili Muluzi, who led the United Democratic Front (UDF). Muluzi released or lowered the sentences of various political prisoners and focused on food production, alleviating poverty, and ending governmental corruption. Banda and others were arrested for the murders of several government officials in 1983, but they were acquitted in 1995. Before his death in 1997, Banda apologized to Malawians for any acts of brutality his regime had committed. Muluzi was reelected in 1999, and the UDF continued to dominate the government. Despite his intentions, Muluzi was not entirely successful in eliminating corruption and poverty, and food production continued to fall short of demand. The country also faced a difficult challenge as the number of AIDS cases continued to grow at the beginning of the 21st century. (Ed.)

For later developments in the history of Malawi, see the BRITANNICA BOOK OF THE YEAR.

Mozambique

The Republic of Mozambique (República de Moçambique), formerly the People's Republic of Mozambique, stretches along the Indian Ocean coast of southeastern Africa from Cape Delgado at latitude 10°27′ S to latitude 26°52′ S. Its westernmost border at the Aruângua (Luangwa) River reaches longitude 30°31′ E, and the easternmost point, 110 miles (175 kilometres) east of Nampula on the Indian Ocean coast, is at longitude 40°51′ E, but most of the country's 313,661 square miles (812,379 square kilometres) lies between longitudes 32° and 40° E. It is bordered to the south and southwest by the Republic of South Africa and Swaziland, to the west by Zimbabwe, to the northwest by Zambia, Lake Nyasa (Niassa), and Malawi, and to the north by Tanzania. The Mozambique Channel separates it from Madagascar to the east. The capital city of Maputo (formerly Lourenço Marques) is in the nation's southernmost province.

Mozambique's extensive coastline (1,563 miles) features some of Africa's best natural harbours, a fact that contributes to the nation's important transportation and communication role in the region. The massive Zambezi River dominates the central area and provides sufficient hydroelectric potential to make Mozambique the region's powerhouse.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Lowlands dominate the southern provinces, narrowing to a mere coastal plain north of the cleft that the Zambezi River cuts through the country's midsection. The Zambezi valley, the lower section of which is a part of the Eastern (Great) Rift Valley, is the country's most dramatic geographic feature. Throughout the country the land rises gently to the west. In the centre and north it slopes steadily into the high plains, and ultimately the mountainous regions of the northwest border Malawi and Zambia. Four of Mozambique's five highland regions straddle the border areas in the west and northwest: the Chimoio Plateau on the border with Zimbabwe, the Maravia highlands bordering Zambia, and the Angónia highlands and Lichinga Plateau, which lie, respectively, west and east of Malawi's protrusion into Mozambique. Mount Binga, the country's highest elevation at 7,992 feet (2,436 metres), is part of the Chimoio highlands. The 7,936-foot (2,419-metre) peak at Mount Namúli dominates the Mozambican highland, which constitutes much of the northern interior.

Highland regions

Drainage. Mozambique's many rivers hold the promise of irrigation for agriculture and hydroelectric power for the entire region. The Rovuma River defines most of Mozambique's northern border with Tanzania. The Zambezi River and its tributaries dominate the central region, and the Maputo River forms part of the southernmost boundary with Swaziland and South Africa. Rivers—including the Lúrio, Ligonha, Save, Changane, and Komati (Incomati)—also define many of the country's local political boundaries. Other important drainage systems include the Messalo River in the north and the Púngoè, Revuè, and Búzi rivers, which enter the Mozambique Channel together just south of the port of Beira.

The massive Zambezi waterway clearly dominates the nation's drainage and its hydroelectric strategies. It flows 509 miles through the country and drains more than 87,000 square miles of the central region. The Rovuma, Lúrio, Save, and Messalo systems follow in size. Mozambique shares the borders of Lakes Nyasa, Chiuta, and

Chilwa with Malawi, but aside from these border lakes and the lakes created by the country's hydroelectric dam systems—particularly the extensive system created by the Cabora Bassa Dam at Songo on the Zambezi—the country has no important lakes.

Soils. Africa's ancient basement complex of granite underlies most of northern and west-central Mozambique, whereas the soils of the southern and east-central regions are sedimentary. Mozambique's soils are diverse in quality and type, but the central and northern provinces enjoy generally more fertile, water-retentive soils than does the south, where sandy, infertile soils prevail. South of Beira fertility is largely limited to alluvial soils in the valleys of the Save, Limpopo, Komati, Umbelúzi, and Maputo rivers. Several pockets of fertile but heavy soil occur southwest of Inhambane. The central region enjoys its broadest expanse of rich alluvial soils along the Zambezi delta. The northern soils have higher red clay content and range from infertile to quite fertile. Their water-retentive qualities allow agricultural potential to extend beyond the river valleys.

Monsoon influence

Climate. Mozambique lies largely within the tropics, and much of the coastline is subject to the regular seasonal influence of the Indian Ocean monsoon rains. The monsoon influence is strongest in the northeast but is modified somewhat in the south by the island barriers of Madagascar, the Comoros, and the Seychelles. With the exception of highland areas on the northern and western borders and around Gurue (east of the Malawi protrusion into Mozambique), all locations where altitude modifies both temperature and humidity, the climate is seasonal and tropical. Daily temperatures throughout the country average in the mid- to upper 70s F (lower to mid-20s C), with the highest temperatures occurring between October and February and the lowest in June and July. Uncomfortably warm average daily temperatures, in the upper 80s F (low 30s C), are normal only in the upper Zambezi valley and along the northeastern coast, while cool temperatures, in the 60s F (10s C), occur year-round only in the mountainous areas on the western borders.

Humidity and rainfall vary a great deal throughout the country. Again, the sharpest difference is between north and south. The entire region north of the Zambezi and east of the Shire River valley is humid and warm, as is the coastal plain in the south. The southern interior and most of the Zambezi valley west of the Shire is quite dry, and the south-central area around Pafuri is even considered semiarid, receiving only about 2.5 inches (60 millimetres) of rainfall per month in the wet season from November to February and almost none in the dry season between April and October. In the south, to the west of the coastal plain, average annual rainfall is only about 24 inches. Rainfall in the central region east of the Shire River and throughout the north is much higher, between 40 and 70 inches, with the highest rainfall averaging more than 70 inches in the highlands and in coastal pockets around Beira and Quelimane. In the Zambezi valley west of the Shire, however, average rainfall dips to the 24- to 32-inch levels typical of the south. As the annual rainfall figures suggest, southern and west-central Mozambique are subject to drought crises. The drought of 1992 was the worst since records have been kept.

Plant and animal life. Although Mozambique retains some dense forestlands in the north-central interior and on the Chimoio Plateau, most of the north and east-central areas are open forest. In the south the open forest of the east becomes brush and savanna grassland to the west. The largest forest reserves are on the Chimoio Plateau west and southwest of Beira and in the northern interior south of the Lúrio River. Mozambique maintains four national parks in the central and southern areas—Gorongosa, Zinave, Bazaruto, and Banhine.

Wildlife populations include water buffalo, elephant, warthog, leopard, baboon, giraffe, zebra, antelope, lion, and numerous species of ungulate and cat. Crocodiles and hippopotamuses are still found in slow-moving waterways. Snakes—including impressive pythons and dangerous puff adders, cobras, and vipers—are found throughout the territory. Flamingos, cranes, storks, herons, pelicans, ibis, and other tropical water birds exist throughout Mozambique but are more numerous in the moister areas of the northeast. Scavengers include crows, vultures, and buzzards, and game birds include guinea fowl, partridge, quail, and a range of geese and ducks. Game reservations and national hunting areas are located largely in the central and southern areas, with the exception of the important Niassa reserve on the Tanzanian border and the Gilé reserve southwest of Nampula. The largest game areas are just south of the Zambezi bordering the Chimoio highlands. The nation's five hunting reservations are Niassa, Gilé, Marromeu, Pomene, and Maputo.

Birdlife

Settlement patterns. Since Mozambique is an overwhelmingly agricultural country, with more than 80 percent of the labour force involved in farming, settlement patterns reflect the country's agricultural potential. Areas with the best soils and climates are the most populous. The Lúrio and Ligonha river valleys in the northeast, as well as the coastal plain between them, are densely populated, as are the lower reaches of the Limpopo valley and the limited areas of deep rich soil south and west of Inhambane. In most rural areas settlements reflect family arrangements and are dispersed. In drier areas settlement patterns are shaped by efforts to combine agriculture with pastoralism. Settlements are separated by expanses of grazing area. People in small settlements typically plant several crops in diverse and specific environments to minimize the danger of famine in the case of flood, drought, pests, or other natural stress.

The Portuguese colonial state developed rural settlement schemes during the late colonial era, and shortly after independence in 1975 the national government strongly promoted communal village and state farm projects, all of which fostered denser rural settlement, particularly in the south. In most cases, however, such schemes proved largely unsatisfactory, and more dispersed settlement patterns tended to reemerge when government policy and military security permitted. Although dispersed settlement makes it more difficult for the state to provide security and community services, it is preferred by farmers.

Major cities

Maputo is the country's principal urban settlement, followed by Beira, Nampula, Nacala, Quelimane, Pemba, and Chimoio. Most of these urban settlements are port, transportation, and communications centres, which grew in response to the service needs of Mozambique's western neighbours. The development of Nampula, Nacala, and Chimoio dates from the Portuguese colonial state's efforts to decentralize economic and administrative infrastructure as part of its counterinsurgency strategy of the late 1960s and '70s. Prior to that period investment in Mozambique was strongly focused on Maputo. Only Maputo and Beira have substantial foreign communities.

The people. *Ethnic and linguistic composition.* Although Portuguese is the official language, the vast majority of Mozambicans speak languages of the Niger-Congo group, the so-called Bantu languages, which dominate central and southern Africa. Within that group, Makua-Lomwe, Tsonga, and Shona are the most widespread languages, but the country has great linguistic and cultural variety. Language groups in the Zambezi valley are quite diverse and include Sena, Lomwe, and Chuabo. Mozambicans share many languages with their neighbours, including Swahili, Yao, and Makonde with Tanzanians; Nyanja and Chewa with Malawians; Shona with Zimbabweans; and Shangaan with people of the northeastern Transvaal in South Africa. The Swahili speakers of Mozambique's northern coast have an Islāmic heritage in common with the coastal populations of eastern Africa as far north as Mogadishu, Somalia. Similarly, small groups in the far south and throughout the country share Nguni languages with South African and Zimbabwean peoples as a result of the important population movements of the early 19th century. Groups speaking European and Asian languages are largely limited to the port cities of Maputo, Beira, Quelimane, Nacala, and Pemba.

In terms of cultural organization, the Zambezi valley again provides Mozambique's key marker, roughly dividing groups that trace their heritage according to principles of matrilineality to the north and groups that order them-

selves along patrilineal lines to the south. In matrilineal groups authority rests in the senior male of the extended family traced through the female line, whereas in patrilineal groups the senior male is identified through the male line. Throughout the 20th century, however, there was a tendency for once-matrilineal groups to adopt patrilineality and virilocal settlement—with new families settling in a household of the husband's lineage rather than the wife's.

Of the more than 30 languages spoken in Mozambique, Bantu languages—a subgroup of the Benue-Congo branch of the Niger-Congo language family—compose the vast majority. One of these, Makua, is spoken by almost one-third of the population. Tsonga (Shangaan, Changana), which is spoken south of the Sabi River, has more than two million speakers, and Lomwe, Sena, and Chuabo more than one million speakers each. Both Lomwe and Chuabo are closely related to Makua. Lomwe is spoken in the northeast and central regions, and Sena mainly in the northwest. Chuabo is the language of the central coast, and Swahili is the language typically of the coastal strip north of the Lúrio River. Chopi, Makonde, Marendje, Nsenga, Shona, Tswa, Yao, Chewa (Cewa), and Nyanja languages are also spoken.

Although Portuguese is the main language of only a small fraction of the people, it is spoken as a lingua franca by some two-fifths of the country's inhabitants. Portuguese speakers are strongly concentrated in Quelimane and the capital of Maputo.

Religions. Prior to independence in 1975, almost one-third of the population was nominally Christian, and a small number were Muslim. Christian missions were active throughout the country during the colonial era, and after 1926 the Roman Catholic church was given government subsidies and a privileged position with respect to its educational and evangelical activities among the African population. Although the Portuguese were generally suspicious of Protestants, Protestant missions—including Presbyterian, Free Methodist, African Methodist Episcopal, Methodist Episcopal, Anglican, and Congregationalist missions—remained active. A variety of African independent churches developed, but because of official disdain for their activities they were unlikely to register publicly.

Mission activities

After independence the government, led by the Mozambique Liberation Front (Frente de Libertação de Moçambique; Frelimo), presented conflicting messages regarding religion. Although it confirmed a policy of open and free religious affiliation, Frelimo actively persecuted the country's more than 20,000 Jehovah's Witnesses, and its overall political and ideological emphasis discouraged religious expression and organization. By the end of the 1980s, however, Frelimo had changed its approach, and religious organizations began to reemerge as an important popular force.

Almost half of the people now follow traditional religions, while fewer than one-fourth adhere to some form of Christianity, and almost three-tenths are Muslims. Although Islāmic communities are found in most of Mozambique's cities, Muslims constitute the majority in only the northern coastal region between the Lúrio and Rovuma rivers.

Demographic trends. Mozambique's rate of population growth, though high by world standards, is average for southern Africa. The country's demographic profile reflects the poverty, health, and political situation of the majority population of southern Africa. Malnutrition, insufficient access to clean water supplies, insufficient sanitation facilities, and intractable, incurable, and endemic diseases all take an enormous toll. Mozambique's rate of infant mortality is among the highest in the world. Children have less than a one-in-four chance of surviving to age 5, and average life expectancy is under 50 years. As in most African nations, Mozambique's population is young—more than 40 percent is under the age of 15 and 70 percent is under 30.

Population movement across Mozambique's borders has been facilitated in many instances by shared language and culture. During the colonial era Mozambicans worked in neighbouring countries as contract labourers and independent migrant workers, particularly in the mining areas of South Africa and in the farms and cities of Southern Rhodesia (now Zimbabwe). After the coup d'état in Portugal (April 24, 1974) that signaled the end of Portuguese colonial rule in Africa, the Portuguese population in Mozambique plummeted from a high of about 250,000 to fewer than 10,000. Within five years of independence, social and economic destabilization by the antigovernment forces of the Mozambique National Resistance (Resistência Nacional Moçambicana; Renamo) brought about extensive population dislocation in the Mozambican countryside. Disruption of rural production and distribution, natural disaster, and counterproductive government agricultural and commercial policies fueled a generalized economic collapse. By the mid-1980s almost one-third of the nation's population had left their fields and herds and fled to refugee settlements around the major cities and in neighbouring countries.

Population movement

The economy. Mozambique's predominantly rain-fed agricultural economy is based on family production and hoe technology. During the 20th century, plantation production of market crops displaced family agriculture in some of the most fertile areas. The colonial economy was characterized by private monopolies, central planning, and state marketing of key products, all designed to promote capital accumulation by the state, Portuguese settlers, and Portuguese-based commerce and industry. Colonial policy had also excluded most Mozambicans from highly skilled and managerial positions until the years immediately preceding independence. The Frelimo government tried to redirect patterns of accumulation and development by nationalizing key properties, promoting African education and training, and breaking up the Portuguese and Asian hold on commercial distribution. Despite Frelimo's public stand against ethnic discrimination, Portuguese settlers and Asian traders—threatened by the government's economic policies—left by the thousands. Settlers anticipating nationalization abandoned their properties, adding by default to the proportion of the national economy that the state controlled. Large-scale state-run farms and communal and cooperative farming replaced the settler and company plantations. Frelimo's agricultural undertakings proved unproductive and unmanageable, and, in combination with the flight of Asian merchants, much of the nation's agricultural production, commercial, and distribution sectors collapsed. The state ultimately reoriented economic policy in accordance with structural adjustment plans imposed by the International Monetary Fund (IMF), which emphasized decentralization and assisted family farming in an attempt to salvage and rebuild the economy.

Although agriculture is the most common economic activity, migrant labour remittances from South Africa, tourism, and the nation's port and railway sector have historically been equally important sources of foreign-exchange revenues. While all these sectors declined severely during the 1980s and early '90s because of civil unrest, they began to rebound after the 1992 peace accord, and resource exploitation also increased. The more open political situation also allowed numerous trade unions to develop, many of which participated in the Organization of Mozambican Workers (Organização de Trabalhadores Moçambicanos), a group that has openly criticized the free-market policies of the government.

In both the colonial and postcolonial eras state regulation of the economy was common, but the methods contrasted sharply. Particularly during the 20th century, Portuguese investors were allowed to develop important components of the economy without competition. Only in the post-World War II era were economic decentralization and competitive markets allowed to develop apace. After independence the state was weak, and its efforts to develop and expand the economy through central planning were ineffective and counterproductive.

Economic regulation

Resources. Although much of Mozambique has not been extensively surveyed for minerals and petrochemical resources, from what is known the country has impressive potential energy resources. The Tete highlands in the west-

central region has six billion tons of known bituminous coal reserves, and the Cabora Bassa Dam (Hidroeléctrica de Cabora Bassa) was completed in 1974 to tap the hydroelectric potential of the Zambezi River. Although continuing exploration for oil has been disappointing, large commercially viable natural gas fields were discovered at Panda, north of Inhambane, and are in the early stages of development.

Key known mineral resources include high-quality iron ore reserves and what may be the world's largest reserves of the rare and important mineral tantalite. Tantalite is essential in the global electronics industry and is used to produce top-grade steels. Mozambique's small gold industry is also expected to develop rapidly.

Water resources could potentially compensate for the mixed soil endowment. Mozambique's major river systems provide alluvial deposits and offer both hydroelectric and irrigation potential. The country's forest resources were briefly exploited for both export and local building material during the 1960s and '70s, but significant hardwood forest reserves have survived deforestation for fuel.

Mozambique's offshore waters contain tuna, mackerel, sardines, and anchovies but are best known for the shrimp (prawns) that are an important export commodity. Availability of shrimp, lobster, and shellfish have also contributed to Mozambique's attraction as a vacation beach resort for its inland neighbours. The pleasant climate, beautiful beaches, and Indian Ocean islands are important resources. Mozambique's natural resources remain largely underdeveloped owing to military insecurity and lack of investment capital.

Agriculture, forestry, and fishing. Agriculture contributes about 40 percent of Mozambique's gross domestic product (GDP), but, in most rural areas since the late 1970s, agricultural output has declined steadily. Most agricultural production is undertaken with family labour to produce the two staple crops, corn (maize) and cassava, as well as beans, rice, and a variety of vegetables and oilseeds. Family labour also gathers a large part of the important cashew nut crop and produces cotton, beef, and small stock for the local market and export.

Agricultural exports, such as sugar, tea, citrus, copra, and sisal, were developed as plantation crops during the colonial era and, with few exceptions, continue to be produced on private plantations, state farms, and government-sponsored cooperatives and communal villages, although production of each crop is down from preindependence levels. Irrigation remains limited to schemes developed in the 1950s and '60s in former settler areas in the south, particularly along the Limpopo River. Beef production is important in the drier southern sections of the country. Egg, poultry, milk, and pork production passed from settler to state control after independence, but only egg and poultry production has sustained or surpassed output from the early 1970s.

Since independence the exploitation of timber has declined, though international investors are interested in Mozambique's potential to provide wood for building materials and pulp for paper industries. Today, however, the forests are principally exploited as the nation's key source of domestic fuel, firewood, and charcoal. More timber is cut than is replaced by reforestation initiatives.

Fishing is one area of the economy that rural insecurity has not severely undermined, and, since 1973, production and marketing of saltwater fish, shrimp, and shellfish have increased steadily. Shrimp constitute an increasingly important proportion of foreign-exchange earnings.

Industry. The mining industry in most of Mozambique remains either closed or well below capacity owing to the security situation. The large reserves of tantalite at Murrua had been developed by East German and Soviet interests until the collapse of the Eastern-bloc governments. Investors from several areas, including South Africa, have expressed an interest in pursuing the tantalite deposits.

High-quality iron ore, bauxite, graphite, copper, marble, garnets, asbestos, bentonite, limestone, and sea salt are all mined and quarried in Mozambique. Western European, American, and Japanese investors have all expressed interest in the mining sector. Frelimo reforms regarding international investment and the collapse of Eastern-bloc influence in the region have fueled Western interest.

In 1975 Mozambique's industrial and manufacturing sector was typical of much of colonial Africa, based largely on minimally processed raw materials for export (shrimp, tea, sugar, cashews, citrus, copra, coal, and cotton) combined with processing and light manufacturing for local consumption (milled grains, beer, tobacco, soap, building materials, vegetable oils, and, to a lesser extent, textiles and shoes). A sharp increase in local manufacturing capacity occurred from the late 1950s to the early 1970s in response to consumer demand from the burgeoning urban settler population. The limited development of heavier industry was linked to trade, service, and transportation agreements with the neighbouring countries, such as the metalworking and heavy railway equipment sector. The enormous expansion of cement production was due to the construction of the Cabora Bassa Dam and urban housing fueled by the settler influx.

Despite the exodus of much of the country's skilled labour and managerial class at independence, industrial production increased modestly until the early 1980s, after which point manufacturing and construction ground to a virtual halt. Within 15 years of independence, industrial production had declined by almost two-thirds. War interrupted the supply of raw materials from within the country, and the nation's soaring debt and diminishing exports combined to strangle Mozambique's ability to import spare parts and other inputs necessary to sustain production. Sabotage and power outages exacerbated the situation. By the late 1980s and early 1990s, debt restructuring, negotiations with international creditors, and a somewhat improved business climate for private investors alleviated capital loss and shortages of foreign exchange, enabling businesses to purchase spare parts and capital goods.

On the strength of its resources, Mozambique should be southern Africa's most important energy producer and exporter, but continuing military insecurity has undercut production in all but the case of imported crude oil at the Matola refinery upriver from Maputo. The centrepiece of Mozambique's energy potential is the Cabora Bassa Dam on the upper Zambezi River. It was financed and constructed by an international consortium at the close of the colonial era. It was designed in cooperation with South Africa's national power company, Eskom, to produce electricity for South Africa, not for Mozambique. Upon completion in 1974, only 150 megawatts of the more than 2,000-megawatt capacity were to be consumed in Mozambique; the rest were to travel via the world's longest (870 miles) direct-current line to the Apollo power station in South Africa's industrial heartland. The Portuguese hoped South Africa's interest in the dam would guarantee its support of Portugal during the independence struggle then raging in Mozambique. Since independence, however, Mozambique has increased the national share of ownership in Cabora Bassa, and by the year 2014 it will hold full ownership. The destruction of hundreds of current-line pylons during the postindependence conflict eclipsed the power flow before it was effectively begun. The entire national electrical grid has been targeted by Renamo, frustrating energy-development efforts by forcing cities to build and improve self-contained facilities that do not make the best use of the nation's hydroelectric potential. Cabora Bassa Hydroelectric and two privately run dams on the Revuè River are the principal hydroelectric stations. About 90 percent of Mozambique's electricity is still generated by variously fueled thermal power plants.

The Cabora Bassa Dam

Since the 1980s, Western investors have been attracted to the tourist sector. British and South African investors had important interests in this sector before independence and have recently renewed them.

Finance. In 1978 Mozambique nationalized most of the nation's banking assets. The state consolidated the banking sector into two institutions, Banco de Moçambique, the bank of issue, and Banco Popular de Desenvolvimento (Peoples' Development Bank). To accommodate the shortage of foreign exchange to fund development and eventually to import basic necessities such as food, Mozambique borrowed on the international market to

the point that by the 1990s debt service consumed one-quarter of the nation's annual foreign-exchange earnings. In 1983 Mozambique agreed to join the World Bank and International Monetary Fund and to adopt structural adjustment and national economic recovery programs as a condition for new loans and grants. Private and international investment were encouraged in the new economic climate. International enthusiasm for continued investment hinges on a sustained peace accord between Frelimo and Renamo.

Trade. The most important exports by value include cashew nuts, shrimp, lint cotton, sugar, citrus, copra, timber, tea, and coal. They are sold mostly to the Organization for Economic Cooperation and Development (OECD) nations, among which Spain, the United States, and Japan are the leading consumers. Japan has sharply increased its purchase of Mozambique's exports, while sales to former Eastern-bloc countries have declined.

Trading partners

Food is Mozambique's single largest import by value, followed by equipment, spare parts, and crude oil. Just under half those imports comes from OECD nations, with the United States, Portugal, and Italy providing the largest share. About a third comes from African nations, principally South Africa. The import sector reflects the same pattern of Japanese ascendency and former Eastern-bloc decline revealed in exports. Despite the substantial increase in exports by value since the mid-1980s, imports have vastly outstripped those gains, more than doubling the negative balance of trade. Such patterns are likely to continue if Mozambique is unable to secure rural areas so that refugees can return to agricultural production.

Transportation. Mozambique's transportation sector reflects the nation's historical development in relation to its neighbours. The national road, railway, and port sectors were originally developed by the state and by chartered companies primarily to service the trade and transport needs of Mozambique's western neighbours. East-to-west rail and road systems linking Mozambique's excellent ports with the key industrial and mining areas of South Africa, Zimbabwe, and Malawi are well developed, whereas road and rail systems facilitating north-to-south intra-Mozambique transportation are virtually nonexistent in the case of railroads and minimal with regard to permanent roads. Most of the existing network of internal connecting roads and airstrips in the northern and central areas were developed during the 1960s and '70s as part of Portugal's counterinsurgency strategy. Air transportation has continued to be developed owing to the insecurity of rural roadways.

Mozambique's potential as a transport centre for the interior is on par with its energy capabilities. Its three international ports—Maputo, Beira, and Nacala—are among the best on the continent. Maputo is linked by rail to Swaziland, South Africa, and Zimbabwe. Beira services Zimbabwe by road and rail through what has come to be called the Beira Corridor. It is also linked by rail to Malawi and to the Moatize coal mines near Tete. Nacala's railway extends through Nampula and Cuamba to Malawi, with a leg north from Cuamba to Lichinga.

Ten small local ports dot the coastline from Tambuzi in the north to Inhambane in the south, but only half of those have even limited rail-line links to their hinterlands. The port and railway complex at Maputo was developed at the end of the 19th century in response to the developing gold- and coal-mining industries of Johannesburg and the Transvaal region of South Africa. The colonial state managed to link the mining industry's access to Mozambican contract labour with a commitment to export a substantial fixed portion of the region's mineral exports through Maputo, thus guaranteeing service and customs revenues for the port. Subsequent rail lines linked Maputo with Swaziland and ultimately with Zimbabwe's Gweru (Gwelo) mining area (1955). Maputo has two miles of deep-water wharf and specialized facilities for citrus cold storage, sugar, molasses, coal, and steel. In the 1950s the port and railway administration greatly expanded a specialized industrial port for petroleum, timber, and minerals (iron ore and chromite) 1.5 miles upriver at Matola.

The port of Maputo

The rail links from Beira to Zimbabwe and Malawi were originally developed by the Mozambique Company and taken over by the Portuguese colonial government in 1947. Traffic on the Beira line is dominated by Zimbabwean minerals (chromite, copper, and asbestos) and agricultural products (corn and sugar). With the independence of Zimbabwe in 1980, international investors—particularly British firms—took a renewed interest in rehabilitating and upgrading the Beira Corridor, but the line from Beira to Malawi has been closed because of the war. Beira has about a mile of wharf and special coaling, citrus cold storage, molasses, and tallow facilities.

Nacala, with the nation's best natural harbour and newest facilities, is well placed to serve agricultural development in the north. Malawi developed a new railway line to connect with Nacala's port and railway via Zomba, but attacks on the line forced its closure in the mid-1980s.

Ferry service is available along the lower Zambezi at both Luabo and Marromeu and above Cabora Bassa between Chicoa and Zumbo, which lies near the point where Mozambique meets both Zambia and Zimbabwe. Ferries also serve Lake Nyasa, with Mozambican ports at Metangula and Meponda.

Private aircraft were the first to fly regularly in Mozambique, but after World War II Portugal's national airline, Transportes Aéreos de Portugal (TAP; Portuguese Airlines), opened a route between Beira and Maputo. Eventually colonial Mozambique developed its own airline, Direcção de Exploração dos Transportes Aéreos (DETA; Directorate of Air Transport Exploitation). In 1980 DETA was replaced by Linhas Aéreas de Moçambique (LAM; Mozambican Air Lines), which remains the national carrier. Mozambique's small fleet services national and international routes. LAM has regular scheduled flights to neighbouring capital cities as well as flights to several European capitals and to Rio de Janeiro.

Air services

Expansion of national air traffic is a direct outgrowth of rural insecurity. Airline passenger traffic has developed in inverse proportion to that of the railways and roads,

Michel Huet—HOA-QUI

The port and railway complex at Maputo, Mozambique.

increasing steadily from the late 1970s as road and railway passage declined with the threat of ambush. The country is better served for north-south domestic travel by the airlines than by the more east-west biased road or rail system. Mozambique has 16 airports, of which 2 offer international service.

Administration and social conditions. *Government.* Mozambique is in transition from a single-party state with a strong commitment to socialism to a multiparty system of still uncertain orientation and from a centrally planned, largely state-owned economy to a mixed economy encouraging private ownership and international investment. Both sets of changes will have important implications for Mozambique's government, political processes, and social conditions.

Frelimo

Frelimo led the armed insurgency against Portuguese colonial rule and came to power precipitously in 1975 after brief negotiations with the Armed Forces Movement, which had toppled the government in Lisbon in 1974. Frelimo developed in the early 1960s as one of many socialist-oriented guerrilla groups seeking to overturn colonialism and white minority rule in southern Africa and saw Mozambique's independence as a component of the regional struggle against white domination. That commitment necessarily involved Mozambique in the continuing struggle in Zimbabwe and South Africa.

Mozambique's government was structured by the national constitution, produced by the Central Committee of Frelimo and set forth at independence. Under the constitution Mozambique's president, who was also the president of Frelimo, headed the Council of Ministers, the elected People's Assembly (more than 200 members), and the party's Central Committee. He was also the commander in chief of the armed forces. Since membership in Frelimo was a prerequisite for any political office, the most powerful national and provincial offices tended to circulate among a fairly small group of trusted party members.

The 1975 constitution set forth the spirit of the law. While popular assemblies were in the process of articulating a specific body of legislation, colonial legislation was allowed to stand unless it was specifically judged to contradict the spirit of the new constitution. Legislation and judicial principles and practice evolved piecemeal through the work of popular assemblies and popular tribunals.

In November 1990 a new constitution introduced sweeping changes in the government. Candidates from competing parties were to be elected by universal adult suffrage and secret ballot. The president was limited to three consecutive five-year terms. The constitution established a parliament with limited ability to veto executive action. The new constitution abolished the death penalty and confirmed freedom of the press, the workers' right to strike, and the concept of habeas corpus.

The Assembly of the Republic (Assembleia de la República), the new legislature, contains from 200 to 250 members who are elected to five-year terms by universal suffrage. Among its powers are the ability to ratify the suspension of constitutional guarantees, approve the appointment of the president and deputy president of the Supreme Court, and grant amnesties and pardons.

The judicial system consists of professional judges and elected judges. Professional judges, appointed by the president in consultation with the Supreme Council of the Judiciary, have jurisdiction over matters of law while elected judges are concerned with the primary trial courts.

Mozambique is divided into 10 provinces: Cabo Delgado, Niassa, Nampula, Zambézia, Tete, Sofala, Manica, Inhambane, Gaza, and Maputo; the president appoints the governor of each province. The provinces, in turn, are divided into 112 districts and 894 localities.

Education. The Portuguese educational system was two-tiered—designed to promote rudimentary skills among the majority African population and to provide liberal and technical education for the settler population and a tiny minority of Africans. Nearly 90 percent of students enrolled in the colonial system were restricted to the rudimentary program. The state, in cooperation with the Roman Catholic church, provided public education, but private education was also available, mostly through church groups. The medium for education was Portuguese, but at independence less than 7 percent of the African population was literate in that language.

Education since independence

Private and parochial school facilities were nationalized to facilitate the unification and total overhaul of the educational system. Demand for education quickly outstripped the state's capacity. The number of students at the primary level doubled and at the secondary level tripled. Literacy programs were extended to the adult population at the workplace and in communities. The National System of Education, implemented in the early 1980s, spanned child to adult, part-time to full-time, and literacy to technical educational programs.

The number of secondary schools quickly quadrupled. The number of adult educational and vocational centres doubled. A national university established in 1962 was renamed Eduardo Mondlane University in 1976 to honour the first president of Frelimo. It offers courses through a range of faculties, centres, and schools. Mozambicans trained both abroad and within the national system have increasingly assumed faculty positions, thus diminishing the nation's dependence on foreign faculty. In 1975 the ratio of Mozambican to foreign faculty was about 1 to 30, but by the early 1990s Mozambicans outnumbered foreign faculty at all levels.

The shortage of teachers, teacher dissatisfaction with low salaries, and conditions in refugee camps all tended to undermine the significant educational gains.

Health and welfare. Frelimo expanded and altered the health-care system to meet the needs of the majority population through rural health-care clinics. It changed the emphasis of the health-care system from curative care designed principally to serve the settler population to preventive care aimed at the majority. Frelimo's nationalization of medical services led to an exodus of licensed physicians. Despite initial progress, drought, armed assaults, population displacement, and general economic collapse since the early 1980s have led to a steady decline in the ratio of medical personnel per capita. The single exception is midwives, whose numbers have more than doubled since then. The overall trend has been a sharp decline in health and welfare conditions. The nation's major health problems derive from population displacement and the constraints of a tropical environment. Malnutrition, tuberculosis, cholera, common childhood diseases, a variety of gastrointestinal problems, and tropical diseases such as malaria, leprosy, schistosomiasis, and sleeping sickness are endemic in many parts of the country. By the beginning of the 21st century AIDS was a major health threat.

Cultural life. Mozambique enjoys a great range of cultural and linguistic diversity. Islāmic culture, Swahili language, and matrilineal Bantu-speaking groups coexist in northern and central regions, reflecting prevailing patterns in neighbouring Tanzania and Malaŵi. The great variety of people of the Zambezi valley overlap culturally and linguistically with neighbouring Malaŵi, Zambia, and Zimbabwe, and patrilineal, cattle-keeping people who share a heritage with neighbouring Nguni-speaking groups in South Africa and Zimbabwe are common in the south. Amid the variety of languages, social relationships, artistic traditions, clothing, and ornamentation patterns is a common theme of dynamic and creative cultural expression in song, oral poetry, dance, and performance.

Cultural diversity

Although material and performance arts are deeply embedded in daily religious and social expressions, some regional traditions are well known throughout the nation and beyond. The haunting paintings of Malangatana Valente Ngwenya, commonly known as Malangatana, have captured an international audience. Malangatana and the muralist Mankew Valente Muhumana have inspired the formation of artist cooperatives, particularly around Maputo. The carved wooden sculpture and masks of the Makonde people of northern Mozambique and Tanzania and the complex Chopi orchestral performances, or *midogo,* are among the best-known artistic traditions. Popular music includes the work of Alexandre Langa, Xidimingwana, and the Nampula group Eyuphuro.

Soccer is the nation's favourite sporting activity. Mozambique's soccer team competes with other African nations

and within the Portuguese-speaking Sporting League, which also includes Angola, Portugal, and Brazil.

Publishing

From the first decade of the 20th century, African writers and journalists published their own newspaper in the capital city. Despite problems of colonial censorship, the paper provided a forum for African intellectuals and writers throughout the century. Mozambicans studying abroad during the 1950s contributed to the literary and artistic flowering best known by the French term *négritude.* Writers used the colonial language to convey the experience of the colonized and to reconfirm the validity of African cultural expression. Some of Frelimo's leading figures, such as Marcelino dos Santos and Sérgio Vieira, wrote poetry and encouraged poetic expression as a tool of resistance. Mozambique's best-known writers in Portuguese include Luís Bernardo Honwana, José Craveirinha, and Orlando Mendes. The linguist and short-story author Bento Sitoe writes in Tsonga. The Association of Mozambican Writers sponsors seminars and public readings and publishes for the national market. The publishing group at Eduardo Mondlane University and the Historical Archive publish scholarly journals, monographs, edited collections, archival guides, and collections of documents.

With independence Mozambican cultural institutions underwent a fundamental transformation; although some institutions remain closed, most have eventually reopened in a different form. The Historical Archive of Mozambique, the Museum of the Revolution, the National Money Museum, the Geological Museum, and the Natural History Museum are the principal museums, archives, and libraries.

Despite Frelimo's emphasis on pride in African cultural heritage, its ideology of scientific materialism clashed sharply with important components of that heritage until the late 1980s. Spirituality, herbal and faith healing, rites of passage, direct criticism of leadership through poetic performance, and lineage authority over women all contradicted government efforts to reorder society along socialist lines and to define national culture through government-controlled newspapers, radio, publishing, and television. The government owns and controls most of the printed media, including *Notícias,* the daily national paper; *Tempo,* the weekly magazine; and *Domingo,* the Sunday paper. The Mozambique Information Agency is the country's official national and international news agency. Locally, Frelimo's Office of Mass Communications in Maputo has developed radio messages, murals, and a cartoon figure called Xiconhoca ("Chico the Snake," named after a despised agent of the dreaded colonial secret police), the embodiment of negative social attitudes, to convey its social message and to encourage communication with and among the nonliterate population.

For statistical data on the land and people of Mozambique, see the *Britannica World Data* section in the BRITANNICA BOOK OF THE YEAR.

HISTORY

During the colonial era Mozambique's history was written as though it began with the arrival of the Portuguese, but the people of this region had developed complex communities based on agriculture, cattle keeping, mining, crafts, and trade long before the first small groups of Portuguese settlers arrived in the 16th century. Recent archaeological and historical research has begun to reintegrate Mozambique's past into that of eastern, central, and southern Africa.

Early settlement. From at least the 3rd century AD, Iron Age people who practiced agriculture and kept both cattle and small livestock moved into Mozambique as part of the migration of Bantu speakers from west-central Africa toward the south and east. Bantu speakers of the western African forest zone had mastered iron technology and combined the cultivation of some grains with knowledge of root and tree crops to sustain population growth to the point of expansion. In a slow but fairly steady process, one branch of Bantu speakers moved east toward the Indian Ocean and then south along the coast, and another moved more directly south-southeast into the Zimbabwe plateau and highlands of western Mozambique.

The characteristic social unit was an extended patrilineal household headed by an elder male and including his wives, their unmarried children, adult sons, and the sons' families. Although both social and labour organization varied throughout the area, women usually tended to child care, food preparation, cultivation, and gathering of food crops, whereas men were involved in cattle keeping, hunting, toolmaking, and a range of crafts.

Toward the end of the 1st millennium in south-central Mozambique, groups of households called *nyika* had emerged as social units under the authority of a chief and chiefly household. In the 10th century a settlement known as Mapungubwe, which incorporated many *nyika,* developed in the upper reaches of the Limpopo River. It was the earliest known of the settlements featuring stone enclosures, or *zimbabwes.* Mapungubwe revealed marked social differentiation as early as the 10th to the 11th centuries.

Mapungubwe

The rise of the *zimbabwe* civilizations. The groups of the Zimbabwe plateau expanded their herds and moved between the plateau and the surrounding Mozambican lowlands in pursuit of seasonal pasturage, although the tsetse fly was present in the region. On the Zimbabwe plateau the stone-enclosure settlements reached their peak prosperity. The region's economy was rooted in agriculture and cattle keeping, but its social and political organization became more complex with the development of local industries and trade, specifically the mining of gold, copper, and iron ore and the development of salt pans, tool forges, and potting industries. The civilization of Great Zimbabwe, which dominated the region politically from the mid-13th to the mid-15th century, controlled mining and trade.

The ancient *zimbabwe* settlement at Manekweni, about 30 miles from the Indian Ocean in southern Mozambique, replicated the social and settlement patterns of the highland interior in miniature. Manekweni was a centre for agriculture, cattle keeping, and the gold trade from about the 12th to the 18th century.

From about the 10th to the 18th century, Great Zimbabwe and the area of central Africa around Lake Kisale (in the present-day Katanga province of Zaire) were the region's centres of production and intra-African trade. From at least the 1st millennium, however, people of this region traded with various non-Africans. The earliest and most important external trade link for Mozambicans was with Middle Eastern and Asian people who traded beads and cloth for gold across the Red Sea and Indian Ocean. People of the present-day territory of Mozambique participated in all three trades: the gold and cattle trade of the Zimbabwe highlands; the pottery, salt, and fish trade of the Lake Kisale region; and the bead, cloth, and gold trade between the Zimbabwe plateau and the East African coast.

Growth of external trade

By the 14th century, Afro-Arab, or Swahili, trade cities flourished along the coast from Somalia in the north to Kilwa in southern Tanzania. Smaller Swahili sultanates developed along the northern coast of Mozambique as far south as Angoche, and Arabs traded with Shona, Tsonga, and Yao traders in outposts from Mozambique Island south to Sofala. Early 14th-century pottery from Kilwa and Manda, Swahili city-states hundreds of miles north on the Tanzanian coast, has been found at Chibuene, near Manekweni, confirming that the East African coastal trade extended far into southern Mozambique quite early. By the 16th century, intra-regional trade in raw materials and long-distance trade in gold, copper, ivory, and some slaves sustained a series of markets throughout the region.

Arrival of the Portuguese. The voyage of Vasco da Gama around the Cape of Good Hope into the Indian Ocean in 1498 marked the European entry into trade, politics, and society in the Indian Ocean world. During the early 16th century, the Portuguese established their dominance at Mozambique Island and Sofala. By the 1530s small groups of Portuguese had pushed their way into the interior, setting up garrisons and trading posts at Sena and Tete on the Zambezi River, in an effort to gain exclusive control over the gold trade. The Portuguese attempted to legitimate and consolidate their trade and settlement positions along the Zambezi through the creation of *prazos* (land grants) tied to European occupation.

The *prazos* developed as Afro-Portuguese or Afro-Indian centres defended by large slave armies. Slave trading and Nguni attacks in the first half of the 19th century undermined existing *prazos*, but several heavily fortified *prazos* survived and strongly resisted Portuguese domination until the last quarter of the 19th century.

Between the 16th and 19th centuries control over trade, tribute, and production in central and northern Mozambique clustered around a series of Shona polities south of the Zambezi and Marave polities north of the river. *Prazo* holders and Arab and Portuguese traders all tried to advance their own positions in what remained a fairly fluid situation. The Portuguese were able to wrest much of the coastal trade from Arabs between 1500 and 1700, but with the Arab seizure of Portugal's key foothold at Fort Jesus on Mombasa (now in Kenya) in 1698 the pendulum began to swing in the other direction. During the 18th and 19th centuries the Mazrū'ī and Omani Arabs reclaimed much of the Indian Ocean trade, forcing the Portuguese to retreat south. During the 19th century other European powers, particularly the British and the French, became increasingly involved in the trade and politics of the region.

Effects of the slave trade. By the 18th century, slaves had become an increasingly important part of Mozambique's overall export trade from the East African coast. Yao traders developed slave networks from the Marave area around the tip of Lake Nyasa to Kilwa and Mozambique Island. *Prazo* traders along the Zambezi sold gold and slaves from Zumbo, Tete, and Manica to Portuguese merchants at Quelimane, and Tsonga ivory traders developed routes from the Transvaal and Zimbabwe plateau to coastal entrepôts at Inhambane and Lourenço Marques (now Maputo). During the 19th century, Mozambicans were sold as slaves in the Portuguese and Brazilian South Atlantic trade, the Arab trade from the Swahili coast, the French trade to the sugar-producing islands of the Indian Ocean, and to Madagascar. Although the trade in slaves declined as a result of the mid-19th-century slave-trade agreements between Portugal and Britain, clandestine trade, particularly from central and northern Mozambique continued into the 20th century.

Formation of the Gaza state

During the first 30 years of the 19th century, the proliferation of military and raiding groups from the conflicts in the northern Nguni heartland southwest of Mozambique had an important impact on southern and west-central Mozambique. Several military groups, offshoots of the emerging Zulu state, invaded Mozambican territory, seizing cattle, hostages, and food as they went. The waves of armed groups disrupted both trade and day-to-day production throughout the area. Two groups, one under Zwangendaba and the other under Soshangane, swept through Mozambique. Zwangendaba's group continued north across the Zambezi, settling to the west of contemporary Mozambique, but Soshangane's group crossed the Limpopo into southern Mozambique, where it eventually consolidated itself into the Gaza state. In the 1860s, a succession struggle between the sons of Soshangane caused enormous suffering in the region and weakened the Gaza state.

Consolidation of Portuguese control. The Gaza pattern of raiding groups that refused to pay tribute led some of its neighbours to view alliance with the Portuguese as an attractive alternative to periodic plunder. The Portuguese exploited such tensions. In the 1890s Portugal mounted a coalition of Portuguese troops and African armies against the Gaza state. With the defeat and deportation of Gaza leadership between 1895 and 1897, southern Mozambique passed into Portuguese control.

Trade in ivory, gold, slaves, rubber, oilseeds, and a broad range of European trade goods continued throughout the 19th century. However, European economic interest and influence in the region began to change rapidly in response to developments in both Africa and Europe. By the 1860s people of southern Mozambique began selling their labour at the sugar plantations and ports of South Africa instead of hunting elephants or gathering oilseeds. With the major South African mineral strikes in the 1860s (diamonds at Kimberley) and 1880s (gold at Witwatersrand), European interest in African labour power superseded European interest in African-produced trade goods. With that shift came the European determination to wrest greater control over land and labour from African leadership. The combined struggle for access to mineral-bearing soils and the labour force to work them fueled the so-called "Scramble for Africa" in southern Africa.

Portugal put forth its claim to the entire swath of Africa from contemporary Mozambique to Angola. The Germans, whose territory bordered Mozambique to the north, accepted the Portuguese claims, thus establishing Mozambique's northern boundary. British claims to the region contradicted Portugal's, leading to prolonged negotiations. The Portuguese crown was heavily in debt to British financiers, and the small nation was no match for Britain's military. In 1891 Portugal was forced to bow to Britain's definition of Mozambique's western and southern boundaries.

Contested boundaries

Mozambique's boundaries may have been set through European litigation and diplomacy, but they were fiercely contested by Mozambicans. In the late 19th century there was little to suggest that Mozambique was a united nation. By 1890 the Gaza state was the most influential polity in southern Mozambique. Other important groups included the Barue of central Mozambique, the Afro-Portuguese of the Zambezi *prazos* and the *aringa* of Maganja da Costa, the Yao of Mataka, the Makua chieftaincies throughout the north, and the northern coastal sheikhdoms of Angoche. The Portuguese controlled trade and collected tribute in coastal enclaves from Ibo in the north to Lourenço Marques in the south, but their ability to control events outside these areas was quite limited. From the 1880s to 1917 the Portuguese mounted dozens of military campaigns to extend and confirm their control.

Portugal had little hope of developing the entire region on its own and so turned to the then familiar colonial strategy of leasing great tracts of the area to private companies. Chartered companies were granted the privilege of exploiting the lands and peoples of specific areas in exchange for the obligation to develop agriculture, communications, social services, and trade. The Mozambique Company, the Niassa Company, and the Zambezia Company were established in the 1890s. The limited development and investment in infrastructure that occurred related directly to company interests and were usually undertaken at African expense. Labour conscription for road and railway building, plantation field labour, and the provision of contract labour for the mines and plantations of neighbouring areas superseded slavery in much of the area and promoted social disruption. Sugar, copra, and sisal plantations depended largely on conscript labour, and railways linking Beira with the British South Africa Company territory and British Nyasaland to the west and northwest were built at a high cost to African labour.

The Portuguese government eventually terminated the charters of the major concession companies, bringing all Mozambique under direct Portuguese rule. The most important colonial abuses—forced labour, forced crop cultivation, high taxes, low wages, and alienation of the most promising lands—were as prevalent in areas under direct Portuguese rule as they had been during the companies' rule. Between the 1890s and the 1930s, Portuguese rule in Mozambique was characterized by the exploitation of people and resources by private parties, whether foreign company shareholders or colonial bureaucrats and settlers.

Mozambique under the "New State" regime. The coup of 1926 ushered in a regime in Portugal that came to be known as the "New State" (Estado Novo). Although most of the former abuses in Mozambique continued and in some cases were intensified, the New State consolidated the profit into fewer hands. Protectionist policies instituted in response to the economic crisis of the 1930s gave Portuguese investors and settlers an edge over foreign capital. The administrative and educational systems were unified and developed more coherently under the New State, but they were still principally directed toward settlers. The New State promoted conditions in Mozambique that would allow Portugal and the Portuguese to accumulate capital.

Protectionist policies

Colonial investment patterns began to change in the early 1950s. Portugal set forth a series of development plans designed to extend and upgrade Mozambique's transportation and communications infrastructure. Portuguese who had exploited monopolies and incentives to accumulate capital were encouraged to invest in, expand, and diversify their undertakings. The generally favourable prices for tropical commodities in the postwar era fueled the trend, and the colonial economy expanded quite vigorously. The New State retained tight control over African economic and physical mobility. In the 1950s and '60s thousands of Portuguese settlers arrived to take advantage of employment and business opportunities denied to Mozambicans. By closing off opportunities for the most upwardly mobile, educated, and motivated Africans and maintaining strong discipline and pressure on African farmers and day labourers, Portuguese colonial authorities antagonized Mozambicans across the class spectrum.

By the late 1950s, African leadership emerged from a cross section of the population to channel discontent against the colonial power. The formal political challenge developed among Mozambican workers and students living outside Mozambique because the New State met overt political dissent of any character with imprisonment, death, or deportation. In 1962 Mozambican representatives from exiled political groups met in Tanganyika and forged the Mozambique Liberation Front, or Frelimo (Frente de Libertação de Moçambique).

Formation of Frelimo

Frelimo's strategy was not immediately clear, but, after serious dissent within the organization, the ascendant leadership committed itself to an armed challenge. In September 1964, Frelimo's guerrilla forces, which had been trained and armed by African and Eastern-bloc supporters, attacked targets in northern Mozambique, and the war for independence was launched. Portugal, faced with similar challenges in all its African territories, responded by fielding an enormous military effort. The Portuguese and Frelimo each experienced important victories and setbacks during the ensuing decade of struggle. Although they inflicted some important damage on Frelimo forces, the Portuguese remained frustrated and offensively ineffective against Frelimo's small-scale guerrilla engagements. By 1974 Frelimo forces could move about fairly freely in most of the north and had infiltrated into central Mozambique. The cities, most of the south, and the coastal areas as far north as Nacala remained in Portuguese hands.

On April 25, 1974, the Armed Forces Movement in Portugal staged a coup d'état, which was welcomed by Portuguese discontented with the New State regime, its African wars, and its backward-looking ideology. Frelimo took advantage of its military position to insist on a ceasefire, which confirmed its right to assume power in an independent Mozambique. A quickly aborted countercoup attempt in the capital in September and some rioting in October were the only overt challenges to Frelimo's authority. Within a year of the Portuguese coup, most of the settler population had left Mozambique. On June 25, 1975, Mozambique became independent under Frelimo's single-party rule. (J.M.Pe.)

Independence. *Mozambique as a one-party state.* Mozambicans widely supported Frelimo's decisions to implement economic sanctions against Rhodesia (now Zimbabwe) and to allow guerrilla forces opposed to the Rhodesian government to develop bases in Mozambique, but Mozambique suffered major losses of revenue and lives and the destruction of key infrastructure. Frelimo's support for the African National Congress (ANC) brought similar economic and military retribution from South Africa.

Frelimo had mixed success with its social and economic policies during its first decade of rule. While forced cultivation, forced labour, and ethnic discrimination were ended, the party's commitment to communal and state-run agriculture antagonized many farmers, who had hoped to see land returned to their families. By 1985 Frelimo recognized the failure of its agricultural policy and, under pressure from international creditors, began to favour the family agricultural sector over state-run markets.

The government's extensive investment in education, health care, and services was initially highly successful. Within a decade of independence, however, these gains had been totally undermined by the actions of the Mozambican National Resistance (Resistência Nacional Moçambicana; Renamo), an insurgency group trained, supplied, and supported largely by Rhodesia and South Africa. Renamo began a campaign of terror against the rural population and economic sabotage shortly after independence. A 1984 agreement between Mozambique and South Africa to end support for guerrilla groups did little to curb Renamo's activity, and Frelimo continued its attempts to end the conflict through negotiation.

Renamo's campaign

Mozambique since 1992. The leaders of Frelimo and Renamo finally accepted a peace accord in October 1992, whereby Frelimo's leadership agreed to change the constitution and to open the political process to competing parties in exchange for Renamo's promise to end the war. Issues between the two groups were not totally resolved until 1994, and multiparty elections in that year were the culmination of compromises on both sides. Frelimo ended its one-party rule and Mozambique's identity as a socialist nation. Renamo changed its image as an international pariah known for burning schools and health clinics and became a legitimate political party. Renamo's leader, Afonso Dhlakama, was accepted as a legitimate presidential candidate. Although Frelimo and Renamo were the main contenders in the elections, many other smaller parties also emerged. There were a dozen presidential candidates and a similar number of parties fielding candidates for the National Assembly. The elections were considered free and fair by international observers, with Frelimo president Joaquim Chissano garnering the majority of the votes. Renamo, however, was strongly represented in the national government and the National Assembly.

The new government faced the lingering effects of the war, notably the presence of up to two million land mines in the countryside. The effort to demobilize both Frelimo and Renamo forces and form a new unified military also met with delays and difficulties. In the mid-1990s soldiers waiting in demobilization camps for weeks without food, money, or prospects for work staged scattered violent uprisings. A major concern of the government at the end of the 1990s was how to reform land tenure. (J.M.Pe./Ed.)

For later developments in the history of Mozambique, see the BRITANNICA BOOK OF THE YEAR.

Namibia

The Republic of Namibia (formerly called South West Africa) is a vast (318,580 square miles [825,118 square kilometres]), nearly empty land bordered by Angola to the north, Zambia to the northeast, Botswana to the east, South Africa to the southeast and south, and the Atlantic Ocean to the west. It ranges from arid in the north to desert on the coast and in the east. The landscape is spectacular, but the desert, mountains, canyons, and savannas are perhaps better to see than to occupy.

The only permanent rivers are the Kunene (Cunene), the Okavango (Cubango), the Mashi (Kwando), and the Zambezi on the northern border and the Orange on the southern. Only the northern frontier—and not all of it—is readily passable. The coastal Namib desert, the treacherous reefs and shoals of the coast (half aptly named the "Skeleton Coast"), the near deserts along the Orange River, and the dry Kalahari region to the east explain the late conquest of Namibia and form a geographic frame around the country. Roughly rectangular (600 by 300 to 450 miles [965 by 480 to 725 kilometres]), Namibia has a long, narrow eastern extension (the Caprivi Strip). Namibia became independent on March 21, 1990, under a democratic multiparty constitution. The capital is Windhoek.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Namibia is divided from west to east into three main topographic zones: the coastal Namib desert, the Central Plateau, and the Kalahari. The Namib is partly rocky and partly (in the central stretch) dunes. While having complex flora and fauna, it is a fragile and sparsely covered environment unsuitable for pastoral or agricultural activities. Diamonds (probably washed down

from the Basotho highlands by the Orange River) and uranium are found at Oranjemund in the south and Arandis in the centre. The Namib, 50 to 80 miles wide over most of its length, is constricted in the north where the Kaokoveld, the western mountain scarp of the Central Plateau, abuts on the sea.

The Central Plateau, which varies in altitude from 3,200 to 6,500 feet (975 to 1,980 metres), is the core of the agricultural life of Namibia. In the north it abuts on the Kunene and Okavango river valleys and in the south on the Orange. Largely savanna and scrub, it is somewhat more wooded in parts of the north and is broken throughout by hills, mountains, ravines (including the massive Fish River Canyon), and salt pans (notably the Etosha Pan). Mount Brand (8,445 feet [2,574 metres]), Namibia's highest peak, is located along the plateau's western escarpment.

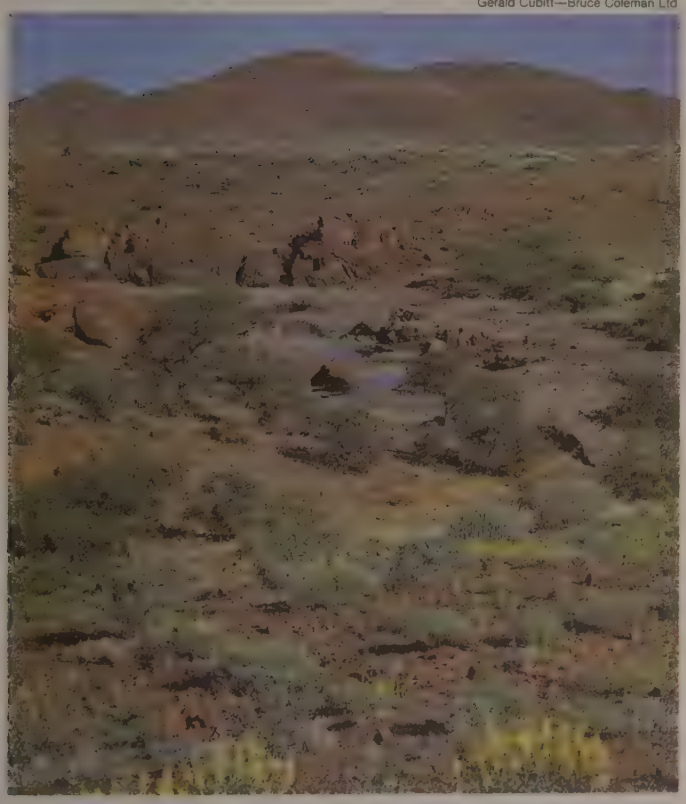
In the east, Namibia slopes gradually downward, and the savanna merges into the Kalahari. In the north, hardpan and rock beneath the sand, in addition to more abundant river water and rainfall, make both herding and cultivation possible.

Intermittent streams

Drainage and soils. As noted, only the border rivers are permanent. The Swakop and Kuiseb rivers rise on the plateau, descend the western escarpment, and die out in the Namib (except in rare flood years, when they reach the sea at Swakopmund and Walvis Bay, respectively). The Fish (Vis) River rises in the Central Plateau and (seasonally) flows south to the Orange. Various lesser rivers rise on the plateau and die out downstream in the Namib or Kalahari desert.

Namibia's soils range from barren sand and rock to low-quality sand-dominated to relatively fertile soils. The best soils are in the north, in the Otavi Mountains, in parts of the central and southern portions of the plateau, and in the Caprivi Strip. Water—not soil fertility—is the primary constraint on agriculture. Both in the densely populated Ovambo region in the north and in the commercial farming areas, overuse of land has reduced tree and bush cover, compacted soils, led to serious erosion, and lowered the water table by as much as 100 feet in the 20th century.

Gerald Cubitt—Bruce Coleman Ltd



The intermittent Uniab River in its rainy-season course downstream from its headwaters on the Central Plateau (near Palmwag) through the rocky terrain and scrub bush of the Namib (heading, if rain persists, to the Atlantic Ocean, near Torra Bay, Namibia).

Climate. Namibia is located on the southern margin of the tropics and has distinct seasons. The coast is cooled by the Benguela Current (which carries with it the country's rich and recovering fish stocks) and averages less than 2 inches (50 millimetres) of rainfall annually. The Central Plateau and the Kalahari have wide diurnal temperature ranges, more than 50° F (30° C) on summer days and less than 20° F (10° C) in winter. In Windhoek, on the plateau, the average temperature for December is 75° F (24° C), and the average maximum 88° F (31° C). In July these averages are 55° F (13° C) and 68° F (20° C), respectively. Humidity is normally low, and rainfall increases from about 10 inches (250 millimetres) on the southern and western parts of the plateau to about 20 inches in the north-central part and more than 24 inches on the Caprivi Strip and Otavi Mountains. However, rainfall is highly variable, and multiyear droughts are common. In the north and adjacent to mountains, groundwater is as important as—but only slightly less variable than—rainfall. Kalahari rainfall—in its Namibian portion—is not radically different from that of the plateau, but, except in the northern Karstveld and isolated artesian areas, groundwater is less available.

Plant and animal life. Both the Namib and Kalahari deserts are characterized by exotic, fragile desert plants. The mountains are sparsely wooded, and the plateau is predominantly scrub bush and grass. Trees are much more frequent in the north. Varieties of aloe are common throughout the plateau and the less sandy portions of the Kalahari.

Namibia is richly endowed with game, albeit poaching has seriously diminished it in parts of the north. Throughout the ranching zone, game (notably antelope and giraffes) coexists with cattle and sheep. The Etosha Pan in the north is a major game area and tourist attraction.

Settlement patterns. Less than 1 percent of the country is estimated to be arable, though almost two-thirds is suitable for pastoralism. Wasteland (mountain and desert) and bush or wooded savanna, plus a small forest zone, constitute the remainder.

Population distribution

About half of the entire population live in the far north, roughly 15 percent in the commercial ranching areas north and south of Windhoek, 10 percent in central and southern ex-black homelands, more than 10 percent in Greater Windhoek, and the remainder in coastal towns and inland mining towns. More than one-fourth of the total population live in urban areas. Namibia's population is young—about half are 16 years of age or younger—and is growing at a relatively modest rate compared with those of other African countries.

The people. *Ethnic and linguistic composition.* About 85 percent of Namibians are black, 5 percent of European ancestry, and 10 percent, in South African terminology, Coloured (Cape Coloured, Nama, and Rehobother). Of the black majority, about two-thirds are Ovambo, with the Kavango, the Herero, the Damara, and the Caprivian peoples following in population size. Other ethnic groups have much smaller populations. Afrikaners and Germans constitute two-thirds and one-fifth of the European population, respectively. Most ethnic Europeans are Namibian citizens, though some have retained South African citizenship.

English is the national language, though it is the home language of only about 3 percent of the population. Ovambo languages are spoken by more than 80 percent of the population, followed by Nama-Damara with about 6 percent. Kavango and Caprivian languages and Herero, as well as Afrikaans, constitute about 4 percent of home languages. Many Namibians speak two or more indigenous languages and at least a little of two of the three European languages (English, Afrikaans, German) in common use.

Religion. Some 80 to 90 percent of the population at least formally adheres to a Christian confession. The largest denominations are two Lutheran churches, which together encompass about one-half the total population. Roman Catholics comprise another one-fifth of the population, while the Dutch Reformed and Anglican denom-

inations each make up small percentages of the total. There are still smaller groups in the African Methodist Episcopal, Methodist, and Presbyterian churches, and a small percentage practices traditional religions.

Demographics. Namibia's population density is among the world's lowest, and about two-thirds of the people live in rural areas. The country's annual population-growth rate is slightly higher than the regional average. Its birth rate is much higher than the world average, and its death rate is almost twice that of the world average. The average life expectancy of about 45 years is down from 56 in the early 1990s, a result of the swift spread of HIV/AIDS. This circumstance has concurrently produced a rapidly increasing number of orphans (more than 82,000 were registered in 2004) who have lost parents to the disease. In part because the disease is easily transmittable to nursing babies, infant mortality remains a serious problem; the overall rate is higher than the average for countries in southern Africa but below that of most countries in sub-Saharan Africa. Two-fifths of the population of Namibia is under 15 years old.

Like almost all other human welfare indicators, the black-white disparity in demographics is very high—a legacy, in large part, of the South African occupation regime's practice of apartheid. Many exiles have returned to the country since independence, whereas some 10,000 Europeans and almost as many black South African hired troops and auxiliaries have departed.

The economy. Nominally Namibia is a lower-middle-income economy with a gross domestic product (GDP) per capita that is significantly above average for countries in sub-Saharan Africa. But that summary is misleading. Only one-quarter of all Namibians and only one-sixth of black Namibians have adequate incomes; up to two-thirds live in abject poverty with limited access to public services. More than a third of the population is unemployed, and overall economic growth is difficult because of a shrinking productive sector, lack of capital stock, and extreme fluctuations in the world market for base metals and uranium oxide.

Problems in economic growth

Agriculture and fishing. Commercial farming (undertaken predominantly by white settlers) was concentrated on the raising of Karakul sheep (sheepskins) and cattle (beef) for export. Crop raising (mostly beans, potatoes, millet, and maize [corn]) is a distinctly secondary activity on commercial farms, but it is almost equal with livestock production on small family farms in the north. Many of the latter operate at below subsistence level and are headed by women. Rural development efforts are aimed at small farmers. From the start of independence the Namibian government has attempted to redistribute enough of the arable land to help eliminate the extremes of rural poverty. White farmers, by most accounts, held well over half the country's arable land. In 1995 the government began what was called a "willing seller–willing buyer" program. If, for example, a farmer held many farms and would be willing to sell off one or some of these, the government had right of first refusal. This program also allowed the government to purchase unused land. But progress in land redistribution was slow, and in 2004 the government announced that it would begin expropriating land, making every effort to give the owners fair compensation.

Commercial fishing (pilchards [sardines], anchovy, hake, horse mackerel, oysters, and mussels) and fish processing (an important source of jobs) are a rapidly growing sector of the Namibian economy.

Mining

Industry. Mining is central to the economy, though the government was attempting to diversify. Extractive industries account for more than one-tenth of the GDP. Gem diamonds, uranium oxide, and base metals dominate mining; however, gold and natural gas are increasingly significant, and oil production (offshore and in the Etosha basin) is potentially so. Namibia supplies nearly one-third of the world diamond output, but the value of this contribution varies with world prices. Uranium and copper are also produced in significant amounts. Other important minerals include fluorite, lead, zinc, cadmium, pyrite, tin, and silver.

Manufacturing produces about one-tenth of the GDP. It is dominated by cut gems, fur products, processed foods, textiles, carved wood products, and refined metals.

The beauty and diversity of the Namibian landscape—especially on the coast, at Etosha, and in Fish River Canyon—combined with the country's relative stability, made tourism an expanding industry in the 1990s, and by the turn of the 21st century it was the fastest-growing sector of the economy.

Finance and trade. Namibia has several commercial banks, but three of them—First National Bank of Namibia, Standard Bank Namibia, and Bank Windhoek—account for most banking business. Reorganization of land, housing, and development banks was begun after independence. The Central Bank of Namibia launched an independent currency, the Namibian dollar, to replace the South African rand in the mid-1990s.

South Africa is by far the largest source of Namibia's imports, supplying food, beverages, and tobacco; machinery; transport equipment; and base and fabricated metals. The United Kingdom, South Africa, Spain, and France are the major export destinations for diamonds and other minerals, processed fish, live animals and animal products, and beverages and other food products.

Transportation. Transportation is dominated by TransNamib, a public-sector rail, road, and airline operator. Transport infrastructure is reasonably good, with main routes through the Caprivi Strip (and thence to Zambia and Zimbabwe) and to Botswana being upgraded. Air Namibia flies to national and regional destinations and to Europe. There is an international airport at Windhoek. A handful of large road-transport companies compete with larger numbers of small haulers.

Administration and social conditions. *Government.* Namibia is a multiparty democracy with a president as head of state. Legislative power is vested in the National Assembly, which consists of 72 members directly elected to five-year terms under universal adult suffrage; the president may appoint up to six additional (nonvoting) members. The work of the assembly is subject to review by the National Council, which is made up of members elected by regional councils.

The constitution

Namibia's constitution, which took effect at independence, is highly rights-conscious and aimed at achieving a durable separation of powers. Arguably, the results have a complexity and rigidity (many clauses literally cannot be amended) that may hamper governance. They represent a compromise in which individual (not group) rights and affirmative action are included in return for a series of safeguards against majority legislative or executive abuse of power and entrenchment of property rights.

The country's armed forces have been formed largely from the military wing of the South West Africa People's Organization (SWAPO), the People's Liberation Army of Namibia. The police forces, which are about the same size as the army, remain primarily a holdover institution from preindependence times, which has led both to a certain lack of confidence in them and to a popular reaction of caution—neither attitude being helpful in controlling Namibia's postwar upsurge in crime.

Namibia was admitted to the United Nations in 1990. It joined several regional organizations, including the Organization of African Unity (now the African Union), the Southern African Development Coordination Conference (now the Southern African Development Community), and the South African Customs Union. The latter membership, which allows the open and duty-free exchange of goods between South Africa and Namibia, is an indication of the pragmatic and largely noncontentious relations the two countries have maintained. Namibia also has membership in a number of global organizations, such as the African, Caribbean, and Pacific (ACP) group of developing nations; the World Trade Organization; the International Monetary Fund; and the Commonwealth.

Education. The government's policy of expanding education to offer universal primary and lower secondary instruction faces severe problems. Most teachers, for example, are far from qualified (not least in the language of instruction, English). Yet more than four-fifths of all

children between the ages of 7 and 18—a figure far higher than in most African countries—are enrolled in school. The student-teacher ratio is also comparatively low, even for southern Africa, which tends to have a lower ratio than most other regions of the continent.

With more than 70 percent of its adult population literate, Namibia has one of the highest rates of literacy in sub-Saharan Africa. Various informal adult education programs have been implemented to combat the remaining illiteracy. Higher education is provided by four teacher-training colleges and a university.

Health and welfare. Most Namibians are poor—more than half are absolutely poor—and nutritional standards are low. As much as one-tenth of the population suffers severe, chronic malnutrition. Formal wage employment engages only a small percentage of the work force, and unemployment is high. Average white incomes are several times higher than formal, waged black incomes, but the non-wage-generated incomes of most blacks fall far short even of this low level.

Namibia has one of the best health-care systems in Africa, as measured by both its population-to-doctor and its population-to-hospital-bed ratios. Emphasis is placed on primary and preventative health services, and the country's system of regional hospitals and mobile clinics has attempted to raise the level of services available in rural locations.

Social policy

Women and children have received special attention in social policy, being the most disadvantaged groups. In the case of women, ending legal and social discrimination and improving access to education, land, and employment are stated goals toward which some action has begun. A detailed government paper laid out ways and means to meet the child health, education, nutrition, and other goals for the year 2000 adopted by the 1990 World Summit on Children.

Cultural life. Namibian cultures are diverse. Just as the culture of the Afrikaners differs significantly from that of the German-speaking community and as both of those cultures differ from that of the more varied technical-assistance community, so do African and Creole cultures differ. The Rehobothers closely resemble the rural Afrikaner culture of the mid-20th century, while the Nama have more in common with the other pastoral black communities, and the "Cape Coloured" have a distinct urban culture with both black and European elements. The northern black cultures—while distinctive as to language and forms of music and dance—formed out of a mixed farming context unlike that of the Damara and Herero. The San are a tragic case. Their culture was ruined by ranch serfdom and wartime exploitation as trackers, and efforts to rebuild from the fragments have been limited by lack of knowledge, resources, and space as well as by the paternalism of many of their self-appointed "guardians."

With the exception of the San, Namibian cultures appear to be alive and evolving, not least in the urban areas. However, rising unemployment may lead to the breakdown of neighbourhood and other social groupings and to the anomie and lawlessness that characterize the townships of many southern African cities, notably in both Zambia and South Africa. The black cultures are not well supported by formal institutions or the government, owing both to doubts as to what would enable rather than smother their development and to a lack of fiscal resources.

A number of holidays and festivals are observed, most of which are religious or historic in significance, albeit not necessarily of specific current content. Sports are popular among both spectators and participants. A wide variety of sports are followed by the white communities, but the black communities concentrate on soccer.

Radio and television broadcasting services are government-owned, as is one daily newspaper. All appear to have substantial intellectual and programmatic freedom. A fluctuating band of party, semi-party, and (in one case) independent newspapers exist and are not subject to censorship, but the survival of most is in doubt for economic reasons. They are supplemented by an array of religious, trade union, and other specialized papers that also have complete freedom of expression.

For statistical data on the land and people of Namibia, see the *Britannica World Data* section in the BRITANNICA BOOK OF THE YEAR.

HISTORY

The history of Namibia is not well chronicled. Its isolated geographic position limited contact with the outside world until the 19th century. Explorer, missionary, trader, conqueror, and settler sources are neither comprehensive, notable for accuracy, nor unbiased. Professional historiography is a post-1960 development in the country, and the political events of the years since then have coloured most of the written history.

Independence before the conquest. The earliest Namibians were San (often pejoratively called Bushmen), nomadic peoples with a survival-oriented culture based on hunting and gathering. Their clans were small and rarely federated, and their military technology was so weak that even before the arrival of the Europeans they had been pushed back to the desert margins.

First conquerors

The first conquerors in southern Namibia were the Nama (of a people often—though not in Namibia—pejoratively called Hottentots). They had a larger clan system, with interclan alliances, and a pastoral economy. Closely linked (usually in a dependent role) were the Damara, a people from central Africa whose culture combined pastoralism, hunting, and copper smelting. In northeastern and central Namibia the Herero (a pastoral people from central Africa) built up interlocked clan systems eventually headed by a paramount chief. The unity of the Herero nation, however, was always subject to splintering. In the north the Ovambo people developed several kingdoms on both sides of the Kunene River. They were mixed farmers (largely because of a more hospitable environment for crops) and also smelted and worked copper. To the east the related Kavango peoples had a somewhat similar but weaker state system. On the margins of Namibia—*i.e.*, the Caprivi Strip in the far east and on the margins of the Kalahari—the local peoples and groupings were spillovers from southern Zambia (Barotse) and Botswana (Tswana).

Until the 1860s, European contact and penetration were slight. Diogo Cão and Bartolomeu Dias touched on the Namibian coast in 1486 and 1488 respectively, en route to and returning from the Cape of Good Hope, but there was virtually no contact until the 1670s. Afrikaner explorers after 1670 and Afrikaner traders and settlers about 1790 came to Namibia and eventually reached the southern boundaries of the Ovambo kingdoms, notably at the Etosha Pan. They—together with German missionaries, explorers of varied nationality, British traders, and Norwegian whalers—did not play a dominant role before 1860. Instead, they created the first avenues for trade (ivory and later cattle) and introduced firearms.

The latter heightened the destructiveness of conflicts among the various clans and peoples. So did the arrival, after the first quarter of the 19th century, of the Oorlam-Nama from the Cape. Their military technology (which included horses, guns, and a small mobile commando organizational pattern) was modeled on that of the Afrikaners. They came to dominate the resident Nama (Red Nation) and Damara. In the middle of the 19th century, a kingdom ruled by the Oorlam but partly Herero and supported by the Red Nation and Damara was established near Windhoek by the Oorlam chief Jonker Afrikaner.

Central Namibia was then an area of conflict between the southward-moving Herero and the northward-migrating Nama. In 1870 a peace treaty was signed with the Germans on the border of Herero country. Meanwhile, largely as a result of war pressures, Maherero had emerged as the Herero paramount chief. At this time a South African Creole ("Coloured") community, the Rehoboth Basters, had immigrated to a territory south of Windhoek, where they served as a buffer between the Herero and the Germans. Like the Oorlam, they were Europeanized in military technology as well as civil society and state organization, which were copied from the Afrikaners.

The German conquest. In the 1870s, British annexation of Namibia appeared imminent. A treaty with the Herero and the raising of the British flag over Walvis Bay were

seen as forerunners of the northward expansion of the Cape Colony. However, London proved reluctant to take on added costs in an apparently valueless area, and the way was left open to German colonial annexation as South West Africa in the 1880s. The acquisitions, by exceedingly dubious "treaties" and more naked theft, did not go smoothly, despite the employment of so-called "divide and rule" tactics within and between peoples. The first major resistance—by the Herero in 1885—forced the Germans back to Walvis Bay until British troops were sent out.

By the turn of the century, German settlers had arrived, copper was minable, railway building from Swakopmund and Lüderitz was under way, and diamonds were soon discovered near Lüderitz. But from 1904 to 1907 a great war of resistance broke out, nearly expelling the Germans before it was quelled with extreme savagery by tactics including extermination, hangings, and forced detention in concentration camps.

War against the Herero

The first phase of the war was fought between the Germans and the Herero (with a single Ovambo battle at Fort Namutoni near the Etosha Pan). It reached a climax when General Lother van Trotha defeated the main Herero army at the Battle of Waterburg and, taking no prisoners, drove them into the Kalahari, where most died. By 1910 the loss of life by hanging, battle, or starvation and thirst—plus the escape of a few to the Bechuanaland protectorate—had reduced the Herero people by about 90 percent (80–85 percent dead, 5–10 percent in exile). The Nama resistance war came late because a key letter from Maherero's son and successor, Samuel Maherero, to the Oorlam chief Hendrik Witbooi that proposed joint action had been intercepted. The resistance was finally crushed in 1907, and Nama survivors were herded into concentration camps. War, starvation, and conditions in the camps claimed the lives of two-thirds of the Nama.

The Germans allocated about half of the usable—and apparently all of the best—ranchland (except that of the Rehoboth Basters) to settlers and restricted Africans to reserves. The Tsumeb copper and zinc mines opened in 1906, and diamond mining (more accurately, sand sifting) began near Lüderitz in 1908 and at the main fields at the mouth of the Orange River (Oranjemund) a few years later. Railways linked Lüderitz, Keetmanshoop, and Windhoek as well as Swakopmund, Windhoek, and Tsumeb.

German direct rule never extended to the north. The "red line"—now a quarantine boundary—delimited the Police Zone from the Ovambo and Kavango areas. In the latter, the near extinction of elephants, a rinderpest epidemic, and the rising consumption habits of the kings led to a migration of single male contract labourers to work in the mines and ranches and in construction. "Contract"—which was to provide the cheap labour for the colonial economy and later provided the national communication and solidarity links to build the liberation movements of 1960–90—had begun.

The Boer conquest. In 1914–15 South African troops invaded and captured South West Africa as part of the World War I conquest of the German colonies in Africa. Except for diamond mines, most property—including Tsumeb—found its way back into German hands. The rising De Beers colossus bought Oranjemund and the balance of the diamond-producing area to bolster its world domination; it was used as a market-balancing mine (that is, its production was varied to control the price of diamonds, and it was totally closed for more than two years in the 1930s), a role it played into the 1980s. Afrikaner settlers were encouraged to come to South West Africa for security reasons—to hold the inhabitants in check—at least as much as for economic reasons.

The League of Nations mandate

The League of Nations awarded a Class C mandate (meaning no real targets for development of the people toward independence were intended) to the crown of Great Britain to be exercised by the Union of South Africa authorities. That "sacred trust" was read as justifying settlement, greater exploitation, and no rights for black (and precious few for Coloured) Africans, plus a creeping annexation into South Africa as a "fifth province." The rail system was extended to Walvis Bay (the one good natural port) and south to the South African border and to Capetown to tie South West Africa's economy to South Africa's on both the import and export sides.

South Africa extended direct rule to the Kunene and Okavango rivers—parallel to a Portuguese push south to the Angola-Namibia border. Resistance there and elsewhere in South West Africa flared into violence repeatedly until the 1930s, while trade union organizing and political as well as economic resistance began in the 1920s. Until 1945 South West Africa was not a productive colony—cattle and karakul were in oversupply, diamond output was held low, and export prices for base metals were not attractive. Governance, security, and settler survival all had to be financed in large part from Pretoria.

The political economy of a colonial boom. From 1945 the economy of South West Africa grew rapidly, reaching a peak of more than $1,000 per capita ($20,000 for Europeans and $150 for black Namibians) in the late 1970s. The pillars were base metal expansion at better prices, sharply increased output and prices for cattle (largely in South Africa), karakul (via South Africa to the European–North American fur market), and diamonds. Fourfold growth in world demand after World War II led to increases in output at De Beer's diamond mines. In addition, the fish catch (largely for fish meal and canned pilchards) exploded to 1,102,000 short tons (1,000,000 metric tons)—a level that laid the groundwork for the present stock depletion and conservation problems.

The economic gap

The European enclave boomed. The situation was quite different for the other 90 percent of the people. Rising population was eroding productive capacity—per capita and absolutely by ecological damage—in African areas. Until the late 1970s, contract labour paid only enough to support a single person at subsistence level. Black nurses, teachers, and secretaries, as well as semiskilled workers, began to be trained and employed on a significant scale only in the mid-1970s. Land reallocations increased contract labour. A body called the Odendaal Commission organized separate development, which led to the creation of "homeland" authorities that benefited a new black elite (as in the 1980s did government wages and salaries for teachers, nurses, and black-area administrators and troops and a wage increase by large employers in mining and finance). A rising proportion of black Namibians—two-thirds by the late 1980s—was left in abject poverty. Further, contract labour eroded the social and civil structures, giving rise to numerous usually very poor female-headed households in the "homelands" and the urban peripheries.

From resistance to liberation struggle. From 1947, Namibians (initially via intermediaries) had begun to petition the United Nations against South African rule. A series of cases before the International Court of Justice (World Court)—the last, in 1971, declaring the mandate forfeiture by the United Nations in 1966 to be valid—led to a de jure UN assumption of sovereignty and de facto support via publicity, negotiation, and training for Namibian liberation.

In South West Africa the churches (numbering at least 80 percent of black Namibians in their membership) took an early lead in petitioning the UN and South Africa and created a climate of black social and civil opinion favourable to the liberation struggle; they were slow, however, to endorse its armed phase. From the 1950s to the 1970s the churches had become increasingly national in staff and outlook, in some cases after severe conflicts with the overseas "parent" bodies and local missionaries.

Black trade union activity (illegal until the mid-1980s) began to revive as well and focused rather more on political than on economic mobilization. The major strike of 1971–72 was against contract labour, the implementation of apartheid, and the 1966 failure of the initial World Court case as much as it was for wage increases per se.

Formation of SWAPO

From 1958 to 1960 the political focus turned from resistance to liberation, and leadership passed from traditional chiefs to party leaders. SWAPO (nominally South West Africa People's Organization, although only the acronym has been used since 1980) was founded as the Ovamboland People's Organization in 1958; it achieved a national following as SWAPO in 1960. In 1959 SWANU (South West Africa National Union) was formed, largely

by Herero intellectuals. Within a decade, SWAPO had become the dominant party and had grown beyond its Ovambo roots. The presence of Ovambo throughout the nation due to contract labour was used to forge a national communication system and mobilizing capacity.

The parties had been formed because petitioning seemed ineffective. The forced removal (with violence and deaths) of black Namibians from the Old Location in Windhoek to the outlying township of Katatura (sometimes translated as "The Place We Do Want to Be") was perhaps the key catalytic event. Until 1966 the parties sought—in the face of increasing repression—to press for redress of grievances from South Africa and via the United Nations. Indeed, until the 1970s the armed struggle, then largely across the border from Zambia, was only a minor nuisance to South Africa.

The 1971–72 strike marked a turning point in terms of national solidarity and nationwide participation in the struggle. It greatly alarmed South Africa; a rising crescendo of trials and summary imprisonment and torture was pursued, though this process had already begun when Herman Toivo ja Toivo and most other SWAPO leaders not already in exile were tried for terrorism and sent to Robben Island in 1968. From 1969 SWAPO had operated along almost all of the northern border—an operation that was easier after Angolan independence in 1975—and in the north-central farming areas around Grootfontein. Although set back by an internal leadership crisis and division among fighting cadres in 1976, the armed struggle had become militarily damaging and economically costly to South Africa by the end of the 1970s.

The road to Namibia. From 1977 through 1988, the economy of Namibia stagnated overall and fell by more than 3 percent per year per capita. Five factors influenced this: six years of drought, decline in fishing yields because of overfishing, serious worsening of import-export price ratios, the slow growth and mismanagement of the South African economy, and the impact of the war on the budget and on both domestic and foreign investor confidence. For white residents, real incomes (except in ranching) stagnated or rose only slowly; for blacks, they rose for perhaps one-sixth of households in wage employment with government or large enterprises and declined rapidly for others, especially for residents of the northern "operational area" (war zone).

For South Africa, Namibia turned from an economic asset to a millstone (with a war bill by the late 1980s on the order of $1 billion a year—comparable to Namibia's gross domestic product). Capital stock was run down, and output of all major products—beef, karakul, fish, base metals, uranium oxide, and diamonds—fell.

On the domestic side a long series of South African attempts to build up pro-South African parties with substantial black support failed even when trade unions were legalized, wages raised, and petty apartheid laws (including abolition of the contract labour and residence restrictions) relaxed. Indeed, after the failure of the Smith-Muzorewa alliance in the Zimbabwe independence elections, South Africa's internal political maneuvers looked increasingly desperate and lacking in conviction.

International response

Internationally and militarily, decline was slower and less apparent. While the UN had passed Security Council resolutions (notably resolution 435) demanding independence, South Africa skillfully protracted negotiations and played on U.S. fears of communism and paranoia about Cuba (whose troops had defeated the 1975 South African invasion of Angola and remained there to augment the defense against South Africa and its Angolan allies or proxies) to cause repeated, time-consuming stalemates.

Through 1986 about 2,500 South African soldiers had died, a figure proportionally higher per capita than the U.S. death toll in Vietnam. However, the South African government skillfully disguised the high casualty rate as well as the fiscal burden of the Namibian occupation and the forward policy in Angola. The war, like the negotiations, appeared stalemated.

The turning point came in 1988. South Africa's invasion of Angola was defeated near Cuito-Cuanavale; air control was lost; and the Western Front defenses were tumbled back to the border (by a force consisting largely of units of SWAPO's People's Liberation Army of Namibia [PLAN] under Angolan command). By June, South Africa had had to negotiate a total withdrawal from Angola in order to avoid a military disaster, and by the end of December it had negotiated a UN-supervised transition to elections, a new constitution, and independence for Namibia.

(R.H.Gr.)

Independence. The United Nations Transition Assistance Group (UNTAG) opened operations in April 1989. After a disastrous start—in which South African forces massacred PLAN forces seeking to report to UNTAG to be confined to designated areas—UNTAG slowly gained control over the registration and electoral process in most areas.

The 1989 election

The election of 1989, held under the auspices of the UN, gave SWAPO 57 percent of the vote and 60 percent of the seats. Sam Nujoma, the longtime leader of SWAPO, became president. With two-thirds majorities needed to draft and adopt a constitution, some measure of reconciliation was necessary to avoid deadlock. In fact, SWAPO and the business community—as well as many settlers—wanted a climate of national reconciliation in order to achieve a relatively peaceful initial independence period.

As a result, a constitution emphasizing human, civil, and property rights was adopted unanimously by the end of 1990, and reconciliation with settlers and (to a degree) with South Africa became the dominant mood. For the new government, the costs of reconciliation included retaining about 15,000 unneeded white civil servants, deferring the landownership and mineral-company terms issues, and offering de facto amnesty for all pre-independence acts of violence (including those of SWAPO against suspected spies and dissidents in Angola in the late 1980s); the benefits were the takeover of a functioning public administration and economy (with growth rising to 3 percent in 1990) and grudging but real South African cooperation on fishing and use of Walvis Bay. Above all, South Africa forebore from mounting destabilization measures or creating proxy armed forces.

On March 21, 1990, the South African flag was lowered and Namibia's raised at the National Stadium; Namibia subsequently joined the Commonwealth, the United Nations, and the Organization of African Unity. Diplomatic relations were established with many countries. The Namibian Defense Force—which included members of PLAN as well as the former South West African Territory Force—was created with the assistance of British military advisers.

South Africa agreed to a transition to Namibian sovereignty over Walvis Bay, which was effected in 1994. It also agreed to a revised boundary along the Orange River, giving Namibia riparian rights; the earlier border had been placed on the north bank and thus left Namibia without water rights. Namibia remained a member of the Southern African Customs Union.

The political climate remained calm. The main opposition party, the Democratic Turnhalle Alliance (heir to South Africa's puppet government efforts and beneficiary of considerable South African funds for campaigning), held almost one-third of the seats in the legislature but was neither particularly constructive nor totally obstructive. In the 1994 national elections, SWAPO consolidated its hold on power, surpassing the two-thirds majority needed to revise the constitution.

SWAPO maintained its hold on power in the country's 1999 elections, despite allegations from the opposition—now headed by a SWAPO splinter party, the Congress of Democrats—that the government was engaging in authoritarian practices. While opponents questioned several of the government's decisions—its support of the Congolese (Kinshasa) government by sending troops into the country in 1998 and its 1999 support of the Angolan government when it allowed government troops to pursue Angolan rebels into Namibian territory—other internal issues continued to be significant, such as Namibia's increasing number of AIDS cases and its continuing debate over the question of land reform. (R.H.Gr./Ed.)

For later developments in the history of Namibia, see the BRITANNICA BOOK OF THE YEAR.

South Africa

The Republic of South Africa, the southernmost state on the African continent, has an area of 470,693 square miles (1,219,090 square kilometres). It measures almost 1,000 miles (1,600 kilometres) from north to south, as well as from east to west. South Africa is bordered by Namibia to the northwest, by Botswana and Zimbabwe to the north, and by Mozambique and Swaziland to the northeast and east. Lesotho, an independent constitutional monarchy, is entirely surrounded by South African territory in the eastern part of the republic. South Africa's coastlines border the Indian Ocean to the southeast and the Atlantic Ocean to the southwest. The capitals are Pretoria (executive), Cape Town (legislative), and Bloemfontein (judicial).

South Africa is relatively isolated, distant even from major African cities such as Nairobi, Kenya (more than 1,500 miles away), and Lagos, Nigeria (more than 2,400 miles away); it is 5,100 miles from South America, 4,700 miles from Australia, and more than 6,000 miles from most of Europe, North America, and eastern Asia, where many of its major economic links lie.

The four original provinces of South Africa—Cape of Good Hope, Orange Free State, Transvaal, and Natal—were reorganized in 1994 into nine new provinces: Western Cape, Northern Cape, Eastern, North-West, Free State, Gauteng, Eastern Transvaal, Northern, and KwaZulu/Natal; Eastern Transvaal subsequently was renamed Mpumalanga. South Africa possesses two small subantarctic islands, Prince Edward and Marion, situated in the Indian Ocean about 1,200 miles southeast of Cape Town. The former South African possession of Walvis Bay, an enclave on the Atlantic coast some 400 miles north of the Orange River, was transferred to Namibia in 1994.

South Africa has long been a focus of world attention. The former South African government, dominated by the minority white population, maintained a policy of apartheid ("apartness") that enforced segregation between government-defined races in housing, education, and many other spheres of life. Apartheid evoked vehement opposition internally and from most countries in the world. In 1990 the South African government began repealing the apartheid laws, initiating the transition to government led by the black majority. This process culminated in the permanent nonracial constitition promulgated in 1997.

(A.Ne./D.F.G./A.S.Ma.)

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* A plateau that covers the largest part of the country dominates the topography. It is separated from surrounding areas of generally lower elevation by the Great Escarpment. The plateau consists almost entirely of very old rock of the Karoo (Karroo) System, which formed from the Late Carboniferous Epoch (320 to 286 million years ago) to the Late Triassic Epoch (230 to 208 million years ago). The plateau is generally highest in the east, dropping from elevations of 8,000 feet (2,440 metres) in the basaltic Lesotho region to 2,000 feet in the sandy Kalahari in the west. The central part of the plateau comprises the Highveld, which is between 4,000 and 6,000 feet in elevation. South of the Orange River lies the Great Karoo region.

The Great Escarpment

The Great Escarpment, known by a variety of local names, forms the longest continuous topographic feature in South Africa and provides scenery of great beauty. It runs southward from the far northeast, where it is generally known as the Transvaal Drakensberg (*berg* and *berge* in Afrikaans means "mountains"). Farther south it forms the boundary first between KwaZulu/Natal and Free State and then between KwaZulu/Natal and Lesotho. There it reaches heights up to nearly 11,000 feet, including some of the country's highest peaks, such as Mont aux Sources (10,823 feet [3,299 metres]); it is known both as Khahlamba (in Zulu) and as the Natal Drakensberg. The mountainous escarpment continues southwestward, dividing Lesotho from the Transkei region of Eastern province. At lesser altitudes of 5,000 to 8,000 feet, it runs westward across Eastern province, where it is known as the Stormberg. Farther to the west, with names such as the Nuweveld Range and the Roggeveld Mountains, it forms the approximate boundary between Northern Cape and Western Cape provinces. At its western extreme, in the vicinity of Mount Bokkeveld and Mount Kamies (5,600 feet), the escarpment is not well defined.

An area of very old folded mountains with altitudes between 3,000 and 7,600 feet lies in the southwest of the country; it includes ranges such as the Tsitsikama, Outeniqua, Great Swart, Lange, Seder, Drakenstein, and Hottentots Holland Mountains, as well as Table Mountain and its associated features at Cape Town.

Both above and below the Great Escarpment, the topography tends to be relatively broken. Open plains are relatively rare, occurring mainly in northwestern Free State and farther to the west and in smaller areas such as the Springbok Flats north of Pretoria. Ridges, mountains, and deeply incised valleys are common, mainly left by the erosion of very old landforms. Between the escarpment and the sea there is little genuine coastal plain, with exceptions in northern KwaZulu/Natal, where it reaches 50 miles in width, and in parts of Western Cape. For most of its 1,836-mile length, the coastline is characterized by fairly steep slopes rising rapidly inland. Most of the coastline has experienced uplift or falling sea levels in the recent geologic past, with the result that few flooded river valleys or natural harbours occur. Exceptions include the Knysna Lagoon in Western Cape and the Buffalo River at East London. Long stretches of beach are common. In KwaZulu/Natal, longshore drift over many centuries has created spits and bluffs from beach sand; in a number of places these features have enclosed bays, which have provided both remarkable sanctuaries for wildlife (as at the St. Lucia estuary) and, when mouths are dredged, good harbours (as at Durban and Richard's Bay).

Drainage. The greater part of the country (about 329,000 square miles) is drained to the Atlantic Ocean by the Orange River, which rises in the Lesotho Highlands, and its tributaries. Chief among the latter are the Caledon and the Vaal. North of the Witwatersrand ridge, the plateau is drained to the Indian Ocean by the Limpopo system, with major tributaries in the Krokodil, Mogalakwena, Luvuvhu, and Olifants rivers. South of the Olifants River, the area between the escarpment and the sea is drained by a large number of other river systems, such as the Komati, Pongola, Mfolozi, and Mgeni, the largest of which is the Tugela, draining much of KwaZulu/Natal and ranking as the largest river by volume in the country. To the south the Mkhomazi, Mzimvubu, Great Kei, Great Fish, Sundays, and Gourits rivers drain significant areas; the Western Cape fold mountain region is drained mainly by the Breë, Berg, and Olifants rivers. All South African rivers are highly seasonal in flow, and few offer enough gradient and volume to allow navigation by even small craft for more than a few miles from the river mouths.

Orange River drainage pattern

Soils. Three major soil regions may be distinguished. East of approximately longitude 25° E, soils have formed under wet summer and dry winter conditions, the more important types being laterite (red, leached, iron-bearing soil) and other lateritic soils, unleached subtropical soils, and gleylike (*i.e.,* bluish gray, sticky, and compact) podzolic soils (highly leached soils that are low in iron and lime). A second major region lies within winter and all-season rainfall areas in Eastern and Western Cape; its soils are generally gray sandy and sandy loam in type. Over most of the rest of the country, which is generally dry, soils are characterized by a sandy top layer, often a sandy loam, underlain by a layer of lime or an accretion of silica. With some exceptions, South Africa's soils are not characterized by high fertility, and those that are—for example, in coastal KwaZulu/Natal—tend to be easily degraded.

Climate. The climate is varied but affected by three main factors. First, South Africa's location between latitudes 22° and 35° S places almost the entire country within the temperate zone; extremes of heat and cold are rare. However, its location next to a subtropical high-pressure belt of descending air produces stable conditions unconducive to rainfall over most of its surface. The result is a generally dry climate.

Second, most of the country lies at fairly high elevations,

which tempers the influence of latitude and makes even the tropical and near-tropical inland areas much cooler than would otherwise be the case. High elevation and lack of the moderating influence of the sea give most inland areas large daily variations in temperature.

Third, the climate is greatly influenced by the ocean that surrounds the country to the east, south, and west. The temperate cyclones of the southern ocean exercise considerable influence on weather patterns, especially in winter, when their circulation moves northward. The cold, northward-flowing Benguela Current not only cools the west coast considerably but also contributes to the dryness and stability of the atmosphere over the western parts of the country, while the warm, southward-flowing Mozambique and Agulhas currents keep temperatures higher on the east and southeast coast. The resultant warmer and less dense air rises more readily, facilitating the entry of rain-bearing clouds from the east.

Influences of the subtropical high-pressure belt

South Africa, as well as the adjoining ocean areas, is influenced throughout the year by descending, divergent upper air masses that circulate primarily eastward, generally causing fine weather and low annual precipitation, especially to the west. During winter (June to August), cold polar air moves over the southwestern, southern, and southeastern coastal areas, sometimes reaching the southern interior of the country from the southwest. These polar masses are accompanied by cold fronts as well as by rain and snow. In summer (December to February), the Atlantic high-pressure system settles semipermanently over the southern and western parts of the country. Local heating of the landmass sometimes causes low-pressure conditions to develop, resulting in tropical air masses being drawn in from the Indian Ocean over the northeastern region and bringing rain.

South Africa is a generally semiarid country where farmers often face water shortages. More than one-fifth of the country is arid, receiving less than 8 inches (200 millimetres) of rainfall annually; almost half is semiarid, receiving 8 to 24 inches. In most of these areas, rainfall is highly variable and generally unreliable. Only 6 percent of the country receives more than 40 inches of rain annually. From east to west there is a gradual decline in the rainfall. The KwaZulu/Natal coast receives more than 40 inches annually, Kimberley approximately 16 inches, and Alexander Bay on the west coast less than 2 inches.

Summers are warm to hot, with daytime temperatures generally from 70° to 90° F (21° to 32° C). Higher elevations have the lower temperatures, while the far northern and northeastern regions and the western plateau and river valleys in the central and southern regions have the higher temperatures. At night, temperatures fall substantially in the interior—in some places by as much as 30° F (17° C)—while on the coast the daily range is much smaller. Winters are mostly cool to cold, with many high-elevation areas often having temperatures below freezing at night but readings of 50° to 70° F (10° to 21° C) in the daytime. On the eastern and southeastern coast, winters are warm. Temperatures generally decline from east to west: Durban has an annual average temperature of 69° F (21° C), while Port Nolloth—at a similar latitude but on the west coast—registers 57° F (14° C).

Plant and animal life. Natural vegetation varies from savanna (parklike grassland) in the Bushveld and Lowveld of Mpumalanga and Northern provinces through grassland with fewer trees in the Highveld to scrub and scattered bush in the Karoo and drier western areas. Western Cape has a distinct vegetation of grasses, shrubs, and trees able to withstand the long, dry summers and is the home of many of South Africa's 20,000 species of flowering plants. The eastern coast has a more tropical plant life. Natural forest is limited to mountainous valleys along the Great Escarpment and a few other favoured localities.

South Africa has a rich and varied mammal life, with more than 200 species, including large animals such as lions, leopards, elephants, rhinoceroses, hippopotamuses, baboons, and many kinds of antelope. Smaller creatures include mongooses, jackals, and various cats. However, the numbers of animals declined greatly during the expansion of white settlement in the 18th and 19th centuries, and today large indigenous mammals occur mainly in wildlife reserves, of which Kruger National Park is the best known. There are more than 800 species of birds, many species of reptiles, including more than 100 snake species, and an extraordinary diversity of insects. (A.Ne./A.S.Ma.)

South Africa contains more than a dozen national parks, including Kgalagadi Transfrontier Park, formerly Kalahari Gemsbok Park, which was joined with Botswana's Gemsbok National Park to create a transnational park. The largest, Kruger National Park in Northern and Mpumalanga provinces, is noted for its populations of rhinoceroses, elephants, and buffalo. Mountain Zebra National Park in Eastern province shelters the endangered mountain zebra; Addo Elephant National Park, also in Eastern, protects more of the elephant population; and Bontebok National Park in Western Cape contains the endangered bontebok (a type of antelope). Regulated big-game hunting is allowed in the country from May until July for elephants, white rhinoceroses, lions, leopards, buffalo, and many types of antelope. Grysbok, klipspringers, and red hartebeests (all of them varieties of antelope), giraffes, black rhinoceroses, pangolins (anteaters), and antbears are specially protected animals that cannot be hunted. (Ed.)

Settlement patterns. More than nine-tenths of the people live in the eastern half of the country and in the southern coastal regions. The western parts, except for the area around Cape Town in the extreme southwest, are very sparsely populated. More than half the population lives in urban areas, and many of those live in or around the major cities. About half of the black population is concentrated in the former "homeland" areas, scattered territories in the northern and eastern parts of the country that were established during the apartheid period as segregated living areas for Africans. Far from urban facilities, some of these areas exhibit urban, rather than rural, population densities.

White conquest and changing land tenure

Rural land is predominantly owned today by whites but was historically settled by blacks in much of the country. Traditional African settlements consisted of commonly owned farming homesteads or villages (kraals). Conquest and the establishment of white authority and private ownership of land made these settlement patterns subordinate to others, and in the modern period about one-sixth of the African population came to live on farmland owned by whites.

Rural patterns created by white settlement from the late 17th century differ in being centred around single homesteads, usually considerable distances apart, each having its associated cluster of sharecroppers', tenants', or employees' houses. As the frontier of white settlement expanded in the 18th and 19th centuries, the establishment of farms often involved each farmer claiming several thousand acres, resulting in a dispersed settlement pattern with homesteads sometimes miles apart. Smaller farms and more intensive cultivation, however, always existed in some areas, such as the grape-growing areas of the southwest. From the late 19th century, as the urban demand for food and other agricultural produce grew rapidly, many farms closer to towns or in more favourable ecological zones were subdivided, and a denser pattern emerged. More recently there has been a general tendency for farm sizes to increase as the number of landowners has declined.

Urban settlement in South Africa originated both with the concentration of population around the political centres of African chiefdoms and kingdoms and with the towns established by European colonizers. The general defeat of African polities by whites and their allies, particularly during the 19th century, led to the abandonment or destruction of capitals such as Dithakong, a Tswana stronghold in what is now Northern Cape, and Ulundi, the Zulu citadel in northern Natal (now KwaZulu/Natal).

European colonization of South Africa began with towns, Cape Town being the first, in 1652. Under Dutch rule, a few Dutch colonial towns were established in the south and southwest, including Stellenbosch, Tulbagh, Graaff-Reinet, and Swellendam. Once British rule began at the start of the 19th century, new towns were created more rapidly, such as Port Elizabeth, Grahamstown, Beaufort West, and Durban. The Great Trek of dissatisfied farmers

and townspeople away from British rule, which commenced during the 1830s, led to a range of new, mainly small urban centres in the interior focused on church and government: such places included Winburg, Pietermaritzburg, Potchefstroom, Bloemfontein, and Pretoria.

Cape Town

Until the 1860s all South African towns were small; the largest, Cape Town, had a population of less than 40,000 in 1865. Urbanization accelerated rapidly from the 1870s as railway building, mining, and economic expansion proceeded. The population of the Cape Town metropolitan area reached 130,000 by the beginning of the 20th century, by which time Johannesburg (established in 1886) had surpassed its size. Continued rapid growth since then has created four major urban concentrations. Of these by far the largest is the Pretoria-Witwatersrand-Vereeniging complex, centred on Johannesburg, radiating about 45 miles in each direction, and now mostly falling into Gauteng province. The Durban area forms the second largest urban region, followed by that centred on Cape Town and the Port Elizabeth–Uitenhage area in Eastern province, the smallest of the major industrial centres. The major centres in these metropolitan areas offer the full range of services that cities of their size offer in other countries, but all show great disparities of income and access to urban services between the wealthiest, predominantly white, areas and the poorest, exclusively black, districts.

Outside these major metropolitan areas, most South African towns are small and serve either mining communities or surrounding rural areas. Between these extremes are several cities with rapidly growing populations numbering in the hundreds of thousands: the port of East London, the KwaZulu/Natal capital of Ulundi, the Free State capital of Bloemfontein, newer industrial centres such as Witbank in Mpumalanga, and a few rural service centres that have recently become regional administrative and educational centres and grown rapidly, such as Mafikeng, Nelspruit, and Pietersburg.

South African cities have shown a measure of racial segregation in residence since their colonial foundation. Segregated public housing areas were created in the early 20th century. Various measures introduced from the 1920s on gave authorities powers to segregate Africans and others; during the 1930s and '40s, attempts were made to extend such provisions to segregate Coloureds (persons classified as being of mixed race) and Indians from whites as well, culminating in the Group Areas Act of 1950. Under its provisions, South African cities acquired their characteristic form, with white residential areas, generally situated in more favourable localities, occupying most of the urban space. Other sectors and peripheral localities were set aside for those classified as nonwhites; many of those areas were initially devoted to segregated public housing estates called "townships." More recently a degree of racial integration of residence has occurred in some cities; for example, high-density residential areas such as Hillbrow in Johannesburg became effectively integrated despite the Group Areas Act. The act was repealed in 1991 but the racially defined settlement patterns in the towns and townships have persisted.

The people. *Ethnic distribution.* Government-determined racial and ethnic classification, embodied in the Population Registration Act in effect from 1950 to 1991, was crucial in determining the status of South Africans under apartheid. The act divided South Africans at birth into four racial categories—black, white, Coloured, and Asian—though these classifications were largely arbitrary, based on considerations such as family background and cultural acceptance as well as on appearance.

The original Khoikhoi and San peoples of South Africa scarcely exist as distinct groups inside the country today. Many intermarried with other African peoples who arrived before white conquest, and others intermarried with Malagasy and Southeast Asian slaves under white rule to form the backbone of the Coloured population. Bantu-speaking Africans entered the area roughly 1,800 years ago; their descendants today constitute about three-fourths of South Africa's population. The African population is heterogeneous, falling mainly into four linguistic categories. The largest is the Nguni, including various Ndebele-, Swati-, Xhosa-, and Zulu-speaking peoples, who constitute more than half the African population of the country and form the majority in many eastern and coastal regions as well as in the industrial Gauteng province. The second largest is Sotho-Tswana, which includes numerous Sotho-, Pedi-, and Tswana-speaking peoples and constitutes a majority in many Highveld areas. The other two are the Tsonga (or Shangaan) speakers, concentrated in Northern and Mpumalanga provinces, and the Venda speakers, located largely in Northern province.

Major African groups

White South Africans consist of two main language groups. More than half of them are Afrikaans speakers, the descendants of mostly Dutch, French, and German settlers. Most of the remainder are English-speaking, mainly the descendants of British colonists, with a sizable minority of Portuguese origin and smaller groups of Italians and others. Immigration from Europe exceeded 20,000 people per year during the late 1960s and early '70s, but in the late '70s and '80s the number of whites leaving South Africa tended to exceed the new arrivals. The white population is highly urbanized.

The population formerly classified as Coloured descended from Khoisan (Khoikhoi and San) peoples, slaves imported by the Dutch from Madagascar and what is now Malaysia and Indonesia, Europeans, and Bantu-speaking Africans. Several distinct subethnic groups can still be

Rural African settlement in the Nelspruit district of Mpumalanga province, northeastern South Africa, southwest of Kruger National Park.

Mark Segal/Tony Stone Worldwide

identified, such as the Malays, who largely originated from Indonesian Muslim slaves, and the Griquas, who trace their origins to a specific historical Khoikhoi community. While some Malays and Griquas have continued to identify themselves as Coloured, others who were so classified by the apartheid government have tried to reject the label entirely. Most of this population speaks Afrikaans or, to a lesser extent, English, and in many respects they cannot be distinguished culturally or physically from the white population. Those formerly classified as Coloured are concentrated in the western half of the country, particularly in Western Cape, Northern Cape, and the westernmost parts of Eastern province, where they form a majority in most districts.

South Africans of Indian descent, classified under apartheid as Asian, form a large minority, which originated with immigrant traders and indentured workers in the second half of the 19th century. Today the large majority live in KwaZulu/Natal and to a lesser extent in Gauteng, Northern, and Mpumalanga. Almost all Indian South Africans live in urban areas. Small communities of other ethnic Asians, including Chinese, live in some of the cities.

Religion. The largest category of religious affiliation is to independent African Christian churches. The largest established Christian denominations, drawing members from all ethnic groups, are the Methodist, Roman Catholic, Anglican, and Dutch Reformed churches. The other major religions are Hinduism, among the majority of Indians; Islām, among many Indians and Malays; and Judaism, among a significant minority of the white population.

(A.Ne./D.F.G./A.S.Ma./Ed.)

The economy. South Africa's economy was revolutionized in the late 19th century when diamonds and gold were discovered there. Extensive investment from foreign capital followed. In the years since World War II the country established a well-developed manufacturing base, and it experienced highly variable growth rates, including some years when its growth rate was among the highest in the world. From the late 1970s South Africa has had continuing economic problems, initially because its apartheid policies led many nations to withhold foreign investment and to impose increasingly severe sanctions against it. South Africa's economy did not immediately rebound in the early 1990s while apartheid was being dismantled, as investors waited to see what would happen. Only since democratic elections in 1994 has significant investment returned. Postapartheid South Africa now faces the problem of integrating the previously disenfranchised and oppressed majority into the economy. The government created a new plan in 1996 called Growth, Employment, and Redistribution (GEAR), focusing on privatization and removing exchange controls.

State participation

The economy is essentially based on private enterprise, but the state participates in many ways. Through the Industrial Development Corporation, the former government set up and controlled a wide array of public corporations, many relating to industrial infrastructure. The Iron and Steel Corporation (ISCOR), the major iron and steel producer, and the South African Coal, Oil, and Gas Corporation (SASOL), which produces oil from coal, were both privatized in the 1980s. The Electrical Supply Commission (ESKOM) remains government-controlled, but in the 1990s the government partially privatized airlines and telecommunications, and despite fierce opposition from trade unions, official economic policy has been to continue partially or completely privatizing many public enterprises.

By means of a range of official and quasi-governmental bodies, the government encourages industrial development, consultations on tariff protection, and export promotion and research; it also maintains a bureau of standards. The Development Bank of Southern Africa is a quasi-governmental company created to promote development projects, while the South African Housing Trust is a joint venture between the government and the private sector intended to provide low-cost housing.

Central government taxation consists primarily of income taxes on individuals and businesses and a value-added tax on transactions. Provincial governments depend mainly on transfer payments from the central government, while property taxes and levies on businesses provide the main support for local governments.

Historically, the stated policy of the African National Congress (ANC) was that it would seek a state-led mixed economy based on nationalized mining and financial enterprises, yet since taking leadership of the government in 1994 it has in fact pursued privatizing a substantial number of formerly state-owned enterprises. The government faces competing demands—to improve the living conditions of the impoverished black population while also addressing the demands for economic liberalization from business interests and Western governments. It has chosen to make maintaining business confidence and boosting investment the core element of its economic policy. (Ed.)

Resources. South Africa is rich in a variety of minerals. In addition to diamonds and gold, the country also contains reserves of iron ore, platinum, manganese, chromium, copper, uranium, silver, beryllium, and titanium. No commercially exploitable deposits of petroleum have been found, but natural gas in moderate quantities exists off the southern coast, and oil is made from coal at two large plants in the provinces of Free State and Mpumalanga.

Diamonds and gold

Large coal deposits exist, mostly at easily mined depths beneath the Mpumalanga and northern Free State Highveld. Vast deposits of platinum-group and chromium minerals are located mainly to the north of Pretoria. There are major deposits of iron ore and manganese, particularly in Northern Cape; titanium-bearing sands are common on the eastern seaboard.

Agriculture is of major importance to South Africa, especially as an employer, but land and water resources are generally poor. There are areas of exception, however, such as the well-watered, fertile soils of the Western Cape river valleys, the KwaZulu/Natal coast, and the Highveld of Mpumalanga and Free State, which offer good conditions for extensive cereal cultivation. There are also some dry areas in which irrigation allows the soils to become productive, such as in the Fish River valley of Eastern province. The Orange River Project is designed to add another three-tenths to the total land in production.

Timber resources are minimal, but the small percentage of land under indigenous forest has been supplemented by substantial areas under plantation in the wetter parts of the east and southeast. Hydroelectric potential is limited, though the government has developed projects on a number of rivers; more significant are the projects to import electricity from stations on the Zambezi at Cahora Bassa, Mozambique, and on rivers in the Lesotho Highlands.

Agriculture, forestry, and fishing. Arable land constitutes slightly more than one-tenth of the country's surface area, but in general agriculture contributes a substantial amount to both the domestic economy and exports. Among the major crops are corn (maize), wheat, sugarcane, sorghum, peanuts (groundnuts), citrus and other fruits, and tobacco. Sheep, goats, cattle, and pigs are raised for food and other products; wool and meat (beef, sheep, and goat) are important. Dairy (including butter and cheese) and egg production are also significant, particularly around the major urban centres.

Major agricultural products

The forest industry supplies mining timber, pulpwood for paper and board mills, and building timbers mostly sufficient for a construction industry that primarily uses brick, concrete, and steel. Fishing areas lie mainly off the western and southern coasts. The principal shoal-fishing products are pilchard and maasbanker, while offshore trawling produces kingklip, Agulha sole, Cape hake, and kabeljou, among others.

Industry. Although for decades manufacturing has employed more people and produced more output in terms of percentage of the GDP than has mining, the mining sector continues to form the core of the South African economy. Gold remains the most important mineral—South Africa is the largest producer in the world—and reserves are large; however, production is slowly declining, and prices have not ever equaled their spectacular highs of the early 1970s, rendering a number of older mines marginal or unprofitable. Several gold mines closed in the 1990s, and thousands of mine workers lost their jobs. The main

goldfields centred historically on Johannesburg; the major areas of production now lie some distance east, west (Far West Rand), and south (northern Free State) of Johannesburg, centred on towns such as Evander, Carletonville, and Welkom, respectively.

Coal is South Africa's second most valuable mineral product. The largest sales of coal are for export (to East Asia and Europe) and for the generation of electricity. Platinum and chromium, of which South Africa is the world's largest producer, are produced at centres such as Rustenburg and Steelpoort in the northeast and are becoming increasingly significant. Gem diamond production historically was concentrated around Kimberley but now occurs in a variety of localities. South Africa is among the world's largest diamond producers. Most South African diamond production is controlled by De Beers Consolidated Mines, Ltd.

Electricity is produced thermally almost entirely from coal. Most electric power is generated by ESKOM at huge stations in the Mpumalanga Highveld. Oil derived from coal supplies a percentage of the country's energy needs, the remainder coming from imports refined at the ports or piped to a major inland refinery at Sasolburg.

The major manufacturing sectors are in food processing, textiles, metals, and chemicals. Agriculture and fisheries provide the basis for substantial activity in meat, fish, and fruit canning, the sugar industry, and other processing; more than half the products are exported. A large and complex chemical industry developed from early beginnings in the manufacture of explosives for use in mining. A coal-based petrochemical industry produces a wide range of plastics, resins, and industrial chemicals. The metal industry, centred in Gauteng, draws much of its raw material from ISCOR, the iron and steel producer. Other firms also supply the steel, heavy engineering, and machinery industries. Imported materials supply aluminum manufacturers located mainly in KwaZulu/Natal. Manufacturing extends to automobiles, shipbuilding, building materials, electronics, and many other sectors, notably armaments, though the weapons industry has begun to diversify into nonmilitary production. Manufacturing has been highly dependent on foreign capital; it expanded rapidly in the 1960s and early '70s but grew relatively slowly or even contracted during the '80s. About one-fourth of manufacturing output is exported.

Finance. South Africa has a well-developed financial system. The South African Reserve Bank is the sole note-issuing authority. It formulates and implements monetary policy and manages foreign-exchange transactions. There are more than 50 registered banking institutions, about 15 of which concentrate on commercial banking. There are more than a dozen merchant and discount banks and a number of permanent building societies. The Land Bank is an important specialist state institution, lending to agriculture but historically only to white farmers.

Private pension and provident funds and more than 90 insurance companies play significant roles in the financial sector. There is an active capital market organized around the Johannesburg Stock Exchange.

Trade. Dependence on foreign trade is relatively high, and the South African economy is thus sensitive to global economic conditions. Precious metals and base metals have been leading exports; agricultural goods also play an important role. South Africa exports military equipment worldwide, particularly to the Middle East. The country's major imports are oil, machinery, electrical equipment, and transportation equipment. A number of imports, most importantly oil, have been classified by the government as "strategic materials." Data for these are not available, making it difficult to assess the exact percentages of various import categories. South Africa's main trading partners are the United States, the United Kingdom, Germany, Italy, and Japan. These five countries account for the bulk of the country's trade. However, South Africa's trading partners have diversified; Taiwan, several Latin-American countries, other African countries, and a number of Asian economies such as Singapore, Malaysia, and India account for an increasing proportion of South Africa's international trade. (E.I.U./D.F.G./A.S.Ma.)

Trading partners

Transportation. Because South African rivers are generally unsuitable for navigation, coastal shipping provides the only water transport. Africa's most intense network of roads and railways supplies most of the transportation demand.

The railway system is almost entirely owned and operated by the state; it serves all the major cities, most smaller towns, and many rural areas. A narrow gauge of 3 feet 6 inches (1,067 millimetres) was adopted in the 1870s to lower the cost of construction in mountainous terrain. More than three-fourths of the network of 14,000 miles of track is electrified, and over four-fifths of all traffic is hauled by electric locomotives. More than one-fourth of goods transported consists of coal, other minerals account for one-third, and agricultural products for one-eighth. Long-distance passenger services have declined, but many commuters use train services in all the major urban centres. The luxurious Blue Train—which runs the 1,000 miles between Pretoria, Johannesburg, and Cape Town—and the surviving steam-operated services provide popular tourist attractions.

The road network comprises some 120,000 miles of roads, ranging from rural unpaved stretches to multilane freeways. About 35,000 miles of road are paved. Most towns are connected by high-standard two-lane highways; freeway systems extend around the four major urban areas, but over long distances only Johannesburg and Durban are connected by four-lane highway. Almost all roads are provided and regulated by the different levels of government, but some long-distance roads have been transferred to the private sector, and tolls are charged on them.

Inland air transport services, both passenger and freight, are operated by state-owned South African Airways and by an increasing number of private competitors. Air services connect all major cities. South African Airways and many foreign carriers fly between South Africa and all neighbouring countries; international service extends to six continents. The international airport near Johannesburg is the main hub of South African air transport both domestically and internationally, while the airports at Cape Town and Durban play increasingly important roles as international destinations.

Air services

All South African ports are owned and operated by the government. Durban, which serves most of KwaZulu/Natal, Mpumalanga, and northern Free State, is the major port. Port Elizabeth, Cape Town, and East London handle mixed traffic for their immediate hinterlands and more distant locations. All these ports handle goods traveling to and from other African countries, including Zimbabwe, Zambia, and Zaire. Maputo, in Mozambique, which is the port closest to Johannesburg, serves many areas of the northern provinces. In addition, newer ports have been developed at Richard's Bay on the north coast of KwaZulu/Natal and in the excellent natural harbour at Saldanha Bay north of Cape Town, mainly for exports of coal and iron ore, respectively. (A.Ne./D.F.G./A.S.Ma.)

Administration and social conditions. The republic's original constitution, the South Africa Act of 1909, formed a parliamentary system with the British monarch as head of state. The constitution was revised by the Republic of South Africa Constitution Act of 1961, which transformed South Africa from a dominion within the Commonwealth to an independent republic. South Africa's political development has been shaped by the implementation of apartheid policies by the white minority, the ensuing widespread protest and social unrest, and the adoption in 1993 of a nonracial interim constitution that took effect in 1994. A new, permanent constitution, mandated by the interim document and drafted by Parliament, entered force in 1997.

Government under apartheid. Until 1994 the three officially designated nonwhite groups—Africans, Coloureds (those of mixed race), and Asians (primarily Indians)—were systematically deprived of political participation in the conduct of national and provincial affairs. With few exceptions, the nonwhite population was prohibited from voting. In 1959 African representation in Parliament, which had been provided by three elected whites, was abolished. The 1984 constitution extended the franchise

to Coloureds and Asians and established separate legislative chambers for whites, Coloureds, and Asians. Africans continued to be excluded from the national government.

The constitution. The constitution points to the injustices of South Africa's past in its preamble and defines the republic as a sovereign democratic state founded on the principles of human dignity, nonracialism and nonsexism, and the achievement of equality and advancement of human rights and freedoms. Another of its guiding principles, that of "cooperative government," emphasizes the distinctiveness, interdependence, and interrelationship of the national, provincial, and local spheres of government.

The constitution calls for a bicameral national Parliament. The lower house, or National Assembly, comprises 350 to 400 members who are directly elected to a five-year term through proportional representation. The National Council of Provinces, which replaced the Senate as the upper house, is made up of 10-member delegations (each with six permanent and four special members, including the provincial premier) chosen by each of the provincial assemblies. For most decisions each delegation casts a single vote. The president, elected from among the members of the National Assembly by that body, is the head of state and, as the head of the national executive, presides over a cabinet that includes a deputy president and a member whom the president designates as the "leader of government business" in the assembly. All citizens aged 18 years or older have the right to vote.

Provincial, regional, and local government. The South Africa Act of 1909 created a unitary state in which the four former colonies became provinces governed by a white-elected council. These provincial councils were abolished in 1986, and the executive committees, appointed by the president, became the executive arms of the state in each province. By the late 1980s a small number of Africans, Coloureds, and Indians had been appointed to them.

The constitution of 1996, which abolished the provinces in this form and replaced them with nine new provinces, provides for the election of provincial legislatures comprising 30 to 80 members, elected to five-year terms through proportional representation. Each legislature elects a premier, who then appoints a provincial executive council of up to 10 members. The provincial legislatures have the authority to legislate in a range of matters specified in the constitution, including education, environment, health, housing, police, and transport, although complex provisions give the central government a degree of concurrent power. South Africa thus has a weak federal system.

Urban municipal government has existed in South Africa since the early 19th century but has been unevenly developed. Local councils were elected by white voters only, with rare exceptions; Coloureds and Asians were allowed only advisory powers. In 1990 local government entered a phase of transition, and new arrangements came under negotiation. Under the 1996 constitution local government is predicated on the division of the entire country into municipalities. Executive and legislative authority is vested in municipal councils, some of which share authority with other municipalities. Chiefs (Zulu: amaKhosi; Sotho: Makgosi) were once the hereditary leaders of the various clans or tribes of African people in what is now South Africa. Under colonial rule, attempts were made to rule indirectly through chiefs, and under apartheid the chiefs were incorporated into the government, their appointments being dependent on the governing authorities. Chiefs generally work with traditional councils (known under apartheid as "tribal authorities").

Political parties. The all-white National Party (NP) was the dominant parliamentary party from 1948 to 1994. Before 1990 its programs emphasized white South African nationalism, anticommunism, and the implementation of apartheid. The largest black political organization has long been the African National Congress (ANC), formed in 1912 but banned 1960–90. The Inkatha Freedom Party (IFP, or Inkatha), founded in the mid-1970s, represented many Zulu people.

The ANC and the NP dominated the constitutional negotiations that began in 1990 and included about two dozen other groups. In the 1994 elections, the ANC took more than 60 percent of the vote, the NP about 20 percent, and Inkatha about 10 percent. The ANC won majorities in seven of the nine provinces; the NP in one, Western Cape; and Inkatha won a majority in KwaZulu/Natal. Racially defined voting patterns began to dissolve. The other parties receiving significant support were the Freedom Front (a right-wing white party), the Democratic Party (the heir to a long liberal tradition in white politics), and the Pan-Africanist Congress, a small group that broke away from the ANC in 1959. The South African Communist Party, the South African National Civic Organization, and the trade union federation entered candidates on the ANC's lists.

Provinces of South Africa.

Justice. The common law of the republic is based on Roman-Dutch law, the uncodified law of the Netherlands retained after the Cape's cession to the United Kingdom in 1814. The judiciary comprises the Constitutional Court (with powers to decide on the constitutionality of legislative and administrative actions, particularly with respect to the bill of rights), the Supreme Court of Appeal (the highest court of appeal except in constitutional matters), the High Courts, and Magistrate's Courts. The Supreme Court is headed by a chief justice, who is appointed by the state president, as are the deputy chief justice and the chief justice and deputy chief justice of the Constitutional Court. Other judges are appointed by the president with the advisement of the Judicial Service Commission. Traditional authorities exercise some powers in relation to customary law, which derives from indigenous African practice codified in some areas (such as KwaZulu/Natal) by colonial rulers. Customary law continues to be recognized in various ways. Most civil and criminal litigation is a matter for the Magistrate's Courts.

Armed forces and security. In 1994 the armed forces entered a period of transition. South Africa's military traditionally had been white, with a small standing force and a large reserve component. However, from the 1970s an increasing number of black troops were recruited. Compulsory military service, formerly for white males only, ended in 1994. Integration of forces established as part of the antiapartheid struggle brought change to the military as the guerrillas of the ANC's military wing, Umkhonto we Sizwe ("Spear of the Nation"), were incorporated into the South African army.

Integration of the military

The navy has a small fleet consisting of frigates, submarines, minesweepers, small strike craft, and auxiliary vessels. The air force's craft include fighter bombers, interceptor fighters, helicopters, and reconnaissance, transport, and training aircraft. (M.J.L./D.F.G./A.S.Ma./Ed.)

During the apartheid period the South African government, through a network of private and government-

controlled corporations led by the state-owned Armaments Corporation of South Africa (Armscor), developed a variety of new weapons systems, mostly in order to overcome the effects of the international arms embargo imposed by the United Nations Security Council in 1977. Nuclear weapons were developed in great secrecy—six atomic bombs were built during the 1970s and '80s—but the nuclear weapons program was terminated in 1989, and the bombs were dismantled the following year.

The regular police are organized nationally and comprise regulars as well as reservists. There have been about equal numbers of whites and nonwhites. The police bear the responsibility of maintaining internal security; this brought them into sharp conflict with antiapartheid demonstrators during the 1970s and '80s. Freed of the burden of enforcing apartheid, the police face the challenge of forging better relationships with communities in the fight against rising crime levels.

In the late 1970s the daily average prison population was almost 100,000, one of the highest rates in the world. Of these the majority were imprisonments for statutory offenses against the so-called pass laws, repealed in 1986, which restricted the right of Africans to live and work in white areas and which did not apply to other racial groups. Since then the proportion of the population in prison has declined, as the ending of the state of emergency in 1990 and the process of negotiating a new constitution led to the release of many political prisoners. An amnesty policy was instituted, covering politically inspired offenses committed on both sides during the closing years of the struggle against apartheid.

Education. Under apartheid, different departments of education—segregated by racial category—ran school systems that varied greatly in standards and facilities. Schools run by white education departments had the best resources in the public school system. From 1990 some of these schools began to admit black pupils according to a variety of limited models of change. Since the 1993 constitution outlaws discrimination on grounds of race, schools are now compelled to admit all applicants, but capacity limitations and fees generally have kept Africans out of historically white public schools. Private schools, many of which offer superior educational programs, remain largely inaccessible to Africans because of the high cost.

Educational reform

The great challenge facing the provincial departments of education is to repair the decimated system of African education inherited from the apartheid years. The majority of pupils are in schools formerly run by the old "homeland" governments; these schools were characterized by poorly trained teachers, a corrupt and mismanaged bureaucracy, and a chaotic learning environment. Some schools became centres of protest and rebellion, and students were often absent for long periods because of boycotts. Many African schools were severely overcrowded and lacked basic structural necessities such as indoor plumbing, heat, and electricity; educational materials including textbooks, paper, and desks were in short supply. In 1993 a National Education and Training Forum, comprising representatives of the government and private sector, educators, parents, and students, was established to address the education crisis and develop a comprehensive reform program. School education is compulsory for all children between 7 and 16 years of age.

Higher education

The oldest and largest of the universities is the University of South Africa, which began in Cape Town but is now based in Pretoria and which offers correspondence courses in both English and Afrikaans. The oldest of the residential universities are those of Cape Town, Fort Hare, Stellenbosch, and Witwatersrand (Johannesburg); of these, only Stellenbosch is an Afrikaans-language institution, while Fort Hare was originally established to serve Africans only. Newer Afrikaans institutions are the Universities of Pretoria and Potchefstroom and Rand Afrikaans University (Johannesburg), while the University of Port Elizabeth is bilingual. The English-language institutions, including the University of Natal (Pietermaritzburg and Durban) and Rhodes University, to some extent admitted black students prior to 1959, when their ability to do so was undermined by apartheid legislation that they fiercely opposed. The government then established several new institutions (the Universities of the North, Zululand, Western Cape, Durban-Westville, and Vista and the Medical University) for various black groups. The former homelands of Bophuthatswana, Transkei, and Venda also established their own universities. In 1983 official university apartheid ended, but the various institutions remain influenced by their historically dominant ethnic character. Professional and postgraduate courses are concentrated at the formerly white universities. Technically oriented education is offered by a range of *technikons* and technical colleges.

Health and welfare. While racial bias was not explicitly written into health legislation during the apartheid period, health care for South Africans invariably reflected the economic and political inequalities of the society. Hospital segregation has ended, but access to health services remains greatly inferior in historically black areas. The health status of Africans is generally low; malnutrition is perhaps the most important example, especially among rural children. There is an enormous discrepancy in infant mortality rates, which are lowest for whites and highest among rural Africans. The number of South Africans infected with HIV, the virus that causes AIDS, increased sharply during the 1990s. Since 1994 both the Department of National Health and the administrations of the new provinces have emphasized primary health care delivery, building in some instances on programs that farsighted medical workers instituted during the apartheid period.

In the cities and large towns a highly sophisticated public health system exists. Some of the largest public hospitals are linked to the university medical schools, but those located in the formerly segregated African areas tend to be overcrowded. Many of the more expensive private hospitals are accessible only to those of higher incomes. Most regularly employed persons enjoy a degree of private medical insurance; for many of the more affluent, private general practitioners and specialists supply most needs. National policy development in the postapartheid period may include some form of national health insurance, at least for poorer people.

Government provides a number of welfare measures, among them small pensions for all citizens beyond retirement age whose incomes are below a minimal level. Large numbers of elderly Africans, and often their dependents, gain a minimal livelihood from this system. In the past, welfare systems were administered separately for different defined racial groups; the value of pensions was greatest for whites, less for Indians and Coloureds, and lowest for Africans. During the late 1980s the differentials began to be reduced, and the 1993 constitution prohibits discrimination on grounds of race.

Local authorities have been responsible for public housing since the 1920s; it has been segregated by race, and control over African housing reverted to the central government in 1971. Much of the housing built for Coloureds and Indians was used to rehouse communities moved from one area to another under the Group Areas Act of 1950, contributing to a housing shortage. A massive program of township development in African areas began in the 1950s but diminished in the 1970s, also contributing to the housing problem. During the 1980s, "site-and-service" schemes emerged to provide land for poorer, usually black people around the cities, but the housing crisis remained severe. In the 1990s, housing policy emphasized the joint roles of the public and private sectors; the government launched an ambitious program of capital subsidies and loan guarantees in an effort to upgrade housing conditions and assist all citizens to acquire title to some form of shelter.

The most important features of social conditions are the high level of unemployment and the wide disparities in wages, both of which redound to the disadvantage of black South Africans. In the mid-1990s more than one-quarter of the African population was unemployed, and those who were employed were generally in the lowest-paying and least prestigious positions. This pattern partially reflects the composition of South Africa's population, with its many migrants to industrial and urban areas. Substantial wage advances in the mining and industrial sectors of

the economy since the 1970s have not been shared by the nonunionized and the unemployed. However, access to government employment, the professions, and business has grown rapidly for Africans, Indians, and those of mixed race, and there are signs of significant change in the distribution of employment in South Africa in the 1990s as more midlevel positions are held by nonwhites.

(M.J.L./D.F.G./A.S.Ma.)

Cultural life. Eleven languages (Afrikaans, English, Ndebele, North Sotho, South Sotho, Swazi [Swati], Tsonga, Tswana, Venda, Xhosa, and Zulu) hold official status under the 1993 constitution, and a further 11 (Arabic, German, Greek, Gujarātī, Hebrew, Hindī, Portuguese, Sanskrit, Tamil, Telugu, and Urdū) are to be promoted and developed. All South African languages are spoken to varying degrees in different regions; there are some areas where most residents speak neither Afrikaans nor English, but those two languages allow communication in most parts of the country. Early school education is available in all the official languages. English appears to predominate to an increasing extent in official, educational, and formal business spheres.

The arts. The many languages spoken by South Africa's people reflect the country's cultural diversity. The Africans have adopted a host of Western ways, but a core of African cultural traditions of language, music, and dance retains its vitality and has contributed to a distinctly South African fusion of cultural forms. Some of the better-known features of that fusion appear in the music of jazz, religious, and popular groups such as the African Jazz Pioneers, Ladysmith Black Mambazo, and others. The various African societies have rich oral traditions, including narrative, poetic, historical, and epic forms. These oral traditions, while they remain strong in their own right, especially in rural parts of the country, have exerted a major influence on the written literatures of the African cultures, which also have been influenced by literary traditions of other parts of Africa, of the Caribbean and the Americas, and of Europe.

Oral traditions

Such writers as Guybon Sinxo (Xhosa), B.W. Vilakazi (Zulu), Oliver Kgadime Matsepe (North Sotho), and Thomas Mofolo (South Sotho) have been more heavily influenced in their written work by the oral traditions of their cultures than by European forms. Works composed in the indigenous languages have been largely ignored or dismissed as works written for the schools or as works with limited audiences, yet these novels and poems have for years been a primary means of expression for African intellectuals. No matter the size and composition of the audiences, the works are a significant part of the intellectual history of South Africa.

During the 1970s there emerged in the arts powerful themes of national and multiracial, multilingual cultural patterns, as writers and artists from all backgrounds concentrated on exploring and portraying the turmoil affecting South African society. Reaction to apartheid engendered a sense of black culture and history that both anticipated and drew upon Negritude as it was manifested in West African, Caribbean, and American movements. The themes of Black Consciousness evident in the poetry and prose of urban writers such as Mothobi Mutloatse and Miriam Tlali and published in such periodicals as *Staffrider* are derived from the literary and oral traditions of African languages in South Africa and in literature by Africans in European languages.

For many decades works with strong political themes or explicit sexual scenes were banned. A large segment of Afrikaner writers became alienated from the government; authors such as Breyten Breytenbach, Dan Roodt, André Brink, and Étienne Leroux had their works banned.

The authors Adam Small and Alex La Guma have written vividly in Afrikaans and English, respectively, of the effects of racial discrimination and of the complex and frequently violent nature of life in South Africa. Many black and white writers addressing these and other themes have received international recognition. Newly recognized writers such as J.M. Coetzee, Sipho Sepamla, and Mongane Wally Serote have joined such established figures as Es'kia (Ezekiel) Mphahlele, Alan Paton, Brink, and Leroux in bringing South African literary life to the wider world. In 1991 Nadine Gordimer, a short-story writer and novelist, was awarded the Nobel Prize for Literature.

Literature

South African playwrights responded to the new cultural and political milieu with such innovations as multilingual plays. Support for the newer indigenous theatre came from independent and nonracial theatrical organizations, such as the Market Theatre in Johannesburg. Plays by Athol Fugard, Mbongeni Ngema, Fatima Dike, and Pieter-Dirk Uys have been performed worldwide.

The major institutional support for culture during the apartheid years came from the provincial councils for the performing arts. These councils helped fund plays, operas, ballets, symphonies, and other cultural events. The postapartheid period brought change in such institutional matters, though under the 1993 constitution the new provinces retained control over cultural affairs.

The press and broadcasting. The press in contemporary South Africa, which has a long tradition of free expression, found itself under increasing political and legal constraints from the 1960s onward. Historically, the strongest elements of the press have been distinct English- and Afrikaans-language publishers. African readership has expanded greatly, though some papers aimed at that market, such as *The World,* were banned during previous decades. Individual journalists were banned, detained, and threatened. During the 1980s a new independent press emerged, represented by newspapers such as *New Nation* and *Weekly Mail. Vrye Weekblad,* the first Afrikaans-language antiapartheid newspaper, closed in 1994. With South Africa's reemergence in the world economy, foreign media interests began to take a greater interest in the local market; the largest daily newspaper group in the country was taken over by an international concern.

Television—introduced in the mid-1970s—and radio constitute important forces in South African society. Until the lifting of emergency media restrictions in February 1990, the government tightly controlled both mediums, which air programs for the different linguistic and cultural groups in the country. The government used television and radio to communicate its own views and to counter cultural tendencies that it perceived to be threatening to the implementation of apartheid. Most electronic media remain publicly owned, but the pattern of management and public participation in their control changed decisively after 1994 as the previously white- and male-dominated management changed to a more representative mix under the new government.

(R.V./D.F.G./A.S.Ma.)

For statistical data on the land and people of South Africa, see the *Britannica World Data* section in the BRITANNICA BOOK OF THE YEAR.

HISTORY

The prehistory and history of South Africa span nearly the entire known existence of humans and their ancestors—some three million years or more—and include the wandering of small bands of hominids through the savanna, the inception of herding and farming as ways of life, and the construction of large urban centres. Through this diversity of human experience, several trends can be identified: technological and economic change, shifting systems of belief, and, in the earlier phases of humanity, the interplay between physical evolution and learned behaviour, or culture. Over much of this human career, South Africa's past is also the past of a far wider area, and it is only in the past few centuries that this southernmost country of Africa has had a history of its own.

Prehistory. The earliest creatures that can be identified as direct ancestors of modern humans are classified as australopithecines (literally, "southern apes"), of which the first specimen to be described (in 1925) was the skull of a child from a quarry site at Taung (now in Northern Cape province). Subsequently, more australopithecine bones have been found preserved in limestone caves in the Transvaal region, where they had originally been deposited, up to three million years ago, by predators and scavengers. Australopithecines walked upright, fashioned simple tools from stone and bone, and lived by gathering plant foods and scavenging for meat.

Australopithecine sites

In common with that of other parts of the world, South Africa's prehistory has been divided into a series of phases based on broad patterns of technology. The primary distinction is between a reliance on chipped and flaked stone implements (the Stone Age) and the ability to work iron (the Iron Age). The Stone Age, which in itself spans almost all human history, is further divided into early, middle, and late stages. The simple stone tools found with australopithecine fossil bones fall into the earliest part of the Early Stone Age.

The Early Stone Age. Early humans were evolving both in their physical form, gaining greater dexterity and mental ability, and in their cultural adaptations to the world. In recognition of the physical changes that were taking place, the fossil bones are divided into different genera and species. The genus *Homo* developed from and evolved alongside the genus *Australopithecus* before superseding the more archaic form. Early species of *Homo* also made stone tools that belong to the Early Stone Age; most Early Stone Age sites in South Africa were probably left by people classified as *Homo erectus*.

Simply modified stones, hand axes, scraping tools, and other bifacial artifacts were used for a wide variety of purposes, including butchering animal carcasses, scraping hides, and digging for plant foods. Most Early Stone Age archaeological sites in South Africa are the remains of open camps, often by the sides of rivers and lakes, although people also lived in rock shelters, such as Montagu Cave in the Cape.

The Early Stone Age was a period of very slow change: for more than a million years and over a wide geographic area, there were only the slightest differences in the forms of stone tools. However, the slow alterations in physical appearance that took place over the same time period are sufficient for physical anthropologists to recognize new species in the genus *Homo*. By about 500,000 years ago, some people were sufficiently modern in appearance to be considered an archaic form of *Homo sapiens:* important specimens belonging to this physical type have been found at Hopefield in Western Cape and at the Cave of Hearths in Mpumalanga.

The Middle Stone Age. Sometime after 200,000 years ago this long episode of slow cultural and physical evolution gave way to a period of more rapid change. Hand axes and big bifacial stone tools were no longer made, and people began to use stone flakes and blades to fashion scrapers, spear points, and parts for hafted, composite implements—a technological stage that has become known as the Middle Stone Age.

Change to flaked tools

There are numerous Middle Stone Age sites in South Africa. People continued to live in open camps, while rock overhangs also were used for shelter. Day-to-day debris has survived to provide some evidence of early ways of life, although plant foods, which must have been important, are rarely preserved. Middle Stone Age bands hunted medium-size and large prey such as antelope and zebra, although they tended to avoid the largest and most dangerous animals such as the elephant and rhinoceros. Sometimes they collected tortoises and ostrich eggs in large quantities, as well as seabirds and marine mammals that could be found along the shore. The rich archaeological deposits of Klasies River Mouth Cave, on the Cape coast west of Port Elizabeth, preserve the earliest evidence in the world for the use of shellfish as a food source.

Klasies River Mouth Cave also is important for the evidence it provides for the emergence of anatomically modern humans. Some of the human skeletons from the lower levels of this site, possibly as old as 115,000 years, are modern in form. Equally early fossils have been excavated at Border Cave, in the mountainous region between KwaZulu/Natal and Swaziland. This archaeological evidence is consistent with the results of research by geneticists, some of whom believe that there was a single ancestral population of modern humans living in Africa about 200,000 years ago.

The Late Stone Age. About 40,000 years ago people again began to change their basic techniques of toolmaking. Small, finely worked stone implements known as microliths began to become common, and the heavier scrapers and points of the Middle Stone Age less frequent. Archaeologists refer to this new technological stage as the Late Stone Age. The new ways of working stone again reflect an accelerating pace of change. In contrast to the almost static millennia of the Early Stone Age and the slow cultural changes of the Middle Stone Age, Late Stone Age people were far more responsive to changes in their environment. The numerous collections of stone tools from South African archaeological sites dating to the past 40,000 years show, in consequence, a great degree of variation through time and across the subcontinent.

Like their predecessors, Late Stone Age people relied heavily on plant foods, the remains of which have been well preserved at sites in the Cape region. Animals were trapped and hunted with spears and arrows on which were mounted fine stone blades. In many areas people moved with the seasons, following game into higher lands in the spring and early summer months, when new flushes of plant foods could also be found. When available, rock overhangs were occupied; otherwise, windbreaks were used for shelter. Coastal resources were important, resulting in numerous shell middens scattered along the full length of the South African coastline. Shellfish, crayfish, seals, and seabirds were collected or caught along the shore, and fish were caught on lines, with spears, in traps, and possibly with nets.

Belief systems

Late Stone Age communities are the first to have left evidence for complex systems of belief, probably because sophisticated symbolic abilities are uniquely part of the anatomically modern condition—earlier forms of humans probably did not think in this way. There are numerous engravings on rock surfaces, mostly on the interior plateau, and paintings on the walls of rock shelters in the mountainous regions of South Africa, such as the Drakensberg and Cedarberg ranges. Dating is difficult, but it is clear that the art spans at least the past 25,000 years. South African rock art was originally seen either as the work of exotic foreigners such as Minoans or Phoenicians or as the product of primitive minds. Now it is widely accepted that the paintings were closely associated with the work of medicine people: shamans who were involved in the well-being of the band and often worked in a state of trance. Specific representations include trance dances, metaphors for trance such as death and flight, rainmaking, and control of the movement of antelope herds.

Pastoralism and early agriculture. About 2,000 years ago, new ways of living came to South Africa. From their earliest years, human communities had lived by gathering plant foods and by hunting, trapping, and scavenging for meat. However, people began to make use of domesticated animals and plants. In the east, where rainfall is adequate, crops could be grown and cattle, sheep, and goats herded near permanent villages and towns. In the west, where the climate is arid or where rain falls at the wrong times of the year for African cultivated plants, domestic livestock were kept by nomadic pastoralists, who moved over wide territories with their flocks and herds.

Early nomadic pastoralism

The origin of nomadic pastoralism in South Africa is still obscure. Linguistic evidence points to northern Botswana as a centre of origin, and this is supported by sheep bones, found in the same archaeological levels as pottery, that have been dated to about 150 BC from Bambata Cave in southwestern Zimbabwe. It is still unclear whether new communities moved into South Africa with their flocks and herds or whether established hunter-gatherer bands took up completely new ways of living. However, the results of archaeological excavations have shown that by the first few centuries AD sheep were being herded fairly extensively in Eastern and Western Cape provinces and probably in Northern Cape as well.

Surviving traces of sites where herders lived tend to be elusive. One of the best-preserved camps is at Kasteelberg, on the southwest coast near St. Helena Bay, where pastoralists kept sheep, hunted seals and other wild animals, and gathered shellfish, repeatedly returning to the same site for some 1,500 years. Such communities were directly ancestral to the Khoikhoi herders who encountered European settlers at the Cape of Good Hope in the mid-17th century.

The archaeological traces of farmers in the eastern regions of South Africa are more substantial. The earliest sites date to the 3rd century AD, although it is probable that farmers were already well established by this time. Scatters of potsherds with distinctive incised decoration mark early village locations in Mpumalanga and parts of KwaZulu/Natal.

The Iron Age. These first farmers had knowledge of ironworking, and their archaeological sites are grouped together as the Iron Age. The Early Iron Age represents the arrival in South Africa of new groups of people, having strong connections with East Africa and directly ancestral to the Bantu-speaking communities who form the majority of South Africa's population today.

Early Iron Age farmers grew crops, cutting back the vegetation with iron hoes and axes, and herded cattle and sheep. They also relied heavily on gathering wild plant foods, some hunting, and collecting shellfish if they lived near enough to the coast. Where conditions for agriculture were favourable (such as in the Tugela [Thukela] River valley in KwaZulu/Natal), villages grew to house several hundred people. There was probably some trade between different groups of farmers—evidence for specialization in salt making has been found in Mpumalanga—and with the hunter-gatherer bands that continued to occupy most parts of South Africa. Finely made, life-size ceramic heads from Lydenburg in Mpumalanga, dated to the 7th century AD, are a shadow of the complex systems of belief that have largely been lost to history.

Early Iron Age villages were built in low-lying areas, such as river valleys and the coastal plain, where forests and savannas allowed slash-and-burn agriculture. However, from the 11th century, farming communities began to settle the higher-lying grasslands beneath the Drakensberg and on the interior plateau. In many areas they started making different forms of pottery as well as villages built of stone. It is probable that these and other changes in patterns of behaviour reflect the increasing importance of cattle in both economic and social life. By convention, this later phase of precolonial farming is known as the Late Iron Age.

Other changes came in the north. Arab traders had begun to establish small settlements on the Tanzanian and Mozambican coasts in their search for ivory, animal skins, and other exotica. The trade beads they offered in return began to reach villages in the interior, the first indications that the more complex economic and social structures associated with long-distance trade were developing. The arid Limpopo River valley, eschewed by the earliest farmers, became a focal point of settlement as a natural trade route. Sites such as Pont Drift (about AD 800 to 1100) and Schroda (dated to the 9th century) show that their occupants were rich in both livestock and trade beads.

Mapungubwe

This was the setting in which Mapungubwe developed as South Africa's first urban centre. Starting as a large village like Schroda and Pont Drift, Mapungubwe rapidly developed into a town of perhaps 10,000 people. Differences in status were marked out clearly: the elite lived, and were buried, on the top of the stark sandstone hill that is at the centre of the town, while ordinary people lived in the valley below. The hilltop graves contained lavish burial goods, including a carefully crafted gold rhinoceros, and excavations have provided evidence for specialized crafts such as bone and ivory working, all suggestive of social and economic differentiation. Mapungubwe was abandoned sometime in the 12th century, after having been occupied for perhaps 200 years. It is likely that both the town's founding and its decline were closely related to trade—to the possibilities that the connection with the coast along the Limpopo valley offered for the accumulation of wealth and to the capture of this trade by Great Zimbabwe, farther to the north.

Europeans had long envied the riches of the Arab world, and in 1488 the first Portuguese ships rounded the Cape of Good Hope, pursuing a share of the lucrative Arab trade with the East. Over the following century, numerous vessels made their way off the South African coast, but the only direct contacts came with the bands of shipwreck survivors who either set up camp in the hope of rescue or tried to make their way northward to Portuguese settlements in Mozambique. From the early 17th century, the Portuguese control of the Cape sea route was challenged by both the British and the Dutch. In 1615 the British founded a short-lived settlement at Table Bay, and in 1652 the Dutch East India Company set up a small garrison under the slopes of Table Mountain, charged with the task of provisioning the Dutch fleets.

Settlement of the Cape Colony. The Dutch East India Company, always mindful of unnecessary expense, did not intend more than a minimal presence in the southernmost part of Africa. However, farming beyond the shores of Table Bay proved necessary, and in 1657 nine men were released from their contracts with the company and granted land along the Liesbeek River. In the same year, the first slaves were brought to the Cape, and, by the end of the century, the stamp of Dutch colonialism in South Africa was clear. Settlers, aided by increasing numbers of slaves, grew wheat, tended vineyards, and grazed their sheep and cattle from the Cape peninsula to the Hottentots Holland Mountains, some 30 miles away. A census of 1707 listed 1,779 settlers, owning 1,107 slaves.

In the initial years of Dutch settlement at the Cape, Khoikhoi pastoralists were keen to trade. However, the garrison's demand for cattle and sheep seemed insatiable, and the Khoikhoi became more wary. The Dutch began to push farther into the interior, seeking livestock in return for tobacco, alcohol, and trinkets. Numerous conflicts followed, and many Khoikhoi communities were decimated by smallpox, particularly in 1713. At the same time, colonial pastoralists, or trekboers, began to move inland beyond the Hottentots Holland Mountains with their own herds. By the end of the 18th century, the Khoikhoi chiefdoms had been largely decimated, their people either dead or reduced to conditions close to serfdom on colonial farms. The San (or Bushmen)—small bands of hunter-gatherers who had hung on to old ways of life in isolated areas—fared no better. Pushed back into marginal areas, they were forced to live by cattle raiding, justifying in colonial eyes their systematic eradication. Men were slaughtered and women and children taken into servitude.

Expansion into the interior

Trekboers were in constant search of new pasturage, and they and their families spread northeast as well as north, moving toward the grasslands long occupied by Late Iron Age farmers. For many generations these communities had lived in settlements concentrated along the low ridges of the interior plateau. Population estimates are difficult, but some of these larger villages must certainly have housed several hundred people. Cattle were kraaled (penned) in elaborately built stone enclosures, the ruins of which survive today across a large part of Free State and in the higher areas of the Transvaal region. Extensive networks of exchange brought iron for hoes and spears from specialized manufacturing centres in the Mpumalanga Lowveld and the deep river gorges of KwaZulu/Natal.

Thus, by the closing decades of the 18th century, South Africa fell into two broad regions. The west—including the winter rainfall region around the Cape of Good Hope, the coastal hinterland northward toward the Namibian border, and the dry lands of the interior—was dominated by the advancing frontier of colonial settlement. Trekboers were taking increasingly more land from the Khoikhoi and from remnant hunter-gatherer communities, who were killed, were forced into marginal areas, or became labourers tied to the farms of their new overlords. In the east—where summer rainfall and good grazing made mixed farming economies possible—Late Iron Age farmers had long been established in both coastal and valley lowlands and on the Highveld of the interior.

Growth of Cape Town

Meanwhile, Cape Town had been developing as South Africa's second urban centre, although it was many years before it reached the size of Mapungubwe some five centuries earlier. The administration of town and colony was in the hands of a governor and council, and the economy was in principle directed by the economic interests of the Dutch East India Company; in practice corruption and illegal trading were the order of the day. Both town and colony depended for their existence on the slaves, who by now outnumbered their owners. (M.Hl.)

Growth of the colonial economy. During the century from about 1770 to about 1870, the region now known as South Africa was integrated more fully into the world capitalist economy. The decisive moment was the seizure of the Cape Colony by Britain in 1806 as a strategic base (securing the developing empire in India), market, source of raw materials, and outlet for surplus people. Britain possessed world hegemony between the 1810s and '60s, and its shadow loomed over southern Africa.

By the 1860s the Cape Colony had spawned the subcolonies of Natal, the Orange Free State, and the Transvaal. Whites settled to the edges of the Kalahari desert in the west, the Drakensberg and Natal coast in the east, and the tsetse-fly- and mosquito-ridden Lowveld along the Limpopo River valley in the northeast. Africans were dispossessed of much of their land, and many of them were forced to work for the settlers. The settler population increased from about 20,000 in the 1780s to about 300,000 in the late 1860s. It is impossible to estimate the African population accurately, but it is likely to have been between 2,000,000 and 4,000,000.

Evolution of the African states

After the 1760s African societies were increasingly affected by ivory and slave traders operating from Delagoa Bay, Inhambane, and the lower Zambezi (in modern Mozambique) as well as by traders and raiders based in the Cape to the south. In response to these invasions, surviving African farming peoples evolved a number of sister states different in structure, scale, and military capacity from anything that had gone before. The most successful were the Pedi and Swazi in the eastern Highveld, the Zulu south of the Pongola River, the Sotho in the Caledon valley, the Gaza along the lower Limpopo, and the Ndebele in southwestern Zimbabwe. Possessing agriculture, these African societies proved resilient, unlike the hunting societies in the Cape, the Americas, and Australia. But unlike, for instance, states in China, they were unable to repel the invaders altogether, possibly because food surpluses had been insufficient to support a military class able to force unification early enough. Nor, even at their height in the 1860s, were the African states able to unite. They were able to protect their peoples from proletarianization and impoverishment for only a brief period. Accentuated competition among the European nations and the discovery of gold and diamonds in the 1860s led to a new imperialist offensive: between the 1870s and '90s the African states were destroyed by Europeans exploiting African divisions and using new breech-loading rifles and the first machine guns.

After the 1770s the Dutch settlers and African farming peoples collided. Dutch trekboers advanced across the semidesert Karoo of the central Cape and met agricultural peoples along a line running from the lower Vaal and middle Orange river valleys to the sea around the Gamtoos River (west of Port Elizabeth). West of this line the nonagricultural Khoi groups had already been badly disrupted by European invaders. The Boers were weakly controlled by the Dutch East India Company, a mercantilist organization that monopolized a sparse trade and was unenthusiastic about colonization. Rebellions against the company—as, for instance, by the burghers of Swellendam and of Graaff-Reinet in 1795—became frequent. In the 1780s armed clashes over land and cattle began between the Boers and Xhosa groups such as the Gqunukhwebe and Ndlambe in the Zuurveld between the Sundays and Fish rivers. The Boers developed a commando system in these continuous forays.

In contrast to this eastern frontier, the longer-settled areas of the western Cape had evolved a less fluid agricultural economy of grape and wheat farms run by imported slave labour. Slaves were treated harshly, and punishments for assaulting whites were brutal—for instance, death by impalement. Escaped slaves formed Maroons—small, self-sufficient communities—or fled into the interior. Because slave birth rates were low and settler numbers were increasing, the Dutch in the 1780s stepped up the enserfment of surviving Khoi (pejoratively called "Hottentots") to help run the farms. Many Khoi in the east joined Xhosa groups in a major counteroffensive against colonialism in 1799–1801, and there were slave rebellions in 1808 and 1825.

The Dutch refusal to grant citizenship rights (*e.g.*, access to land) to "Coloured" offspring of unions between whites and Khoi or slaves produced aggrieved "Bastard" groups that were Christian, spoke Dutch, and had an excellent knowledge of horses and firearms. Many fled north toward and over the Orange River in search of land and trading opportunities. After merging with independent Khoi groups, such as the Kora, they formed commando states under warlords, the more successful of whom came from the Bloem, Kok, Barends, and Afrikaner families. By the 1790s they were trading with and raiding local African communities such as the Rolong, Tlhaping, Hurutshe, and, farthest north, Ngwaketse. These groups coalesced into larger aggregations of people, who competed with each other to control trade routes going south to the Cape and east to Mozambique. By about 1810 Moleabangwe of the Tlhaping and Makaba of the Ngwaketse, for example, were already powerful rulers.

European trade on the eastern coast

Along the southeast coast the Portuguese and some British and French were trading beads, brass, cloth, alcohol, and firearms in return for ivory, slaves, cattle, gold, and minor items such as wax and skins. During the late 18th century, high volumes of ivory were exported from Delagoa Bay annually, and slaves were taken from the Komati and Maputo river regions and sent to the Mascarene Islands in the Indian Ocean and to Brazil. There they worked sugarcane, coffee, and other plantations that met the needs of Europe's rising population. By 1800 trade routes linked Delagoa Bay northwest to the Soutpansberg (where copper was obtained from the Venda), west to the Tlhaping and Hurutshe, and south to the Zuurveld—thereby linking the Cape and coastal trade routes with the central interior.

This European trade was a primary cause of structural transformation within societies inland of Delagoa Bay. Warlords reorganized military institutions to hunt elephants and slaves. Profits from trade enhanced patronage capabilities, attracted followers, and raised military potential and, in turn, the capacity to dominate land, people, and cattle. Near the bay, Tembe and Maputo were already powerful states by the 1790s. To the west emerged the Maroteng of Thulare, the Dlamini of Ndvungunye, and the Hlubi of Bhungane. Between the Pongola and Tugela rivers evolved the Mthethwa of Dingiswayo south of Lake St. Lucia, the Ndwandwe of Zwide, the Qwabe of Phakatwayo, the Chunu of Macingwane, and, south of the Tugela, the Cele and Thuli. These groups competed to dominate trade and were the more militarized the closer they were to the Portuguese base.

Accentuated European impact, *c.* 1810–35. *British occupation of the Cape.* In 1795 the British responded to France's overrunning the Dutch Republic by occupying the Cape. After returning it at the Treaty of Amiens in 1802, they reannexed the colony in 1806 after the beginning of the Napoleonic Wars. Prior to the opening of the Suez Canal in 1869, the Cape became a vital base for Britain—the Cape economy was meshed with Britain's. London Missionary Society and Methodist missionaries, as well as hunters and traders, ranged into Transorangia (the territory in the interior to the north and south of the Orange River) and the Transkei, mapping and exploring. Until 1825 Cape wines were given preferential access to the British market. Merino sheep were introduced, and serious sheep farming was begun to supply wool to British textile mills.

The infrastructure of a new type of colony was established. English replaced Dutch as the language of administration; in 1825 the Dutch rix-dollar was replaced by sterling; newspapers opened in Cape Town after 1824; British colonial governors were brought out; and in 1825 an advisory council for the governor was established, which was upgraded into a legislative council in 1834 with a few "unofficial" settler representatives. In 1813 most of the British East India Company's privileges were abolished (the company's last monopoly on the Chinese trade ended in 1833), after which the number of merchants increased and shipping trade expanded. After 1813 the Dutch loan farm system—whereby white colonists paid a small annual fee to the government but did not acquire ownership of

the land—was gradually replaced with a virtual freehold system of landownership.

British drive toward the Fish River

In 1820 a large group of British settlers arrived. Together with a high white birth rate and wasteful land usage, this produced an accentuated land hunger. To secure colonial hegemony and to alleviate the settler land shortage, the British applied massive military intervention against Africans on the eastern frontier. Until the 1840s the British did not envisage the colony expanding to include African ("Kaffir") citizens: the latter were to be expelled across the Fish River, the unilaterally proclaimed eastern border of the colony.

The first step in this process was the onslaught of the British army against the Zuurveld Gqunukhwebe and Ndlambe in 1811–12. In the aftermath of this war, Graham's Town (now Grahamstown) was established as the military pivot of a line of forts. The removal of about 20,000 people eastward across the Fish aroused tensions that British governors exploited by divide-and-rule strategies. This exacerbated tensions between the Ngqika and the Ndlambe and Gcaleka, leading to the Battle of Amalinda in 1818. The Thembu and Mpondo farther east were established as British allies against all three of these peoples. An Ndlambe attack on Graham's Town in 1819 provided the pretext for the annexation of the next swath of African territory, to the Keiskamma River. The 1820 settlers took the African lands. Khoi soldiers were settled along the Kat River in 1829, and Rharhabe groups (*e.g.*, Maqoma's) were repeatedly harried from their lands in the early 1830s. When the Rharhabe despairingly counterattacked in December 1834, Governor Benjamin D'Urban ordered the colossal invasion of 1835; thousands of Rharhabe were killed. In April 1835 the British crossed the Great Kei River and ravaged Gcaleka territory; on May 12 they murdered the Gcaleka chief, Hintsa. Only the intervention of the British colonial secretary, Lord Glenelg (to the fury of the settler expansionists), halted the seizure of all African land to the Great Kei. D'Urban's pioneering attempt to rule conquered Africans with white magistrates and soldiers was overturned by Glenelg; instead, for a time, Africans east of the Keiskamma retained their autonomy and dealt with the colony through diplomatic agents.

A chronic problem for the British was how to procure labour to develop the new settler farms and to build the towns. Britain abolished its slave trade in 1807 and pressured other nations to do the same. Some slaves continued to be imported into the Cape after 1807 (for example, "prize negroes"—slaves seized by the Royal Navy and reenslaved in the Cape), but they were not enough. An 1809 ban on Africans crossing the border aggravated the labour shortage, and the British, like the Dutch, were forced to enserf the Khoi (by the Caledon and Cradock codes of 1809 and 1812).

Anglo-Boer commandos illegally captured San women and children (exterminating many of the men), as well as Africans from across the eastern frontier. More serfs (called "apprentices") were captured by the Griqua raiding states led by Andries Waterboer, Adam Kok, and Barend Barends along the Vaal, Molopo, and Caledon rivers from among the Taung, Hurutshe, Rolong, Kwena, and Fokeng peoples. The prisoners, known as Mantatees, were imported mainly into the eastern Cape in exchange for firearms, gunpowder, and horses; they were set to work on the farms. One Griqua raid on an unidentified people at Dithakong in 1823 was accompanied by the British government agent John Melvill and the Kuruman missionary Robert Moffat. White farmers also raided for labour north of the Orange River.

Changes in labour policy

The need to align the Cape with the growing imperial antislavery ethos and to facilitate labour distribution produced an overhaul of labour policy in 1828. Ordinance 50 freed the Khoi to choose their employers but brought little tangible change to their positions; innumerable disincentives existed if they preferred not to work. Ordinance 49 permitted black labourers from east of the Keiskamma to come into the colony for work under control of contracts and passes issued by soldiers and missionaries. At first this permission was insufficient, and in August 1828 Anglo-Boer armies (supported by Khoi, Thembu, Gcaleka, and Mpondo auxiliaries) attacked the Ngwane east of the Great Kei at Mbolompo, returning with prisoners. More spectacularly, in its operations of 1835, the British army and its Khoi and African collaborators seized thousands of Rharhabe and Gcaleka women and children. Known as "Fingo," they were dispatched as labourers throughout the Cape, so that by 1837 the Cape Colony's labour supply was assured, though only temporarily. Ironically, these illegal measures coincided with the formal abolition of slavery in 1834–38. Ex-slaves, Khoi and Fingo, were now controlled by the Masters and Servants Ordinance of 1841. This imposed criminal penalties for breach of contract and desertion of the workplace and increased the legal powers of settler employers.

Historic states of South Africa.

The Delagoa Bay slave trade. Concurrent with these events in the Cape, the slave trade at Delagoa Bay had been expanding since about 1810 as the Brazilian plantations grew. During the late 1820s, slave exports from the Delagoa Bay area reached several thousand a year, in anticipation of what proved to be an ineffective attempt to abolish the Brazilian trade in 1830. After a dip in the early 1830s, the Bay slave trade reached a peak in the late 1840s.

The impact on hinterland societies was increasingly profound. Makhasane's Maputo and other groups became surrogate slavers and joined the Portuguese soldiers in inland raiding. Along the Limpopo and Vaal river networks Bay slavers competed with Griqua slavers supplying the Cape. The Gaza and Jele near St. Lucia moved north to slave; the Jele, or Ngoni, later resituated themselves west of Lake Nyasa, liaising with Arab slavers. Slavers burned crops, and famines were common. Many groups, including the Ngwane, Ndebele, and some Hlubi, fled westward into the Highveld mountains during the 1810s and '20s. The Ngwane were attacked in sequence by Bay, Griqua, and British slavers. The Patsa (Kololo) of Sebetwane, on the other hand, moved east out of Transorangia, ran into Bay slavers, migrated west into Botswana, where in 1826 they were attacked by an alliance of Ngwaketse and white mercenaries, and ended in Zambia in the 1850s exporting slaves to the Arabs and Portuguese. These migrations all produced further destabilizations.

Emergence of the eastern states. By the 1820s four main defensive state clusters had emerged between the Soutpansberg and the Drakensberg: Sekwati's Pedi in the Steelpoort valley, Sobhuza's Dlamini in the eastern Transvaal, the Mokoteli of Moshoeshoe (Mshweshwe) in the Caledon River region, and Shaka's Zulu south of the Black Mfolozi River. The Pedi received refugees from the Limpopo and coastal plains. Moshoeshoe's people absorbed refugees from throughout eastern Transorangia;

they became formidable raiders and by the mid-1830s were able to defeat the Griqua and Korana raiders. Between about 1812 and 1825 Shaka welded the Chunu, Mthethwa, Qwabe, Mkhize, Cele, and other groups into a militarized state with fortified settlements called *amakhanda*. Zulu *amabutho* (regiments) defended against raiders, provided protection for refugees, and, the evidence suggests, began to trade in ivory and slaves themselves.

From 1824 the Zulu faced competition from Cape colonists who came to Port Natal (renamed Durban in 1835) and organized mercenary armies. Although on a smaller scale, these were comparable to the Portuguese *prazero* armies along the Zambezi and to the warlord state set up by the Portuguese trader João Albasini in the Soutpansberg in the 1840s. During the 1820s European raiders joined Zulu *amabutho* in raids north of the Black Mfolozi River and also operated south of the Mzimkhulu River—where slaves were being exported on French ships in 1825. In 1828 Francis Farewell's raiders, in alliance with Zulu groups, seized women and children in the same area. Trade conflicts helped split the Zulu elite into rival factions, a split that led to Shaka's assassination in 1828. The succession of Shaka's half brother, Dingane, was accompanied by civil wars and by increasing interference in the Bay trading alliances. In 1833 the Portuguese governor at Lourenço Marques (now Maputo), Ribeiro, was killed in one of these wars. White warlords in Natal such as Henry Flynn, Nathaniel Isaacs, and John Cane continued to slave and hunt elephants. By the mid-1830s consortia of Cape merchants were planning the formal colonization of Natal with its superb agricultural soils and temperate climate. The British left the less desirable Delagoa Bay region to the Portuguese, who traded slaves out of Lourenço Marques for another half-century.

Raids of the 1820s

The expansion of white colonialism, *c.* 1835–1870. *The Great Trek.* After about 1834 a previous trickle of Boer migrants north of the Orange River suddenly became an organized flood. This later became known as the "Great Trek." The common view that this was a bid to escape the policies of the British—for instance, the freeing of the slaves—is difficult to sustain, as most of the ex-slave owners did not migrate (most trekkers came from the poorer east Cape), and in 1835 the labour shortage had been alleviated. The trek was the explosive culmination of a long sequence of colonial labour raids, grazing probes, land seizures, punishment commandos, and commercial expansions. Whites possessed weaponry that was always technologically one step ahead of that of the Africans. They also had the instructive examples of how small groups of raiders in Natal and Transorangia had wrought havoc over large areas and how the British army had induced terror in Africans. The trekkers were not backward feudalists escaping the modern world, as some historians have maintained; they were energized people extending their frontier. The trek was as inevitable a development as the North American colonists' push across the Alleghenies in the 1760s.

Several thousand Boers migrated with their families, livestock, retainers, wagons, and firearms into a region already destabilized and partially depopulated by Griqua and coastal raiders. Only when they came up against Mzilikazi's Ndebele (who in the early 1830s had moved from the southeastern to the western Transvaal) were they confronted, as at Vegkop in 1836. However, the Boers—in alliance with Rolong, Taung, and Griqua allies—crushed the Ndebele during 1837, taking their land and many cattle, women, and children. The Ndebele fled north, resettling around the Matopo and Malungwane hills in Zimbabwe.

By the early 1840s the trekkers had penetrated much of the Transvaal. A grouping of commando states emerged based on Potchefstroom, Pretoria, and, from 1845, Ohrigstad-Lydenburg in the eastern Transvaal. Andries Hendrik Potgieter, Andries Pretorius, Jan Mocke, and others competed for followers, attacked weaker African chiefdoms, hunted elephants and slaves, and forged trade links with the Portuguese. The development of farms was slow and inevitably depended on forced labour, as had been the case in the Cape prior to the 1830s. For a quarter of a century until the 1860s, moreover, the Pedi and Swazi in the east and even Kwena and Hurutshe groups in the west were strong enough to curb Boer expansionism.

Other Boers turned east into Natal and allied themselves with the resident British settlers. There was an inescapable confrontation between this coalition and Dingane's Zulu. The Zulu, though like the Ndebele scoring initial successes, were overpowered at Blood (Ncome) River in 1838 and the AmaQonqo Hills in 1840. The Boers, aided by Zulu civil war, annexed land to the Black Mfolozi River and set up Mpande as a puppet over the much-reduced Zulu kingdom. Colonial military strategies perfected along the Fish and Great Kei rivers in the eastern Cape were transplanted to the Tugela and Pongola. The whites began to carve out farms in Natal as they had done along the eastern frontier. Further slave and cattle raids on Ncaphayi's Bhaca south of the Mzimkhulu provided the pretext for British annexation of Natal in 1843. The Zulu were returned land between the Mfolozi and Tugela and for the time being left independent. Mpande (reigned 1840–72) was a formidable ruler and further built up Zulu military capacity, which his son, Cetshwayo, used effectively against the British invaders at Isandlwana in 1879.

The move into Natal

The British in Natal. The coming of thousands of British settlers to Natal in the 1840s and '50s meant that for the first time black Africans and white settlers lived together (however uneasily) on the same land. In 1845 a diplomatic agent (later secretary of native affairs) was appointed: Theophilus Shepstone—a prototype of later chief native commissioners. Reserves for blacks were set aside (Harding Commission, 1852), and missionaries and pliant chiefs were introduced to persuade them to work. After 1849 Africans were subjected to a hut tax that was designed to raise revenue and force them into labour; *isibhalo* (forced) labour was used for road building; and Africans on state land and white farms were made to pay rents. To meet these burdens, the more resilient African cultivators—or squatters—grew surplus crops to sell to the growing towns of Pietermaritzburg and Durban.

The British were reluctant, though, to annex the Transorangian interior. No strategic interests were involved. Boer trade links with Delagoa Bay posed little threat, as Portugal was a virtual client state of Britain. The tasks of eroding African resistance and developing the land were left to the Boers. The policy was muddled and never clearly enunciated. Financial constraints operated. A half-hearted attempt was made to protect Britain's long-standing Griqua client states. Sir George Napier in 1843 and Henry Warden in 1849 attempted to arbitrate a border between Moshoeshoe's Sotho state and the Boers west of the Caledon River. After further war with the Rharhabe on the eastern frontier in 1846, the aggressive governor, Colonel Harry Smith, in 1847–48 finally annexed the regions between the Fish and the Great Kei rivers (establishing British Kaffraria) and between the Orange and Vaal (Orange River Sovereignty). These moves provoked further war with the Xhosa (joined once more by many Khoi) in 1851–53 and a free-for-all in the sovereignty, with unsupported British politicians ineffectively trying to influence events.

Smith's annexation

A striking feature of this period was the capacity of the Sotho people to fend off military conquest by the British and Boers. After defeating and absorbing the rival Tlokwa of Sekonyela in 1853–54, Moshoeshoe became the most powerful African leader south of the Vaal-Pongola. His soldiers utilized firearms and, in the cold Highveld, horses—the keys to political and military survival.

Attempts at Boer consolidation. Faced with these unprofitable conflicts, the British temporarily withdrew, and the Transvaal and Orange Free State Boers were given independence at the Sand River and Bloemfontein conventions of 1852 and 1854, respectively. The access of Africans to guns and gunpowder was prohibited. Both Boer groups wrote constitutions and established Volksraade (parliaments), although their attempts at unification failed. For more than a decade consolidation among the Boers was hampered by civil wars and the struggle with the material environment. Nevertheless, the Orange Free State's economy grew rapidly, and by the 1860s the Boers were exporting significant amounts of wool via Cape ports.

The Cape economy. Capitalist infrastructure came earlier in the Cape because of its older colonialism and its seacoast links to the empire. Banks and insurance and limited-liability companies were founded in the 1840s and '50s. The ending of ceilings on interest rates in 1860 attracted capital, which was loaned against rising property values. A class of prosperous colonial shopkeepers, financiers, traders, and farmers emerged. Cape Town grew to more than 30,000 people in the 1850s. Port Elizabeth, established in 1820, became an important trading centre and harbour. Representative government came in March 1853: the Legislative Assembly had elected members, but an executive was appointed from London; only in 1872 was the executive made responsible to the assembly. Franchise qualifications were relatively low. Some Africans could even vote, but the numbers were too small to have political impact. These nominal rights were reduced later in the century and abolished outright in 1936.

Legal restrictions on land and labour

The colonial attacks of 1811, 1819, 1835, 1846, 1851, and 1858 deprived Africans of most of their land between the Sundays and Great Kei rivers and produced impoverishment and despair. From 1855 British magistrates were imposed in British Kaffraria, and the power of the Xhosa chiefs was destroyed. Following a severe lung sickness epidemic in 1854–56, the Xhosa killed many of the remaining cattle and in 1857–58 were unable to grow many crops (for reasons that are still not entirely clear). The subsequent starvation drove yet more thousands of Africans into the Cape Colony to work. In British Kaffraria, as in Natal, the hut tax was introduced in 1849. African citizens of the Cape Colony (Fingo) were controlled under the Masters and Servants Act of 1856 (an updating of Ordinance 50 of 1828 and the 1841 ordinance), and non-Cape Africans were regulated by the Kaffir Employment Act of 1857 (an updated version of Ordinance 49). In 1865 British Kaffraria was fused with the Cape Colony, and thousands of newly defined Fingo resettled east of the Great Kei, thereby creating Fingoland. The Transkei—the hilly country between the Cape and Natal—became a large African reserve, the still independent parts of which were annexed in the 1880s and '90s. Mpondoland fell in 1894.

White missionaries and their black catechists worked sedulously from the 1820s to undermine African cosmologies and seduced Africans into desiring European manufactures they had previously done well without. The techniques for destroying African cultures and for forcing Africans to work pioneered in the Cape and Natal were exported to the rest of Africa after the 1880s. For a time, nevertheless, there was room for a small class of African peasant farmers (producing for the market and liable for rents and taxes), who used plows and sold surplus grain to the towns in competition with colonial farmers. Difficulty in obtaining capital, as well as legal and political discrimination, drove most of them out of business in the decades following the South African War of 1899–1902.

The Cape economy, narrowly based on wine and wool, was not particularly prosperous. Wool exports, though soaring to 12,000,000 pounds (5,440 metric tons) in 1855, lagged far behind those of Australia and were susceptible to drought and market slumps, as in the early 1860s. Roads were built with African labour, but only a few miles of railway were constructed before 1870. Attempts to broaden the economic base were not at first successful. Guano (droppings of gannets and cormorants used as fertilizer) was exploited on off-coast islands; copper began to be mined in Namaqualand; hunters operating as far as the Zambezi sent out much ivory; and traders, hunters, missionaries, and full-time prospectors surveyed and sampled the rocks. The efforts of the last were rewarded with the discovery of diamonds in the Vaal valley and of gold in the Tati valley in 1866–67 and in the northern and eastern Transvaal in 1871.

Disputes in the north and east. To the north, colonial communities and the African states cooperated and competed with each other, the advantage slowly moving to the colonists. Mswati's Dlamini Swazi and Manukosi's (Soshangane's) Gaza supplied slaves both to the Transvaal Boers and to the Portuguese. Mswati's people overran much of the Lowveld, incorporating many groups (the *emakhandzambile*) and exchanging captured children for firearms and horses with the Transvaal settlers. The death of Manukosi in 1858 led to a Gaza civil war in which the Swazi, the Boers, and the Portuguese all intervened. In 1864, when Mswati controlled the land almost to Lourenço Marques, the Gaza (under the victor, Mzila) migrated northward into the Búzi River area of eastern Zimbabwe.

Swazi-controlled areas

Farther south the Zulu competed with the Swazi and the Boers to dominate the Pongola and Ingwavuma valleys and with the Boers to control the Buffalo (Mziniathi) River area. A Zulu civil war in 1856 (the Battle of Ndondakasuka on the lower Tugela River) elevated Cetshwayo over Mbuyazwe, and he effectively ruled Zululand from the early 1860s. Shepstone interfered not only in Zulu politics but also in an Ndebele succession dispute, attempting to oust Lobengula in favour of a pretender in 1869–72. Marthinus Pretorius, the Transvaal leader, annexed huge areas, at least on paper. To the irritation of settler farmers and plantation owners, few Zulu went south to work in Natal. Instead, a supply of Mozambican indentured labourers (some of them effectively forced) was organized. This evolved in the following decades into a steady flow of migrant labour. However, initially there was not enough labour to satisfy the new sugar plantations, and, from about 1860, indentured labourers from India were brought over to do the work.

Moshoeshoe's Sotho continued their tenacious hold on their lands along the Caledon River and were for a time able to supply the Boers of the Orange Free State with grain and cattle. The Boers, however, coveted the fertile Caledon valley. Moshoeshoe mobilized 10,000 men to defeat them in the war of 1858; but, with the consolidation of the Orange Free State under Johannes Henricus Brand in the early 1860s, the Sotho were defeated in 1865–66 (Treaty of Thaba Bosiu, 1866), and only British annexation of Moshoeshoe's territory in 1868 prevented complete Sotho collapse.

The decline of the African states. As the 1860s came to an end, the great African states began to weaken. This was symbolized by the death of a generation of powerful leaders: Manukosi in 1858, Sekwati of the Pedi in 1861, Mswati and Mzilikazi in 1868, Moshoeshoe in 1870, and Mpande in 1872. Just as in Germany, Italy, Canada, and Australia, so in southern Africa capitalism required the unification of communications, currencies, financial institutions, and governments. Besides, the Zulu, Swazi, and Pedi were needed as labourers, and their land—the last large fertile areas controlled by Africans—was coveted.

Governor George Grey had already proposed a federated South Africa in 1858, and in the late 1860s the discovery of gold and diamonds brought matters forward. The annexation of Basutoland in 1868 was followed by the British seizure of the diamond fields from the competing Griqua, Tlhaping, and Boers in 1871 (the Keate Award); Colonial Secretary Lord Carnarvon's more determined federation plan of 1875; Shepstone's invasion of the Transvaal in 1877; and the British invasions of Zululand and Pediland in 1879. A bid to seize Delagoa Bay was overturned by the arbitrating French president, Patrice, Count de MacMahon, in 1875; and Swaziland was left to collapse internally. With the collapse of Zulu resistance in the 1880s, the invasions of the Gaza and Ndebele kingdoms in 1893–96, and the crushing of Venda resistance in 1898, there were by 1900 no autonomous African societies left in the subcontinent. (J.R.D.C.)

Diamonds, gold, and imperialist intervention (1870–1902). Between 1870, when the diamond rush to Kimberley began, and 1902, when the South African War ended, South Africa was transformed. Midway between these dates, the world's largest goldfields were discovered in 1886 on the Witwatersrand. An economic backwater became a major supplier of precious minerals to the world economy. A scatter of disparate statelets—British colonies, Boer republics, and African kingdoms—came under British control. Predominantly agrarian societies began to urbanize and industrialize. Political responses included a nascent Afrikaner nationalism and the first modern political organization in black societies. These dramatic changes were propelled by two linked forces:

the development of a capitalist mining industry and a sequence of imperialist interventions by Britain.

Diamonds and confederation. A chance find in 1867 drew several thousand fortune seekers to alluvial diamond diggings along the Orange, Vaal, and Harts rivers. In 1870 richer finds were made in "dry diggings," and a large-scale rush followed. By the end of 1871, nearly 50,000 people were living in a sprawling, polyglot mining town that in 1873 was named Kimberley.

Initially, individual diggers, black and white, worked small claims by hand. Production was rapidly centralized and mechanized, and ownership and labour patterns more starkly divided along racial lines. Joint-stock companies bought out diggers; a new class of mining capitalists oversaw a transition from diamond digging to mining industry. By 1889 concentration became monopoly when De Beers Consolidated Mines (controlled by Cecil Rhodes) became the sole producer. While some white diggers were kept on as overseers or skilled workers, the workforce consisted mainly of African migrant workers, housed in closed compounds by the companies from the mid-1880s.

Diamonds were discovered in a zone whose sovereignty was already disputed. The Orange Free State, the South African Republic, the western Griqua under Nicolaas Waterboer, and southern Tswana chiefs all pressed competing claims. At a special hearing in October 1871, Robert W. Keate (lieutenant governor of Natal) found in favour of Waterboer. Waterboer was persuaded to request British protection against his Boer rivals, and the area was annexed as Griqualand West.

Annexation of Griqualand West

The annexation of the diamond fields signaled a more forward policy under a Liberal ministry but fell short of the ambitious confederation policy pursued by Lord Carnarvon, colonial secretary in Benjamin Disraeli's 1874 Tory government. He sought to unite republics and colonies as a self-governing federation in the British Empire. Carnarvon was influenced by Theophilus Shepstone, secretary for native affairs in Natal, who urged a coherent regional policy with regard to African labour and administration.

Carnarvon concentrated at first on persuading the Cape and the Free State to accept federation. A conference in London in August 1876 revealed how chilly these parties were to the proposal. His southern gambit frustrated, Carnarvon embarked on a northern strategy. The South African Republic (Transvaal) was virtually bankrupt, and support for President Thomas F. Burgers was dwindling. During the London conference, news arrived of a military humiliation of Burgers' forces at the hands of Sekhukhune's Pedi. Carnarvon commissioned Shepstone to annex the Transvaal. Shepstone entered the republic in January 1877 and against only token resistance proclaimed it a British colony in April.

Deft as the annexation was, administration of the new possession was maladroit. Empty coffers and insensitivity to Afrikaner resentments led to a clash over tax payments, and, under a triumvirate of Paul Kruger, Piet Joubert, and Marthinus Wessel Pretorius, the Transvaal Boers opted to fight for independence. British defeats, especially at Majuba, hastened a decision to which William Gladstone's cabinet was already inclined. Republican self-government was restored, subject to an imprecise British "suzerainty" over external relations. Confederation received its quietus with these events.

Wars of conquest. Seizure and retrocession of the Transvaal overlapped with a sequence of wars that completed the conquest of African societies. Imperial troops tipped the balance decisively against societies that had previously withstood subordination to settler control. A century of military conflict on the Cape frontier ended with the Cape-Xhosa war of 1877–78, and between 1878 and 1881 the Cape Colony defeated rebellions in Griqualand West, the Transkei, and Basutoland. Sir Bartle Frere, governor of the Cape and high commissioner for southern Africa from March 1877, rapidly decided that independent African kingdoms must be tamed if political and economic integration of the region were to become reality.

The Zulu War

Frere identified Cetshwayo's Zulu kingdom as a major obstacle to confederation. An impasse was engineered, and British and colonial troops invaded Zululand in January 1879. The annihilation of a large British force at Isandhlwana slowed the invasion, but imperial firepower ultimately prevailed. For the Zulu, political dismemberment followed upon military defeat. Divide-and-rule policies precipitated civil war in 1883, and in 1887 Zululand was annexed. British troops also took part in 1879 in a campaign that crushed Pedi military power in the northern Transvaal.

Afrikaner and African politics in the Cape. By the mid-1870s, 240,000 whites in the Cape constituted about one-third of the colony's population. Cape revenues accounted for three-quarters of the total income in the region's four settler states in 1870, and the diamond discoveries stimulated railways, public works, banking, and commerce. Although by 1870 some two-thirds of the settler population spoke Dutch or Afrikaans, political power was exercised largely by an English-speaking elite of merchants, lawyers, and landholders. In the last quarter of the century, heightened political and cultural awareness among Cape Afrikaners took organized form, and the period also saw new forms of political expression and mobilization among black voters.

The Afrikaner Bond, founded in 1880, initially represented poorer farmers and espoused an anti-British Pan-Afrikanerism in the Cape and beyond. By 1883, however, under Jan Hendrik Hofmeyr, the organization was realigned. Supported mainly by wealthier farmers and urban professionals, the Bond championed the Cape's commercial interests within a framework of regional British imperial dominance. In 1890 Hofmeyr threw his support behind Cecil Rhodes, enabling the latter to become prime minister of the Cape. The Rhodes-Hofmeyr alliance was based on their mutual desire for economic expansion northward.

A major cleavage opened between Bond politicians and English speakers loosely defined as Cape liberals. The latter grouping had material as well as ideological interests in the prosperity of an African peasantry, and in several eastern Cape electoral districts black voters were crucial in electing liberal "friends of the native." The Bond was hostile toward a commercializing black peasantry and pursued more restrictive franchise qualifications.

The piecemeal annexation of the Transkeian territories to the Cape between 1872 and 1894 greatly increased the number of Africans in the colony. Peasant production for local markets and the emergence of literate clerks and teachers enabled individuals to qualify for the vote. The rise of the Afrikaner Bond and new laws affecting franchise qualifications and taxes stimulated more vigorous African participation in electoral politics after 1884. In the eastern Cape, new political and educational bodies were created, as were the first African newspapers and African-controlled churches. The period also witnessed the first political organizations among Coloureds in the Cape and Indians in Natal and the Transvaal.

Gold mining. In 1886 prospectors established that a 40-mile belt of gold-bearing reefs existed, centring on modern Johannesburg. The rapid growth of a gold-mining industry intensified processes started by the diamond boom: immigration, urbanization, capital investment, infrastructural development, proletarianization, and labour migrancy. By 1899 the gold industry employed 109,000 people (of whom 97,000 were African migrant workers); it produced 27 percent of the world's gold and had attracted investment worth £75 million.

The world's richest goldfield was also the most difficult to work. Although abundant, the layers of gold-bearing rock ran extremely deep, and the gold content of the ore was low. To be profitable, gold mining had to be intensive and deep-level with large inputs of capital and technology. These factors ensured that production was in corporate hands almost from the outset, and amalgamation of companies proceeded rapidly. By 1898, 124 companies were arranged in nine holding companies, or "groups."

Organization of the gold industry

The group system facilitated collusion between companies to reduce competition over labour, the costs of which were crucial to their profitability. The gold mines rapidly established a pattern of labour recruitment, remuneration, and accommodation that left its stamp on subsequent

social and economic relations in the country. White immigrant miners, because of their skills, scarcity, and political power, were able to win relatively high wages. African migrants from throughout southern Africa, especially from Mozambique, were unskilled and low-paid (earning at century's end about one-ninth the wage of white miners). The mine magnates sought assiduously to limit the ratio of white to black workers and to peg migrant wages as low as possible. Migrant miners were housed in compounds, which facilitated their control and reduced overhead costs.

The road to war. Even before gold was discovered, the South African interior was an arena of tension and competition. Germany annexed South West Africa in 1884. The Transvaal claimed territory to its west, which Britain countered by creating the Bechuanaland protectorate and annexing the crown colony of British Bechuanaland. Rhodes secured concessionary rights to land across the Limpopo River, founded the British South Africa Company, and in 1890 dispatched a pioneer column to occupy what became known as Rhodesia.

While these forces jostled for position in the region at large, the domestic politics of the South African Republic became unsettled. Few 19th-century states could have adjusted with ease to the changes engendered by the gold discoveries, and certainly not a preindustrial society ruled by agrarian notables, whose president believed the world was flat. Although Paul Kruger's government made strenuous efforts to accommodate the mining industry, it was soon at loggerheads with Britain, the mine magnates, and the Uitlander ("Outlander") immigrants.

British policymakers were anxious about the Transvaal's potential as an independent actor; deep-level-mine owners chafed at corruption and inefficiency; and Uitlanders were largely excluded from the vote. In the event, Uitlander grievances provided both cause and cover for a conspiracy between British officials and mining capitalists. An Uitlander uprising in Johannesburg would be supported by an armed invasion from Bechuanaland, headed by Leander Starr Jameson, Rhodes's lieutenant, and the high commissioner would intervene to "restore order."

The Jameson Raid

The plot was botched. The Uitlander rising was called off; Jameson went ahead with his incursion in December 1895, but within days he and his force were rounded up. Rhodes had to resign as prime minister of the Cape; British Colonial Secretary Joseph Chamberlain managed to conceal his complicity. The raid polarized Anglo-Boer sentiment in South Africa, simultaneously exacerbating republican suspicions, Uitlander agitation, and imperial anxieties. The last of these had the greatest purchase, especially with the arrival in April 1897 of Sir Alfred Milner as high commissioner and governor of the Cape.

In February 1898 Kruger was elected to a fourth term as president. He entered a series of negotiations with Milner over the issue of the Uitlander franchise. Milner declared in private early in 1898 that "war has got to come" and adopted intransigent positions. The Cape government, headed by William P. Schreiner, attempted unavailingly to mediate. Marthinus Steyn, Free State president, also tried to avert war, even while he attached his cause to Kruger's. In September 1899 the two Boer republics served a last-ditch ultimatum on Britain. On its expiration on October 11, Boer forces invaded Natal.

Britain went to war to secure its hegemony in southern Africa, the Boer republics to preserve their independence. These motives were sharpened by the "new imperialism" of the late 19th century and by competing local interests. Ultimately they led to war because the discovery of gold on the Transvaal Highveld had dramatically shifted the economic centre of gravity in the region, raising the stakes and firming the resolve of the main players.

The South African War, 1899–1902. An expensive and brutal colonial war lasted two and a half years. It pitted almost 500,000 imperial troops against 87,000 republican burghers, Cape "rebels," and foreign volunteers. The numerical weakness of the Boers was offset by their familiarity with the terrain and support from the Afrikaner populace, plus the poor generalship and dated tactics of the British command. Although it was often styled a "white man's war," both sides used blacks extensively as labour, and at least 10,000 Africans fought for the British.

In the first phase of the war, Boer armies took the offensive and in December 1899 ("Black Week") punished British forces at Colenso, Stormberg, and Magersfontein. During 1900 Britain rushed reinforcements to the front; relieved sieges at Ladysmith, Kimberley, and Mafeking; and took Bloemfontein, Johannesburg, and Pretoria. In a third phase, Boer commandos eschewed conventional engagements and waged guerrilla warfare. The British commander, Lord Kitchener, devised a scorched-earth policy against the commandos and the rural population supporting them. Farms were destroyed, the countryside blockaded, and the civilian population rounded up into concentration camps. Some 25,000 Afrikaner women and children died of disease and malnutrition in these camps; 14,000 Africans died in separate camps: in Britain the Liberal leader charged the government with winning the war by "methods of barbarism."

Civilian casualties

In May 1902, Republican forces—reduced to about 20,000 exhausted and demoralized troops—sued for peace. The Treaty of Vereeniging reflected the conclusive military victory of imperial power but made a crucial concession. It promised that the "question of granting the franchise to natives [Africans]" would be addressed only after self-government had been restored to the erstwhile Boer republics. The treaty thus consigned the political fate of the black majority to the decision of white minorities.

Reconstruction, union, and segregation (1902–29). The Union of South Africa was born on May 31, 1910, parented by constitutional convention and an act of the British Parliament. The infant state owed its conception to centralizing and modernizing forces generated by mineral discoveries. Its character was shaped by eight years of "reconstruction." Between 1902 and 1910, efficient administrative structures were established, the economic dominance of gold was consolidated, and a modus vivendi was struck between Afrikaner politicians and mining capitalists. Reconstruction also ensured that settler minorities would prevail over the black majority. Prewar property relations were restored; African societies were policed and taxed more effectively, and the new constitution excluded Africans from political power. Policies proposed during reconstruction pointed toward racial segregation, which became the governing orthodoxy after 1910.

These years witnessed high levels of social and political conflict. Syndicalist white workers and Afrikaner republican diehards fought against employers and government, their clashes culminating in the Rand Revolt of 1922. New political vehicles for Afrikaner and African nationalism were constructed. Black protests against the new order ran from genteel lobbying and passive resistance to armed rural revolt, strikes, and mass mobilization.

Milner and reconstruction. In 1902 Milner transferred his headquarters from Cape Town to Pretoria. The move symbolized the centrality of the Transvaal to his mission of constructing a new order in South Africa. When Milner departed in 1905, his vision of a country politically dominated by English-speaking whites had foundered. Schemes to flood the rural Transvaal with British settlers yielded only a trickle. Compulsory Anglicization in education fanned Afrikaner nationalism instead of snuffing it out. Opposition to "Milnerism" defined the emergent political groups led by ex-Boer generals Louis Botha, Jan Smuts, and J.B.M. (Barry) Hertzog. Milner had hoped to withhold self-rule from whites in South Africa until "there are three men of British race to two of Dutch." But, when Henry Campbell-Bannerman's Liberal ministry granted responsible government to the ex-republics, Afrikaner parties—Het Volk (The People) and Oranje Unie (Orange Union) in Transvaal and the Orange Free State, respectively—won elections in 1907.

"Milnerism"

Yet, if Milner's political design failed to take shape, his blueprints for economic and social engineering were largely realized. Served by a "kindergarten" of handpicked young administrators, he made economic recovery a priority. It was imperative to restore the mines to profitability. Rail rates and tariffs on imports were lowered, and the expensive concessions granted by the Kruger regime were abolished. Milner also made strenuous efforts to ensure

cheap labour to the mines. He authorized the importation of some 60,000 Chinese indentured labourers when African migrants resisted wage cuts. Although this experiment provoked political outcries in the Transvaal and in Britain, it succeeded in undercutting the bargaining power of African workers. The value of gold production swelled from £16 million in 1904 to £27 million by 1907. Chinese miners were restricted to certain tasks, setting the precedent for a statutory colour bar in the gold mines.

The administration strove to remodel the Transvaal as a stable base for agricultural, industrial, and finance capital. Some £16 million was spent on returning Afrikaners to their farms and equipping them. Scientific farming methods were promoted, a land bank was established, and more efficient tax collection increased pressures on black peasants to work for white farmers. Central and local government bureaucracies were overhauled. Especially on the Witwatersrand, the "kindergarten" tackled town planning, public transport, housing, and sanitation. In each of these spheres, a new urban geography proceeded from the principle of separating white and black workers.

The Native Affairs Commission

The South African Native Affairs Commission (SANAC) was appointed to provide comprehensive answers to what was called "the native question." Its 1905 report proposed territorial separation of black and white landownership, systematic urban segregation by the creation of African "locations," the removal of black "squatters" from white farms and their replacement by wage labourers, and the segregation of blacks from whites in the political sphere. These (and other SANAC recommendations) provided the basis for laws passed between 1910 and 1936.

Convention and union. The new Liberal government was no more careless of British interests in South Africa than its Conservative predecessor, but it sought to secure those interests through collaboration and consent. Granting responsible government to the ex-republics was the first step in this direction. Concern in London over the electoral victory by Het Volk was short-lived. It was soon clear that Botha and Smuts accepted as axiomatic the economic preeminence of mining capital. The political corollary to this was accommodation between local and imperial political interests, expressed as a policy of "reconciliation" between Afrikaans- and English-speaking whites. The way was clear for the second stride: political unification of the region.

A constitution was drafted by a national convention, which met in Durban in 1908–09. Afrikaner leaders, and Cape Premier John X. Merriman, opted for a unitary state with parliamentary sovereignty. Four provinces enjoyed limited powers. Executive authority was vested in a governor-general, advised by a cabinet from the governing party. A technical issue, pregnant with consequences, was the delimitation of electoral constituencies so as to favour overrepresentation of rural voters. Afrikaner nationalism was the major beneficiary in subsequent years.

Two "entrenched" clauses, on language and franchise, could be amended only by a two-thirds majority vote in Parliament. Dutch and English were made official languages, reflecting the parity at the convention of Afrikaner and English-speaking delegates. The franchise issue underlined that all delegates were white males. Female suffrage was never countenanced, and imperial collaboration with settler communities was achieved at the expense of blacks. While Cape delegates favoured a colour-blind franchise, those from the Transvaal and Orange Free State demanded an exclusively white electorate. A compromise simply confirmed existing electoral arrangements. The ex-republics retained white male adult suffrage: in Natal the franchise was effectively all-white; in the Cape the vote was open to men who met property and literacy qualifications. In 1910, 85 percent of Cape voters were white, 10 percent Coloured, and only 5 percent African. Representation was further limited on racial lines: even in the Cape, only whites might stand for Parliament.

Black political responses. The South African War was fought when many black communities were hard-pressed. During the 1890s, drought and cattle disease impoverished pastoralists, and competition increased for African land and labour. During the war most black South Africans identified with the British cause, encouraged by the assertions of imperial politicians that "equal laws, equal liberty" for all races would prevail after a Boer defeat.

The Treaty of Vereeniging brusquely reneged on such promises. A sense of betrayal stimulated political protest, especially among mission-educated Africans. A multitude of organizations sprang up; their leaders sought to meet the impending union of white-ruled provinces by uniting Africans over regional and ethnic divides. While the constitutional convention deliberated, the South African Native Convention met in Bloemfontein. The first instance of coordinated action among the fledgling political associations, it was an important step toward the formation of a permanent national organization. This took place on Jan. 8, 1912, with the founding of the South African Native National Congress (later African National Congress).

Founding of the ANC

Parallel developments took place among politically conscious Coloureds. The first nationally based organization was the African Political (later People's) Organization, founded in Cape Town in 1902. Under the presidency of Dr. Abdullah Abdurahman, this body lobbied for Coloured rights and linked at times with African political groups. Indians in the Transvaal, led by Mohandas K. Gandhi, also resisted discriminatory legislation. Gandhi spent the years 1893 to 1914 in South Africa as a legal agent for Indian merchants in Natal and the Transvaal. Between 1906 and 1908, in protest against a Transvaal registration law requiring Indians to carry passes, Gandhi first implemented the methods of satyagraha (nonviolent noncompliance), which he later used with such effect in India. Not all black protest was conducted through the new middle-class organizations. In 1906 peasants in Natal refused to pay a poll tax, and their resistance developed into an armed rising, led by a chief named Bambatha. At the end of this "reluctant rebellion," between 3,000 and 4,000 Africans had been killed and 7,000 imprisoned.

Union and disunity. Louis Botha formed the first Union government on May 31, 1910, supported by the majority party in each province and by the British government. These auspices were of limited benefit as his administration entered a period of flux and violent conflict. Tensions stemmed from issues left unresolved by the constitution, from rapid but uneven economic growth and its attendant social antagonisms, and from the legacy of conquest and dispossession of indigenes by colonists.

A major axis of conflict ran between employers and organized white workers. On the Witwatersrand the Chamber of Mines and miners' trade unions were locked in combat for a decade and a half. Violent confrontations took place in 1907, 1913, and 1914. On each occasion the government deployed troops to end the strikes. White workers suspended strike action during World War I, but militancy flared again in 1919, fueled by inflation. The Chamber of Mines, squeezed by rising costs and a falling gold price, announced in December 1921 that it intended replacing semiskilled white workers with lower-paid Africans. The miners' protest stoppage in January 1922 became a general strike, and in March it developed into an armed rising, with strikers organized as commandos. Smuts, prime minister since Botha's death in 1919, used artillery and aircraft to crush the Rand Revolt, at a cost of some 230 lives. The phase of intense conflict between white unions and employers ended with the passage of the Industrial Conciliation Act in 1924, which set up new state structures for regulating industrial conflicts.

The Rand Revolt

Black workers also engaged in sporadic strikes before, during, and after World War I, and the first African trade unions emerged. In February 1920, 71,000 African gold miners struck for higher wages and lower prices, halting production for a week. Soldiers and police broke the strike, at a cost of 11 lives and more than 100 miners injured. This strike was part of a wave of protest in several cities, as inflation eroded the real wages of black workers.

In Port Elizabeth police fired on a crowd of demonstrators, killing 23 and wounding 126: Abdurahman called it "South Africa's Amritsar." Higher casualties occurred in May 1921, when troops killed 183 members of a religious sect, the "Israelites," who had occupied land at Bulhoek in the Cape and refused to leave it. In 1922 in South

West Africa (administered by South Africa as a League of Nations mandate territory from 1920), the Smuts government launched a military expedition against the Bondelzwarts people, who resisted a dog tax. More than 100 of the Bondelzwarts died. Hertzog listed these incidents in Parliament when he said of Smuts that his "footsteps dripped with blood."

Afrikaner rebellion and nationalism. Hertzog also cited the death toll of the Afrikaner Rebellion of 1914. When Britain declared war on Germany, South Africa's dominion status meant that it was automatically at war, and its troops were mobilized to invade German South West Africa. This sparked a rebellion led by former Boer generals, who were high-ranking officers in the Union Defence Force. More than 11,000 men, mainly poverty-stricken rural Afrikaners, joined the rising. The government used 32,000 troops to suppress it, and more than 300 men lost their lives in the fighting.

The rebellion, though, was a convulsive and atypical episode in the rise of Afrikaner nationalism as a political force. More telling and durable responses came from Afrikaner strata profoundly affected by economic change, war, and reconstruction. After 1902 thousands of landless families streaming into the cities indicated how the prewar rural social order had crumbled. One response to the threat of further disintegration was a "second language movement," spearheaded by teachers, clergymen, journalists, and lawyers deeply threatened by the cultural dominance of English speakers. It succeeded in its immediate aim when Afrikaans replaced Dutch as an official language in 1925; it also played a vital role in shaping Afrikaner self-awareness.

Hertzog's National Party

These forces—"poor whites" and militant intellectuals—provided much of the backing for the National Party founded by Hertzog in 1914. In the general election of 1915, the National Party won 30 percent of the poll, as Afrikaners deserted the South African Party led by Botha and Smuts. In 1920, on a platform of republicanism and separate school systems for Afrikaans- and English-speaking whites, Hertzog won a majority of both seats and votes. Smuts formed a government by allying with the strongly pro-empire Unionist Party. In 1923 the National Party entered into an electoral pact with the Labour Party. The combined voting strength of aggrieved white workers and anti-British nationalists swept Smuts from office. Hertzog headed a coalition government, known after the electoral agreement as the Pact government.

Segregation. In the first two decades of the Union, segregation became a distinctive feature of South African political, social, and economic life. It was promoted as actively under the South African Party (1910–24) as it was in the years when Hertzog was premier (1924–39). New statutes provided for racial separation in industrial, territorial, administrative, and residential spheres. It is less than helpful to explain this barrage of legislation as the product of reactionary attitudes inherited from the past. Rather, segregation represented efforts to regulate class and race relations during a period of rapid industrialization, a set of mechanisms for achieving both economic development and the maintenance of white supremacy. Indeed, the central institutions of 20th-century segregation—migrant labour, reserves, compounds, and urban locations—took shape around the gold-mining industry.

The 1911 Mines and Works Act and its 1926 successor reserved certain jobs in mining and the railways for white workers. The Natives Land Act of 1913 defined 8 percent of South Africa as African "reserves" and prohibited any purchase or lease of land by Africans outside the reserves. The law also restricted the terms of tenure under which Africans might live on white-owned farms. The Native (Urban Areas) Act of 1923 provided for segregating urban residential space and created "influx controls" to reduce access to cities by Africans. In 1926 Hertzog published bills proposing simultaneously to increase reserve areas and remove African voters in the Cape from the common roll. These aims were realized in legislation 10 years later.

The Pact years, 1924–29. The Pact government strengthened South African autonomy from Britain, aided local capital, and protected white workers against black competition. Despite the rhetoric of its election campaign, the government did little to harm the interests of the mining industry.

Hertzog played a leading role in the imperial conference that issued the Balfour Report (1926), establishing autonomy in foreign affairs for the dominions. Much parliamentary energy was consumed in wrangles over the symbols of nationalism—flag and anthem. Economic nationalism included protective tariffs for local industry, subsidies to facilitate agricultural exports, and a state-run iron and steel industry. White trade unions grew more bureaucratic and less militant, although their members enjoyed at best modest material gains. More direct benefits were enjoyed by unskilled and nonunionized whites who were aided through sheltered employment in the public sector and through prescribed minimum wages in the private sector. Although the overall level of white poverty remained high, these policies saw the manufacturing sector absorb white labour nearly twice as fast as black. In this, as in other respects, the real losers during the 1920s were Africans.

Effects of economic nationalism

For Africans, segregation meant restricted mobility, diminished opportunities, more stringent controls, and a general sense of exclusion. Economic conditions in the reserves were deteriorating, on white farms the terms of tenancy became more onerous, and the urban slums provided a harsh alternative for those who left the land. The middle-class leadership of the African National Congress (ANC) had pressed for the extension of the Cape franchise to other provinces. By 1926 it was evident that even this slender link to central political institutions was under threat of severance.

These conditions prepared the ground in which the first mass-based African political organization flourished. The Industrial and Commercial Workers Union (ICU) was until 1926 a Cape-based union with African and Coloured members drawn mainly from urban areas. It became a mass-based vehicle of rural protest, drawing scores of thousands of supporters from African tenants on white farms. The ICU linked innumerable local rural grievances with a generalized call for land and liberation. By 1929 the ICU was a spent force; unable to meet the expectations it raised in the countryside, it fell apart into several feuding factions.

The mushroom growth of the ICU stimulated radicalism in other organizations. Some ANC leaders, especially Josiah Gumede (president, 1927–30), moved leftward in the late 1920s. The Communist Party of South Africa, founded in 1921, was at first active almost solely within white trade unions, but from 1925 it recruited African members more energetically, and in 1928–29 it called for black majority rule and closer cooperation with the ANC.

These political challenges to white supremacy were reflected in the 1929 general election. For the first time since union, questions of "native policy" dominated white electoral politics. Afrikaner nationalists made "black peril" and "communist menace" their rallying cry. It was not to be the last such occasion. (C.J.B.)

The 1930s. The central theme in the history of South Africa since 1930 is the creation and eventual supersession of the most stringent system of racial segregation and discrimination that the world has known. The local whites, who never formed more than about one-fifth of the total population and were fewer than one-seventh by the 1990s, dominated the South African economy as well as the parliamentary institutions that they had inherited from Great Britain, at the expense of the Africans, Coloureds, and Indians. By 1976 white South Africans had constructed a rigid racial system known as apartheid ("apartness"), which caused untold misery and poverty and had become notorious throughout the world. The apartheid regime then began to fall apart as a result of internal resistance and fundamental changes in the distribution and exercise of power in the neighbouring states and the world beyond. By 1989 there was a stalemate. Some white political leaders realized that the regime was losing control of the country, while their opponents were aware that they lacked the means to overthrow it. There ensued a complex series of negotiations, culminating in the creation of a new, nonracial constitution, the election of a new parliament by

universal adult suffrage, and the inauguration of Nelson Mandela as president of South Africa.

In the early 1930s the South African cabinet was composed of members of the National Party, which held a majority of the seats in the House of Assembly and drew its main support from Afrikaner farmers and intellectuals. The major parliamentary opposition was the South African Party—the party of most of the English-speaking whites, who formed about 45 percent of the white population and included the major industrialists. In 1931 the Hertzog government achieved a major goal when the British Parliament passed the Statute of Westminster, which removed the last vestiges of British legal authority over South Africa. In 1934 the South African Parliament made that decision watertight in South African law by enacting the Status of the Union Act. Meanwhile, the Hertzog government had been losing support through its mismanagement of the problems created by the Great Depression, and in 1933 the prime minister decided to form a coalition with his rival Smuts, the leader of the South African Party. A year later the two organizations merged to form the United Party, with Hertzog as prime minister and Smuts his deputy.

The Statute of Westminster

The two parties and the two leaders had a common interest in favouring the enfranchised population, nearly all of whom were white, at the expense of the unenfranchised, all of whom were black. They agreed in providing massive support for white farmers; in assisting whites to rise above poverty, by providing them with jobs protected from black competition; in endorsing the mining industries' continued use of migrant African workers; in excluding Africans from participation in the conciliation machinery for settling industrial disputes; and in trying to curb the movement of Africans from the reserves into the towns. Furthermore, in 1936, with an overwhelming majority, Parliament removed from the ordinary voters' rolls those relatively few Africans who were qualified to vote; in return, it entitled Africans in the Cape Province to elect three white representatives to the House of Assembly and Africans throughout the Union to elect indirectly four white senators. It also created a Natives Representative Council with advisory powers.

After 1933, with the improvement in the international economy as the Western powers recovered from the depression, the white farmers prospered, new secondary industries were established, and South Africans of all races began to flock to the towns. South Africa was transformed from an overwhelmingly rural country, producing primary commodities for export and importing manufactured consumption goods, into a country with a diverse and nearly self-sufficient economy. However, although the standard of living of most whites improved greatly from this expansion, there was scarcely any improvement in the lives of Africans, Coloureds, and Indians. The government did add some land to the reserves, but these never exceeded 13 percent of the area of the country, and their condition was deteriorating through overpopulation and soil erosion, making it necessary for a high proportion of the men to work for wages outside the reserves, on the white farms or in the towns. There they were in an unfriendly world. African and Coloured farm labourers, scattered in small groups throughout the agricultural areas, were the most deprived of all South Africans. In the towns, life was insecure for Africans, and wages were low. In the gold-mining industry, the real wages of Africans declined by 15 percent between 1911 and 1941, when white miners were paid 12 times as much as Africans.

Role of mission schools

The education of Africans was left to Christian missions, whose resources, augmented by small government grants, enabled them to find places for only a small proportion of the African population. Missionaries did, however, run numerous schools, including some excellent high schools that took a few pupils through to the university matriculation level. Missionaries also were the dominant influence in the South African Native College at Fort Hare, which they had founded in 1916 and which included degree courses. These institutions educated a small but increasing number of Africans, who secured jobs as teachers, in the lower reaches of the civil service, or as clergy (especially in the independent churches, which had broken away from mainstream white churches). Frustrated by the fact that whites did not treat them as equals, some of them took part in opposition politics in the ANC. However, the ANC and two parallel movements—the African Political Organization (a Coloured group) and the South African Indian Congress—had little popular support and exerted scarcely any influence over the main course of events. Their leaders were mission-educated men who had liberal goals and used strictly constitutional methods, such as petitions to the authorities. The radical African ICU had collapsed by 1930, and the Communist Party of South Africa, founded in 1921, made little headway among Africans at that time.

World War II. When Britain declared war on Germany on Sept. 3, 1939, the United Party split. Hertzog proposed that South Africa should be neutral, but Smuts opted for joining Britain. Smuts's faction narrowly won the crucial parliamentary debate, the Hertzogites left the United Party, Smuts became prime minister, and South Africa declared war on Germany.

South Africa made significant contributions to the Allied war effort. Some 135,000 white South Africans fought in the East and North African and Italian campaigns, and 70,000 Africans and Coloureds served as labourers and transport drivers. South African platinum, uranium, and steel were valuable resources and, during the many months while the Mediterranean Sea was closed to the Allies, Durban and Cape Town provisioned a vast number of ships en route from Britain to Suez.

The war was an economic bonanza for South Africa. Stimulated by the reduction of imports, the manufacturing and service industries expanded rapidly, and the flow of Africans and others to the towns, already under way since 1933, became a flood. By the war's end, there were more Africans than whites in the towns. These Africans set up vast squatter camps on the outskirts of the white cities, improvising shelters from whatever materials they could find. They also began to flex their political muscles. They boycotted a Witwatersrand bus company that tried to raise fares; they formed trade unions; and, in 1946, 74,000 African gold miners went on strike for higher wages and improved living conditions.

The government suppressed that strike brutally but had no clear program for the future. White intellectuals proposed a series of reforms within the segregation framework, and the government and private industry made a few concessions, easing the industrial colour bar, increasing African wages, and relaxing the pass laws. However, the government failed to discuss these problems with black representatives. It lost credibility in the eyes of educated Africans in 1946 when it snubbed the Natives Representative Council for criticizing its handling of the miners' strike and calling for the removal of discriminatory legislation.

Afrikaner political organizations

Meanwhile, Afrikaners had created a series of ethnic organizations to promote their interests, including an economic association, a federation of Afrikaans cultural associations, and the Broederbond, a secret society of Afrikaner cultural leaders. In 1934 Daniel F. Malan, a former Dutch Reformed minister, had refused to follow Hertzog's Nationalists when they fused with the South African Party to form the United Party. Instead, he formed a new Purified National Party, which became the official parliamentary opposition. During the war many Afrikaners welcomed the early German victories—some of them committed acts of sabotage—but Malan's party adhered to constitutional methods and gradually gained support from Afrikaner clergy and intellectuals as well as from Afrikaans cultural and economic associations.

The United Party, which had won a general election in 1943 by a large majority, approached the 1948 election complacently. However, its policy statements were equivocal on race relations, while the National Party claimed that the government's weakness was threatening white supremacy and produced a statement that used the word apartheid to describe a program of tightened segregation and discrimination. With the support of a tiny fringe group, Malan's National Party won the election by a narrow margin.

Apartheid. After winning the 1948 election, the Na-

tional Party rapidly consolidated its control over the state, and in subsequent years it won a series of elections with increased majorities. In 1956 Parliament removed the Coloured voters from the common voters' rolls. To do that, the government packed the Senate with its nominated supporters to gain the two-thirds majority in a joint session of both houses required by the constitution. The 1956 law also entitled Coloured people to elect four whites to represent them in Parliament, but that arrangement did not last long. In 1969 the government abolished those seats that had represented Coloured voters, thus making the electorate exclusively white. Indians had never had parliamentary representation, and the seats of white representatives of Africans were abolished in 1959.

The Republic of South Africa

In 1961, with the approval of a majority of the white voters in a referendum the previous October (but without consultation with any Africans, Coloureds, or Indians), South Africa became a republic. The government had hoped that the country would follow a 1947 precedent, when India became a republic but continued to be a member of the Commonwealth, but, meeting criticism from other Commonwealth members, it withdrew South Africa from that loose association.

At home, the government vigorously furthered its ethnic goals. It made it compulsory for white children to attend schools that were conducted in their home language, either Afrikaans or English (except for the few who went to private schools). It advanced Afrikaners to top positions in the civil service, the army, the police, and the state corporations, such as the South African Broadcasting Corporation, which had a monopoly of radio services. It also awarded official contracts to Afrikaner banks and insurance companies. These methods raised the living standards of Afrikaners closer to those of English-speaking white South Africans.

Except for a recession during the early 1960s, the economy grew rapidly until the late 1970s. By that time, with a mixture of public and private enterprise, South Africa possessed a modern infrastructure, which was by far the most advanced in Africa: efficient financial institutions, a national network of roads as well as railways, modernized port facilities in Cape Town and Durban, and, besides the long-established diamond-, gold-, and coal-mining industries, a wide range of factories. The private sector was dominated by two great interlocking giants: the Anglo American Corporation of South Africa, founded by Ernest Oppenheimer in 1917, and De Beers Consolidated Mines. They formed the core of one of the world's most powerful networks of mining, industrial, and financial companies, employing 800,000 workers on six continents. State corporations controlled industries that were vital to national security, notably Armscor (Armaments Corporation of South Africa), which produced high-quality military equipment, and SASOL (South African Coal, Oil, and Gas Corporation), which alleviated South Africa's lack of petroleum resources by converting coal to gasoline and diesel fuel.

Program of Hendrik Verwoerd

This burgeoning economy was buoyant enough to sustain the cost of a drastic program of social engineering. The man who played the major part in transforming apartheid from an election slogan into practice was Hendrik F. Verwoerd. Born in The Netherlands, Verwoerd immigrated with his parents to South Africa when he was a child. He became a nominated senator in 1948, minister of native affairs in 1950, and prime minister from 1958 to 1966, when a deranged man assassinated him in Parliament. According to Verwoerd, the South African population comprised four distinct racial groups (white, African, Coloured, and Asian), each with an inherent culture; whites were the "civilized" group and, as such, entitled to control the state.

Parliament passed a plethora of laws to give effect to these ideas and to institutionalize the apartheid system. The Population Registration Act (1950) classified every South African by race. There were laws to prohibit interracial marriage or sex. Other laws and regulations segregated South Africans in every sphere of life: in buses, taxis, and hearses; in cinemas, restaurants, and hotels; in trains and railway waiting rooms. When a court declared that separate amenities should be equal, Parliament passed a special law to override it. Under the Group Areas Act (1950), the cities and towns of South Africa were divided into segregated residential and business areas, and the government removed thousands of Coloureds and Indians from areas classified for white occupation.

A vast bureaucracy, staffed largely by party loyalists, administered apartheid, aided by a mass of coercive laws. The Suppression of Communism Act of 1950 defined communism and its aims sweepingly and empowered the government to detain anyone it deemed likely to further any communist aims. Later laws gave the police the right to arrest and detain people without trial and without access to families or lawyers and left the courts with scarcely any means to intervene.

Africans were treated as "tribal" people, domiciled in the reserves under hereditary chiefs and bound to live there except when they were working for whites. In 1951 the government abolished the Natives Representative Council. Then it began to consolidate the scattered reserves into 8 (eventually 10) distinct territories, designating each of them as the "homeland" of a specific African ethnic community. It also manipulated homeland politics so that compliant chiefs controlled the administrations of most of those territories. Claiming to match the decolonization process that was taking place in tropical Africa, the government devolved powers onto those administrations and eventually encouraged them to become "independent." Between 1976 and 1981 four accepted independence: Transkei, Bophuthatswana, Venda, and Ciskei. However, like the other homelands, they were economic backwaters, dependent on subsidies from Pretoria, and not a single foreign government recognized them.

The "homelands"

Conditions in the homelands rapidly deteriorated, partly because they had to accommodate vast numbers of additional Africans. Attempting to reverse the flood of Africans into the towns, the government strengthened the pass laws, making it illegal for an African to be in a town for more than 72 hours without a job in a white home or business. By 1983, in a particularly brutal series of forced removals, it had ejected more than 3.5 million Africans from the towns and from white rural areas (including lands they had occupied for generations) and dumped them in the reserves.

The government also established direct control over the education of Africans. In the Bantu Education Act of 1953, it took African schools away from the missions. Then, to meet the expanding economy's increasing demand for semiskilled black labour, it created more African schools, especially in the lower grades, but subjected the students to stringent discipline and prescribed syllabi and textbooks that endorsed official policies.

A 1959 law prohibited the established universities from accepting black students, except with special permission on an individual basis. Instead, the government created five new ethnic university colleges—one for Coloureds, one for Indians, one for Zulus, and one for Sotho, Tswana, and Venda students, plus a medical school for Africans—and transformed the South African Native College at Fort Hare, which missionaries had founded primarily but not exclusively for Africans, into a state college solely for Xhosa students. It staffed these ethnic colleges with white supporters of the National Party and subjected the students to stringent controls.

Resistance to apartheid. Apartheid imposed appallingly heavy burdens on most South Africans. The economic gap between the wealthy few, nearly all of whom were white, and the poor masses, virtually all of whom were African, Coloured, or Indian, was larger than in any other country. The whites were well fed, well housed, and well cared for; Indians, Coloureds, and especially Africans suffered from widespread poverty, malnutrition, and disease. Consequently, despite the growth of the national economy, for most South Africans life was a struggle for day-to-day survival.

Nevertheless, during the 1950s the previously moribund ANC came to life under a vigorous president, Albert Lutuli, and three younger men—Oliver Tambo and Nelson Mandela, who ran a joint law practice in Johannes-

burg, and Walter Sisulu. In cooperation with the South African Indian Congress, which also had been revitalized, they organized a passive resistance campaign in 1952, when thousands of volunteers defied discriminatory laws. Three years later, in conjunction with Indians, Coloureds, and sympathetic whites, they convened a mass meeting (Congress of the People) that adopted the Freedom Charter, asserting that "South Africa belongs to all who live in it, black or white, and no Government can justly claim authority unless it is based on the will of the people." The government broke up the meeting and subsequently arrested 156 people and charged them with high treason. None was found guilty, but the trial dragged on until 1961, when the last of the accused were released.

The Freedom Charter

In 1959 a group of Africans led by Robert Sobukwe, a language teacher at the University of the Witwatersrand, believing that the alliances with white, Coloured, and Indian organizations had impeded the struggle for African liberation, broke away from the ANC and founded the Pan-Africanist Congress (PAC). On March 21, 1960, the PAC launched a fresh campaign. Thousands of unarmed Africans invited arrest by presenting themselves at police stations without passes; at Sharpeville, near Johannesburg, the police opened fire on such a crowd, killing at least 67 and wounding more than 180 Africans, most of whom were shot in the back as they were running away. Thousands of workers then went on strike, and in Cape Town 30,000 Africans marched in a peaceful protest to the centre of the city. The government reestablished control by force: it mobilized the army, outlawed the ANC and the PAC, and arrested more than 11,000 people under emergency regulations.

These events led to a change in the strategy of the congresses. Previously, they had confined themselves to nonviolent methods. After Sharpeville, however, the ANC and PAC leaders and some of their white sympathizers came to the conclusion that black people would never overcome apartheid by peaceful means alone. Violence, they concluded, was a necessary and legitimate means of resistance to the violence of an illegitimate regime. However, although their military units detonated several bombs in government buildings during the next few years, the ANC and the PAC did not pose a serious threat to the state, which had a virtual monopoly of modern weapons. By 1964 the government had captured many of the leaders, including Mandela and Sobukwe, and sentenced them to long terms of imprisonment on Robben Island in Table Bay, four miles from Cape Town. Hundreds of others fled the country. Oliver Tambo presided over an exiled ANC executive in Zambia.

A new phase of resistance began in 1973, when black trade unions organized a series of strikes for higher wages and improved working conditions. Moreover, Steve Biko and other African students founded a Black Consciousness movement that appealed to Africans to take pride in their own culture. That ideology was immensely attractive to young Africans. On June 16, 1976, thousands of children in Soweto, the African township outside Johannesburg, demonstrated against the government's insistence that they should be taught in Afrikaans rather than in English. Police opened fire, touching off a nationwide cycle of protest and subsequent repression. Once again the government reestablished control by force. Within a year, it had banned many more organizations and the police had killed more than 500 people, including Biko. Those events received worldwide execration. In 1973 the UN General Assembly had declared apartheid to be "a crime against humanity," and in 1977 the UN Security Council unanimously voted a mandatory embargo on the export of arms to South Africa.

The Black Consciousness movement

The unraveling of apartheid. By 1978 the illusion that apartheid would bring peace to South Africa was shattered. Most of the homelands were economic and political disasters. Their only significant export was labour, and most of their leaders were corrupt and unpopular. The national economy was in recession. Skilled whites were emigrating, and inflation was running high. Moreover, the global environment was changing. The Portuguese had handed over the government of Angola and Mozambique to Africans in 1974–75, and the writing was on the wall for Ian Smith's white regime in Rhodesia (which would come under African control as Zimbabwe in 1980). Increasingly isolated as the last bastion of white racial domination, South Africa had become the focus of global denunciation.

By that time, the National Party was passing under the control of a new class of urban Afrikaners—businessmen and intellectuals who, like their English-speaking white counterparts, believed that reforms should be introduced to appease foreign and domestic critics. The first attempt to give effect to their ideas occurred after Pieter W. Botha, who had been a National Party politician throughout his adult life, succeeded John Vorster as prime minister in 1978. Botha's administration applied a mixture of carrots and sticks. It repealed the bans on interracial sex and marriage; desegregated many hotels, restaurants, trains, and buses; removed the reservation of skilled jobs for whites; and repealed the pass laws. Provided that black trade unions registered, they were entitled to access to a new industrial court and permitted to strike. Also, a new constitution created separate parliamentary bodies for Indians and for Coloureds and vested great powers in an executive president, namely P.W. Botha.

P.W. Botha's reforms

However, the Botha reforms stopped short of making any real change in the distribution of power. The white parliamentary chamber could override the Coloured and Indian chambers on matters of national significance, and all Africans remained disenfranchised. The Group Areas Act and the Land Acts maintained residential segregation. Schools and health and welfare services for Africans, Indians, and Coloureds remained segregated and inferior, and most nonwhites, especially Africans, were still desperately poor. Moreover, Botha used the State Security Council—which was dominated by military officers—rather than the cabinet as his major policy-making body, and he embarked on a massive military buildup.

In 1979, in an effort to limit South Africa's economic domination of the region, South Africa's black neighbours formed the Southern African Development Coordinating Conference (SADCC), but it made little progress. Most of the export trade of the region continued to pass through South Africa to South African ports, and South Africa provided employment for 280,000 migrant workers from neighbouring countries. Botha also used South Africa's military strength to restrain those countries from pursuing antiapartheid policies. He kept South West Africa/Namibia under South African domination, sent military raids into every other southern African state, and assisted the Renamo rebels in Mozambique and the UNITA faction in its civil war in Angola.

During the 1980s the conservative British and American administrations of Margaret Thatcher and Ronald Reagan, respectively, faced increasingly vociferous pressures for sanctions against South Africa. In 1986 a high-level Commonwealth mission went to South Africa in an unsuccessful effort to persuade the government to suspend its military actions in the townships, release political prisoners, and stop destabilizing neighbouring countries. Later that year, American public resentment of South Africa's racial policies was strong enough for the U.S. Congress to pass a Comprehensive Anti-Apartheid Act over a presidential veto, banning new investments and loans, ending air links, and prohibiting the importation of many commodities. Other governments took similar actions.

Meanwhile, in 1983, 1,000 black and white representatives of 575 community groups, trade unions, sporting bodies, and women's and youth organizations launched the United Democratic Front. There followed a vast escalation of strikes, boycotts, and attacks on black police and urban councillors. Under strong pressure from white hawks, the Botha government resisted those pressures. In 1985 it declared a state of emergency in many parts of the country; a year later it promulgated a nationwide state of emergency and embarked on a savage campaign to eliminate all opposition. For three years police and soldiers patrolled the African townships in armed vehicles, destroying black squatter camps and detaining, abusing, and killing thousands of Africans, while the army also continued its forays into neighbouring countries. Rigid

The 1986 state of emergency

censorship laws tried to conceal those actions by banning television, radio, and newspaper coverage. (L.M.T.)

The brute force used by the government did not halt dissent. Long-standing critics such as Anglican Archbishop Desmond Tutu, the 1984 Nobel Peace Prize laureate, defied the government, and influential Afrikaner clerics and intellectuals withdrew their support. Resistance by black workers continued, and saboteurs caused an increasing number of deaths and injuries. The economy was severely affected, and in 1988 the army suffered a military setback in Angola, leading to the independence of Namibia in 1990. Given these circumstances, many whites came to realize that there was no stopping the incorporation of blacks into the South African political system.

Government officials held several discussions with Nelson Mandela, the imprisoned ANC leader, as these events unfolded, but Botha balked at the idea of allowing blacks to participate in the political system. An inner party coup against Botha in August 1989 forced him to step down as both party leader and president. The National Party parliamentary caucus chose F.W. de Klerk, the party's Transvaal provincial leader, as his successor. De Klerk exhibited more sensitivity to the dynamics of a world where the blatant racism that still existed in South Africa could no longer be tolerated and announced a program of radical change in a dramatic address to Parliament in February 1990; Mandela was soon released from prison. During the next year Parliament repealed the basic apartheid laws, lifted the state of emergency, freed many political prisoners, and allowed exiles to return to South Africa.

Postapartheid South Africa. *The Mandela presidency and transition to majority rule.* Nelson Mandela was elected president of the ANC in 1991, succeeding Oliver Tambo. Mandela and de Klerk, who both wanted to reach a peaceful solution to South Africa's problems, met with representatives of most of the political organizations in the country, with a mandate to draw up a new constitution. These negotiations took place amid pervasive and escalating violence, especially in the southern Transvaal and in Natal. As the bargaining continued, both Mandela and de Klerk made concessions, with the result that both of them ran the risk of losing the support of their respective constituencies. While whites were loath to forfeit their power and privileges, blacks had hoped to win complete control of the state. A majority of white voters endorsed the negotiating process in a referendum in 1992, but both white and black extremists tried to sabotage the process through various acts of terror.

Mandela and de Klerk finally reached a peaceful agreement on the future of South Africa at the end of 1993, for which they jointly received the 1993 Nobel Prize for Peace. In addition, leaders of 18 other parties endorsed an interim constitution, which was to take effect immediately after South Africa's first election by universal suffrage, scheduled for April 1994. A parliament to be elected at that time would oversee the drafting of a permanent constitution for the country. The temporary constitution enfranchised all citizens over 18, abolished the homelands, and divided the country into nine new provinces, with provincial governments receiving substantial powers. It also contained a long list of political and social rights and a mechanism through which blacks could regain ownership of land that had been taken away under apartheid.

The ANC won almost two-thirds of the 1994 vote, the National Party slightly more than one-fifth, and the Inkatha Freedom Party (IFP) most of the rest; all three received proportional cabinet representation. Mandela was sworn in as president of the new South Africa in May. Thabo Mbeki, a top official in the ANC, and de Klerk both became deputy presidents.

The new, multiparty "government of national unity" aimed to provide Africans with improved education, housing, electricity, running water, and sanitation. Recognizing that economic growth was essential for such purposes, the ANC adopted a moderate economic policy, dropping the socialist elements that had characterized its earlier programs. Mandela and his colleagues campaigned vigorously for foreign aid and investment, but capital investment entered the new South Africa slowly.

The government also had to grapple with a host of institutional problems associated with the transition to a postapartheid society. Blacks joined the civil service; antiapartheid guerrillas became members of the police and the army; and new municipal governments that embraced both the old white cities and their black township satellites sprang into existence. Labour disputes, criminal violence, and conflict between Zulu factions, especially in KwaZulu/Natal, continued. The IFP refused to participate in the process that resulted in the creation of the new national constitution that Parliament passed in May 1996. Parliament revised the constitution in October after it was reviewed by the Constitution Court; Mandela signed it into law in December of the same year.

The most important domestic agency created during Mandela's presidency was the Truth and Reconciliation Commission (TRC), which was established to review atrocities committed during the apartheid years. It was set up in 1995 under the leadership of Archbishop Desmond Tutu and was given the power to grant amnesty to those found to have committed "gross violations of human rights" under extenuating circumstances. By the time the TRC delivered its five-volume report in 1999, more than 7,000 applications for amnesty had been reviewed; of those, about 150 had been granted.

The TRC was the target of widespread criticism: whites saw it as selectively targeting them, and blacks viewed its actions as a charade that allowed perpetrators of heinous crimes to go free. Nonetheless, the TRC uncovered information that otherwise would have remained hidden. For example, details of the murders of numerous ANC members were exposed, as were the operations of the State Counterinsurgency Unit. The commission also investigated those opposed to apartheid. One of the most prominent was Winnie Madikizela-Mandela, the former wife of Mandela, who served briefly as a deputy minister in 1994–95. Her attempts to achieve other offices ended when the TRC report indicated that she had been involved in apartheid-era violence.

South Africa since Mandela. Mbeki replaced Mandela as president of the ANC at an ANC conference held in December 1996, yet Mandela's announcement that he would not seek a second term as president still came as a surprise. In the June 1999 elections, the ANC increased its share of votes to more than two-thirds, and Mbeki formed a coalition government with the IFP and the Democratic Party. (L.M.T./J.R.D.C./Ed.)

For later developments in the history of South Africa, see the BRITANNICA BOOK OF THE YEAR.

Swaziland

The Kingdom of Swaziland is a small, landlocked country embedded in the eastern flank of South Africa, where it adjoins Mozambique. It is 6,704 square miles (17,364 square kilometres) in area and extends about 110 miles (175 kilometres) from north to south and about 80 miles from west to east at its largest dimensions.

The name Swazi is the Anglicized name of an early king and nation builder, Mswati II, ruler from 1840 to 1868. The administrative centre is Mbabane, the former capital of the British colonial administration; the national capital is the seat of King Mswati III and his mother, the Ndlovukati, at Lozitha and Ludzidzini; the houses of Parliament and other national institutions are situated at Lobamba.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief and soils.* A long and complex geologic history has created a landscape with a surprising variety of relief, climate, and soils for such a small country. There are four well-defined physiographic regions, extending longitudinally from north to south in roughly parallel belts. From west to east they are the Highveld, the Middleveld, the Lowveld, and the Lubombo (Lebombo) escarpment. Geologically, the oldest formations are in the west, and the youngest are in the east.

Physiographic regions

The Highveld, covering about 30 percent of the country, is a complex of granites and more ancient metamorphosed quartzites, sandstones, and volcanics that has been eroded

into a rugged mountain land. The average elevation is between 3,500 and 4,500 feet (1,100 and 1,400 metres); the highest points are the summit massifs of Bulembu (6,108 feet [1,862 metres]) and Ngwenya (5,997 feet [1,828 metres]) in the extreme west. Known to the Swazi as Inkangala (a cold, treeless place), the Highveld was the last part of the country to be settled. Its deeper-weathered red to yellow acid soils have developed on the gentler gradients and in river valleys.

The Middleveld occupies about one-fourth of the country and has an average altitude of 2,000 to 2,500 feet. It is a region of rolling uplands and wide, well-watered valleys. It is mainly underlain by ancient granites and gneisses (metamorphosed granites), with dolerites and quartzites, which have weathered deeply to produce friable red and clay loams interspersed with shallower profiles of sands and sandy loams. To the Swazi it is known as Live ("The Country") or Inkabave ("The Navel") and is the heartland of the Swazi nation.

The Lowveld, or Bushveld, covering nearly 40 percent of the country, is a generally undulating lowland with isolated knolls and ridges rising abruptly above the general level of 500 to 1,000 feet. In general, the soils reflect the transition from the acidic granites and sandstones of the western Lowveld to the more basic basalts and dolerites of the eastern part—*i.e.*, from sandy loams in the west to red and black clays in the east, the latter being some of the most naturally fertile soils in the country. This region is called Lihlanze by the Swazi, meaning a warm place with trees—in its undisturbed state, the typical African savanna.

The Lubombo escarpment and plateau covers about 5 percent of the country, consisting of a narrow strip of about 600 square miles. It rises abruptly from the Lowveld to an average altitude of 2,000 feet, with higher peaks (Siteki and Mananga) of about 2,500 feet in the north. It is deeply dissected by the gorges of three of the main rivers that traverse the country from west to east, the Umbuluzi, the Usutu, and the Ingwavuma. The plateau soils vary considerably, from shallow sands to deeper loams, depending on the composition of the volcanic lavas that form the bedrock. The Swazi have no specific name for this part of the country.

Drainage. Swaziland is one of the best-watered countries in southern Africa. Major perennial rivers, which have their sources in South Africa, flow through the country to the Indian Ocean. They are the Lomati, the Komati, the Umbuluzi, and the Usutu. The Usutu has the largest catchment in the country, with three main tributaries, the Usushwana, the Ngwempisi, and the Mkhondvo. In the south the Ingwavuma rises in western Swaziland and also cuts through the Lubombo.

Climate. The climate is in general subtropical, but it is strongly influenced by the country's position on the eastern side of southern Africa, which exposes it to moist maritime tropical air coming off the Indian Ocean for much of the year. The cessation of maritime airflow in winter months because of intensified continental winds produces a high degree of climatic variability. The climate is also subject to steep temperature and precipitation gradients from west to east because of the fall in altitude of about 4,000 feet over a distance of about 50 miles.

Average maximum and minimum monthly temperatures are 72° F (22° C) and 52° F (11° C) in the Highveld and 84° F (29° C) and 59° F (15° C) in the Lowveld. The Middleveld occupies an intermediate position in these gradations.

Rainfall patterns

Swaziland falls within the summer rainfall region of the subcontinent, where about 80 percent of the precipitation falls during the summer months of October to March, usually in the form of thunderstorms and frontal rains. Average annual rainfall in the Highveld is about 55 inches (1,400 millimetres), in the Middleveld 34 inches, in the Lowveld about 22 inches, and on the Lubombo about 35 inches. However, variability in the annual totals is great, and figures have fluctuated dramatically from year to year. In the Middleveld, where the bulk of the population lives, the average has varied from a high of 63 inches to a low of 13 inches within a period of a few years. These extreme fluctuations appear to relate to wetter and drier than average quasi-cyclic fluctuations of from 8 to 11 years, which have been identified in the rainfall records.

Plant and animal life. The natural vegetation includes forest—confined mostly to the Highveld and the windward slopes of the Lubombo escarpment—savanna, and grassland. Factors such as soil composition and moisture produce a variety of vegetation subtypes. There are both wet and dry forests, various densities of savanna, and several grassland types, which range from sweet to sour based on their palatability when mature and dry. Altogether it is a rich flora, with ferns and flowering plants alone accounting for more than 2,600 species. Some have a very limited distribution and are found only in or around Swaziland.

The natural fauna has been severely depleted in recent years because of habitat destruction caused by the spread of the human population, and representative species such as antelope (impala, reedbuck, duiker, waterbuck, wildebeest, and kudu), hippopotamus, rhinoceros, elephant, giraffe, and zebra are found largely in protected reserves. However, smaller mammals—such as the baboon, monkey, jackal, and mongoose—may still be encountered, and several types of snake have a wide distribution. Crocodiles are also common in Lowveld rivers. Birdlife is abundant in each habitat and comprises both resident and migrant (breeding and nonbreeding) populations. The migrants come from central and North Africa and from farther afield (northern Europe and eastern Asia in the case of storks, swallows, and hawks). Distinctive among the more common birds are barbets, weavers, the various hornbills, the lilac-breasted roller, and the purple-crested loerie.

Settlement patterns. Traditionally, the Swazi lived in family homesteads (*imithi*) dispersed throughout the countryside. The only larger settlements were the homesteads of royalty and chiefs. This pattern has been modified since the late 19th century by the exposure of the rural Swazi to the money economy. Nucleated settlements grew up at important administrative and trading centres under British colonial rule from 1903, but the process of urbanization accelerated only after World War II, when the establishment of major agricultural, mining, and industrial operations acted as magnets for job seekers and created sizable company towns such as Mhlume, Simunye, Big Bend, and Mhlambanyatsi. The largest are the administrative capital of Mbabane and the commercial and industrial centre of Manzini. Some 30 percent of the population is urban, and this figure is expected to increase because the urban growth rate exceeds the growth rate of the population as a whole.

The rural population lives within a communal land tenure system administered by the traditional chiefs. A typical homestead includes the main hut of the headman (*umnumzane*); the huts of his mother, wife (or wives), and children; the kitchen and storerooms; and the cattle enclosure (*isibaya*) in front and facing east. Cattle are more than draft animals and a source of milk; they constitute a store of wealth for use on social and ceremonial occasions (*e.g.*, lobola, or bride-price).

Pattern of homestead life

The traditional pattern of homestead life is strictly seasonal. With the onset of the rains in spring (August or September), women plant gardens along the riverbanks; later, when the heavy rains come in summer (October to February), with help from the men, they plow or hoe to sow corn (maize) and sorghum (a millet) in larger fields. At this time all able women and children abandon their homesteads for the fields, and the men also join in the planting and weeding. The summer months are, on the whole, the hungry months, unless supplemented by remittances from working members of the family. Autumn to early winter (March to May) is the harvest; by July the last of the corn and sorghum has been dried and brought in. Activity then moves to the homesteads, where women and men thresh the grain, the best of which is stored and the remainder consumed at once. Winter is a time for relaxation, hunting, entertaining, and visiting. To some extent this traditional round has been disrupted by population pressure on land, by increased drift to the towns, by the absence of men working in the cities, and by the use of hired tractors for plowing, but the basic pattern is still recognizable.

The traditional centres of Swazi life are the royal villages of the *ngwenyama* (the king) at Ludzidzini and of the *ndlovukazi* (the queen mother) at Phondvo, both of which are in the "royal heart" of the country and not far from the old royal capital of Lobamba.

Ethnic composition

The people. The Swazi nation is an amalgamation of more than 70 clans. Their chiefs form the traditional hierarchy under the *ngwenyama* and *ndlovukazi*, who are of the largest clan, the Dlamini. The amalgamation brought together clans already living in the area that is now Swaziland, many of whom were of Sotho origin, and clans of Nguni origin who entered the country with the Dlamini in the early 19th century. Traditional administration and culture are regulated by an uncodified Swazi Law and Custom, which is recognized both constitutionally and judicially. The language is siSwati, which is akin to Zulu, though it shares official status with English, which is in fact used generally for official written communication.

The Swazis comprise about 97 percent of the population, the remainder being immigrants from Mozambique, South Africa, and the rest of the world. Included among these are a few thousand Europeans and Asians and their families engaged in business activities.

The majority of Swazis belong to Christian churches, both Roman Catholic and Protestant, whose missions were responsible before independence for much of the education and health services, particularly in the rural areas. However, many adherents also retain the traditional beliefs and practices of the rest of the population.

The economy. Overall, the economy displays a marked duality of large-scale intensive production and small-scale semi-subsistence activities. This produces a great contrast in incomes and living standards, which tends to be obscured by average per capita statistics. National economic policy is based on the free enterprise or market philosophy, with fiscal measures to redistribute resources to education, health, and community improvement projects. Government revenue is derived principally from receipts from the Southern African Customs Union, sales tax, and corporate and personal taxation. The budget is generally in balance, but foreign aid is a major contributor to the capital or development budget, providing a buffer to help meet any deficit in revenue. Nevertheless, the dual economy persists, and the formal employment sector is unable to absorb the annual increment of new workers generated by the country's high population growth rate. Many workers, mostly men, are forced to seek employment as migrant workers, predominantly in South Africa. Labour relations in the country are at an embryonic stage, with a generally fragmented trade union movement pitted against a longer-established employers' association and with the government endeavouring to act as referee and arbiter.

Agriculture and forestry. About two-thirds of the population lives in the rural areas, where a mixture of subsistence and commercial farming is practiced. The staple crop is corn, and other crops include sorghum (mainly for the brewing of traditional beer), pumpkins, beans, peas, and other vegetables. Crop yields are generally low, but the more progressive farmers produce on a par with the large-scale commercial sector. Because of the role of cattle as a traditional store of wealth, the livestock population, mostly cattle and goats, greatly exceeds the country's carrying capacity and is a major cause of vegetation loss and soil erosion.

Commercial farming

Large-scale commercial farming is held mainly in the hands of foreigners, although since independence the Swazi nation has acquired a large stake in this sector, especially in the largest agro-industry, the cultivation of sugarcane and the manufacture of sugar. Also of major commercial importance are the extensive man-made forests of pine and eucalyptus (in the Highveld), which supply timber to a wood-pulp mill and several sawmills. Unbleached wood pulp is the country's second largest export after sugar. The area under timber plantations is about 6 percent of the country's total area. Other important crops are citrus fruits and cotton (Lowveld), pineapples (Middleveld), rice, tobacco, and vegetables. Commercial livestock farming is also important, particularly in the Lowveld, and supports meat processing and dairy plants.

Sawmill at the foot of a man-made forest of pine and eucalyptus trees in the Highveld of western Swaziland.

Industry. Mining has declined in relative importance since the 1960s, asbestos and coal in particular. Iron ore, tin, and gold have been exploited sporadically in the past, but no mines are now active. Since 1984 diamonds have been growing in importance and are now the second largest mineral export after asbestos.

The processing of agricultural, forest, and livestock products forms the backbone of the industrial sector. Other manufactures include textiles and clothing, which expanded enormously in the 1980s, beverages, office equipment, furniture, and various other light industries.

Tourism, particularly from South Africa, has become a major sector of the economy. Centred on the hotel and casino complex in the central Ezulwini valley (about seven miles from Mbabane), the sector boasts smaller complexes at Piggs Peak in the north and at Nhlangano in the south. High-quality handmade textiles and tapestries and a range of stone and wooden handicrafts complement this sector.

Finance and trade. Swaziland, Botswana, Lesotho, Namibia, and South Africa constitute the Southern African Customs Union, which provides generally for the free movement of goods and services throughout the area. Swaziland has its own currency, the lilangeni, but is also a member of the southern African monetary union (with Lesotho and South Africa), which seeks to ensure that currencies are on par and funds move freely between the member countries.

Apart from one bank that is wholly owned by the government, the commercial banks are subsidiaries of international (including South African) banks. As a consequence of these associations, most international trade is with South Africa as part of its regional trading network. Exports are largely raw materials or lightly processed products, essentially from the agro-forestry sector, while imports consist of machinery and transport equipment, fuels and lubricants, and foodstuffs.

Transportation. Good all-weather roads link the main population centres and extend to neighbouring South Africa and Mozambique. The railway, originally constructed from the western to the eastern border for the export of iron ore through Maputo in Mozambique, has been extended to provide links to the South African network in both the north and the south of the country. The national airport is at Matsapha, about five miles from Manzini, from which the national airline (Royal Swazi

National Airways) operates scheduled services to African destinations.

Administration and social conditions. *Government.* Executive authority is vested in the king and is exercised through a dual system of government. There is a cabinet of ministers appointed by the king and presided over by the prime minister. The cabinet advises the king and is responsible to a bicameral parliament. The House of Assembly comprises 50 members, of whom 40 are elected by an electoral college and 10 are appointed by the king. The Senate has 20 members, of whom 10 are elected by the House of Assembly and 10 are appointed by the king. The electorate consists of all citizens over the age of 18 grouped into 40 constituencies (*tinkhundla*), which each elect two members to an electoral college. Elections are held at no more than five-year intervals. There are no legally recognized political parties aside from the Imbokodvo National Movement.

Dual system of government

This formal system of government is paralleled by a less formal system of committees (*amabandla*) of other prominent members of the nation who advise the king directly. In addition, the Swazi National Council advises him on all matters regulated by Swazi Law and Custom and connected with Swazi traditions and culture.

The civil service is structured into ministries, each headed by a minister appointed by the king. Other civil servants are appointed by the prime minister within the framework of a civil service board appointed by the king. There is also a judicial service commission responsible for the appointment of judges and magistrates.

The judicial system comprises the Court of Appeal, with four members appointed by the king, the High Court, headed by a chief justice, and subordinate or magistrate's courts. There are also Swazi courts, two Swazi courts of appeal, and a higher Swazi appeal court, which is subordinate to the High Court. The Swazi courts hear cases only in which all those involved are Swazi and if the charges fall within a restricted list of criminal and civil matters.

Local government is administered through four regional councils (Hhohho, Lubombo, Manzini, and Shiselweni) comprising the members of the electoral college and headed by regional administrators appointed by the king. Urban government operates under elected or appointed municipal councils (in Mbabane and Manzini) and town boards (in the smaller townships).

Land ownership

Land ownership is one of the most sensitive issues in national life. Traditionally, all land is vested in the king in trust for the nation and allocated as communal land by the chiefs. In the late 19th century, however, much of the territory was alienated as land concessions to foreigners—as owners according to them but as lessees according to the Swazi. One of the first tasks of the British crown when it assumed direct control of Swaziland in 1906 was to try to reconcile the rights of the Swazi with those of the concession holders. In 1907 it decided to reserve one-third of the country for Swazi use and to allow the concessionaires to retain two-thirds, but by World War II little progress had been achieved. The real impetus came at independence when all the crown lands became national land; shortly afterward Britain agreed to finance the repurchase of nearly one million acres. Other land was also purchased privately by the nation. Swazi Nation Land now constitutes about two-thirds of Swaziland. The remainder is held under individual title, but some of this is also under Swazi ownership, both nationally and individually.

Education. Schooling was introduced as a part of missionary activity in precolonial times, and missionaries continue to influence the education system. The Swazi nation itself set up schools as early as 1906, and a number of chiefs established what were known as "tribal" schools. However, it was only after independence that the coverage of primary and secondary schools began to increase dramatically and to enable more than four-fifths of the school-age population to attend full-time. As a result, illiteracy is declining steadily. State education is not free, and school fees constitute a major financial commitment for parents. There are also teacher-training and vocational and industrial training centres, as well as a university.

Health and welfare. The initial stimulus for health services came from church missions and from industrial establishments catering to large numbers of employees and their dependents. They established both hospitals and rural clinics. There are also private medical practitioners in all the larger urban centres. Chief causes of illness are intestinal infections, tuberculosis, food deficiencies, and respiratory diseases. After its virtual elimination in the 1950s, malaria has again become a major disease, especially in the Lowveld, where there has been a large influx of infected immigrant labour from Mozambique. By 2000, Swaziland suffered from one of the highest infection rates of HIV in the world, with nearly one-fourth of the population being afflicted.

Cultural life. Tradition continues to play an important role in Swazi society, both at the national ceremonial level and in day-to-day personal contacts. This reflects the unity of the Swazi as one nation under a traditional leader and especially their reverence for the struggle of King Sobhuza II over the 61 years of his reign to regain their independence.

The Incwala and Umhlanga

The two main cultural events are the Incwala in December and the Umhlanga in August. The Incwala is sometimes described as a first-fruits ceremony, but, spread over six days, it is a much more complex ritual of renewing and strengthening the kingship and the nation, with songs and dances used only on this occasion. The Umhlanga, or Reed Dance, brings together the maidens of the country to cut reeds for the annual repairs to the windbreaks of the queen mother's village; it lasts for five days. It is also symbolic of the unity of the nation and of its perpetuation through the massed ranks of young women. Both ceremonies are held at the national capital of the queen mother.

Other ceremonies are associated with the communal weeding and harvesting of the king's fields (and those of the chiefs) and with customary marriages. Most ceremonies are accompanied by traditional music, songs, and dancing. Musical instruments are simple in design, a kudu horn (*impalampala*) used for hunting or herding cattle, a calabash attached to a bow (*umakweyane*) for love songs, the reed flute, played by small boys while herding, and rattles made of seedpods attached to the wrists and ankles. However, more typical of the homestead nowadays are the radio and record and tape players.

For statistical data on the land and people of Swaziland, see the *Britannica World Data* section in the BRITANNICA BOOK OF THE YEAR.

HISTORY

Early history. The Swazi nation is a relatively recent political grouping, the main amalgamation of clans having taken place under Dlamini military hegemony about the middle of the 19th century. However, the record of human settlement in what is now Swaziland stretches far back into prehistory. The earliest stone tools, found on ancient river terraces, date back more than 250,000 years, and later stone implements are associated with evidence of *Homo sapiens,* perhaps as long ago as 100,000 years. By 42,000 years ago the inhabitants were quarrying red and black hematite ore for cosmetic purposes on the top of the Ngwenya massif (where in 1964 a large opencut mining operation was developed to exploit the rich ore deposit). This ranks as one of the world's earliest known mining and trading activities, and mining continued for many thousands of years after that. Much later—about 20,000 years ago—the archaeological record reveals occupation by the ancestors of the San hunter-gatherers, who created the distinctive rock paintings found throughout the western part of the country.

About 2,000 years ago groups of Bantu-speaking peoples (Nguni, Sotho, and Tswana) moved southward across the Limpopo River. They cultivated crops, kept livestock (sheep and goats), used pottery, and smelted iron—hence their designation as Early Iron Age peoples. At a later date cattle were introduced. These people are recorded at Ngwenya, where the mining of iron ore has been dated to about AD 400. During the following centuries the more attractive areas of Swaziland were settled by these ancestors of the Nguni and Sotho clans, whom the Swazi encountered in the late 18th and early 19th centuries.

The ancestors of the Dlamini clan were part of this southward movement, which reached the Delagoa Bay area (now Maputo) of Mozambique some considerable time before the arrival of the Portuguese in the early 16th century. There they settled as part of the Thembe-Tonga group of peoples until the mid-18th century, when, probably because of dynastic conflict, they moved southward along the coastal plain between the mountains and the Indian Ocean, "scourging the Lubombo" as a royal praise song puts it. Up to this time they called themselves Emalangeni, after an ancestral Langa. Later they moved westward through the Lubombo range and up the Pongola valley, where in about 1770 under their king Ngwane III they established the first nucleus of the Swazi nation (bakaNgwane) near what is now Nhlangano.

Emergence of the Swazi nation. This was a turbulent period in the history of southeastern Africa, when a number of major clan groupings were struggling for supremacy. Two of these, the Ndwandwe and the Zulu, located to the south of the new Ngwane homeland, constituted a serious threat to the Dlamini, who strove to establish their control over the clans among whom they had settled. Nevertheless, by the end of the century, they had achieved considerable success in assimilating some of these clans and in forging bonds with others to create a new political grouping. However, this new power base was not strong enough to ward off aggression by their southern neighbours, so about 1820 under their new king—Sobhuza I, or Somhlohlo ("The Wonder")—they moved northward to establish a safer heartland in central Swaziland (the Middleveld). There the Dlamini consolidated their power under Sobhuza I and his son Mswati II. Part of this success must be attributed to Sobhuza's adoption of the Zulu age-group system of military organization, which created regiments across clan loyalties and was strictly disciplined. By 1860 they had extended their power through conquest and assimilation far beyond present-day Swaziland under Mswati II, whom later generations described as "their greatest fighting king" and who gave his name to the nation.

Consolidation of power

At the peak of their power, however, a new factor had emerged in the regional geopolitics, which over the next 40 years caused the gradual contraction of Swazi territorial and political authority. This was the expanding Boer republic of the Transvaal and the growing British imperial presence, especially after the discovery in South Africa of diamonds in 1867 and gold in 1871.

The main destabilizing force was the stream into the country of European prospectors and concession hunters, which the Swazi were able to contain for a while but which became a flood after the kingship passed to Mbandzeni in 1875. By 1890 so many concessions had been granted for so many purposes (in addition to land and mineral rights) that practically the whole country was covered two, three, or even four deep in concessions of all kinds and for different periods. Although the Swazi maintained that these were all leasehold rights that would terminate at some future date, they had, as it later transpired, signed away their independence.

The European presence

In 1888 the Swazi tried to regulate the new influences that the influx of Europeans had created by granting them a charter of conditional self-government subject to the royal veto. Behind the concessions scramble by individuals, however, lay the intrigue and conflict of the two white powers, the Boers and the British. The former needed a route to the sea, while the latter wanted to contain them. Swaziland stood in the way, as an obstacle to be manipulated by both.

In 1890, under a convention between the British government and the South African Republic, a provisional government consisting of representatives of the two powers and a representative of the Swazi people was set up. In 1893 the British government signed a new convention permitting the South African Republic to negotiate with the Swazi regent and her council for a proclamation allowing the republic to assume powers of jurisdiction, legislation, and administration without the incorporation of Swaziland into the republic. The Swazi refused to sign the proclamation, but in 1894 another convention was signed by the two powers, virtually giving unilateral effect to its terms. After the South African War of 1899–1902 all the rights and powers of the republic passed to Great Britain, and in June 1903, by an order in council under the Foreign Jurisdiction Act, the governor of the Transvaal was empowered to administer Swaziland and to legislate by proclamation. In 1906 these powers were transferred to a high commissioner for Basutoland, Bechuanaland, and Swaziland.

Colonial administration. The colonial years from 1906 to the late 1940s saw Swaziland drift into a backwater of the British Empire. A fundamental reason was that provision had been made in the South Africa Act of 1909 (which established the Union of South Africa as a British dominion) for the possible eventual transfer of Swaziland (and Basutoland and Bechuanaland) to the union. While this possibility existed, no socioeconomic improvement took place, and it was difficult to distinguish Swaziland from the neighbouring rural areas of South Africa. Politically, the situation was epitomized in the downgrading of the title of king to that of paramount chief and of his function to that of "native administration." Despite a number of requests from South Africa, however, the imperial power declined to transfer Swaziland. This resolution was stiffened by events in South Africa after the 1948 election, which heralded the onset of apartheid. Also, from 1945 onward, Britain had begun to tackle socioeconomic problems. By the mid-1950s the issue of transfer was dead, though the grand apartheid design of separate homelands for Africans still included Swaziland.

From 1960 the economy forged ahead steadily, but sociopolitical progress followed more slowly. A constitution providing for limited self-government was promulgated in 1963, and in 1967 the country became a protected state under which the kingship was restored. This was followed by full independence on Sept. 6, 1968. (Jo.R.M.)

Independence

Swaziland since independence. King Sobhuza II had been installed as the *ngwenyama* of the Swazi nation in 1921. After 1968 the governing system moved from being a constitutional monarchy to being directly controlled by the king. Five years after independence, Sobhuza repealed the constitution designed by the British and restored the traditional system of government, in which all effective power devolved to the royal capital. A system of local government, known as the *tinkhundla*, allowed traditional authorities to control the government at the local level. The king's concession to modern government was to retain the cabinet system with a prime minister and other ministers, although they were all chosen by the king. Under his rule, Swaziland enjoyed a remarkable degree of political stability and economic progress. Emphasis was placed on education—which had been neglected in colonial times—on health, and on other human-resource developments. A major concern, however, was a growing economic dependence on South Africa.

King Sobhuza II died on Aug. 21, 1982; his death was followed by a power struggle within the royal family that was not resolved until 1986, when the teenage heir, Prince Makhosetive, was installed as King Mswati III. Under his leadership, Swaziland continued to follow a traditional form of government, but throughout the 1990s opposition continued to grow. The king responded by saying he would give the people a greater voice in government, but he failed to provide much substance by the beginning of the 21st century. Political parties were still not allowed, and a promised new constitution failed to materialize. Swaziland's biggest 21st-century problem was the rising number of cases of AIDS. (Ed.)

For later developments in the history of Swaziland, see the BRITANNICA BOOK OF THE YEAR.

Zambia

Zambia is a landlocked republic in southern Africa with an area of 290,586 square miles (752,614 square kilometres). The capital is Lusaka. Zambia's population is highly urbanized, and large parts of the country are thinly populated. Population is concentrated in the "Line of Rail," the area served by the railway linking the Copperbelt with

Lusaka and the border town of Livingstone. Zambia has a long land border on the west with Angola but is divided from its neighbours to the south by the Zambezi River. To the southwest is the thin projection of Namibian territory known as the Caprivi Strip, at the eastern end of which four countries (Zambia, Namibia, Botswana, and Zimbabwe) appear to meet at a point—a "quadripoint"—although the precise nature of the meeting is contested. Man-made Lake Kariba now forms part of the river border with Zimbabwe. Mozambique is Zambia's neighbour to the southeast, Malaŵi to the east, and Tanzania to the northeast. The long border with Congo (Kinshasa) starts at Lake Tanganyika, crosses to Lake Mweru, and follows the Luapula River to the Pedicle, a wedge of Congolese territory that cuts deep into Zambia to give the country its distinctive butterfly shape. Westward from the Pedicle the frontier follows the Zambezi-Congo watershed to the Angolan border. The country's name is derived from the Zambezi River, which drains all but a small northern part of the country.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Most of Zambia forms part of the high plateau of this part of Africa (3,000 to 5,000 feet [900 to 1,500 metres] above sea level); major relief features occur where river valleys and rifted troughs, some lake-filled, dissect its surface. Lake Tanganyika lies some 2,000 feet below the plateau, and the largest rift, that containing the Luangwa River, is a serious barrier to communications. The highest elevations occur in the east, where the Nyika Plateau on the Malaŵian border is generally over 6,000 feet, rising to more than 7,000 feet in the Mafinga Hills. The general slope of the plateau is toward the southwest, although the drainage of the Zambezi turns eastward to the Indian Ocean. Over most of the country, ancient crystalline rocks are exposed, the product of prolonged erosion processes. In western Zambia they are overlain by younger sandy deposits, relict of a once more extensive Kalahari desert. In central and eastern parts of the country, downwarping of the plateau surface forms swamp- or lake-filled depressions (*e.g.,* Lake Bangweulu, the Lukanga Swamp); in more elevated regions, ridges and isolated hills made up of more resistant rocks punctuate otherwise smooth skylines.

Highlands and rifts

Drainage. The continental divide—between the Congo River drainage, which flows to the Atlantic, and that of the Zambezi, which drains into the Indian Ocean—runs along the Zambia-Congo (Kinshasa) border west of the Pedicle and then northeastward to the border with Tanzania. Both the Luapula (which drains the Bangweulu basin into Lake Mweru) and Lake Tanganyika are tributary to the Congo. The rest of the country lies within the Zambezi basin, the river itself rising in northwestern Zambia and circling through Angola before traversing the sandy plains of western Zambia. At the Victoria Falls it drops 300 feet into a milewide chasm at the head of the gorge leading down to Lake Kariba and the troughlike middle part of its valley. It has two main tributaries in Zambia. Rising on the Copperbelt, the Kafue River drains the Lukanga Swamp and Kafue Flats before an abrupt descent to the Zambezi. The Luangwa River, mostly confined within its rift trough, is quite different. The Bangweulu Swamps and the Kafue Flats are wetlands of international importance.

Geology and soils. The oldest rocks of the country are volcanics and granites of the Bangweulu block in the northeast. These are 2.5 billion years and older and have been unaffected by orogenic processes since Precambrian times. This old structure is partly covered by ancient sedimentary rocks, and together they constitute the basement complex. Sedimentaries of the Katangan System (550 to 620 million years old) are extensive in the central areas, and mineralization of these rocks is the basis of Zambia's mining industry. Later sedimentary rocks of the Karroo (Karoo) System filled rifted troughs in the plateau surface, some of which, as in the Luangwa and middle Zambezi valleys, have been partially re-excavated. Coal seams occur in Karroo rocks to the north of Lake Kariba. These structural troughs are ancient features. Younger rifts in the north, part of the East African Rift System, are occupied by Lakes Mweru and Tanganyika. Karroo and older sedimentaries are also found in the west, buried under the predominantly sandy deposits of the Kalahari System.

The soils of the plateau are generally of poor quality, long-continued weathering and erosion having leached many of their nutrients. Much of the plateau is covered by the so-called Sandveld soils, which have a sandy surface layer overlying a clayey subsoil, often with laterite (an iron-rich horizon). Shifting cultivation is widespread, and for more permanent cultivation soils need to be carefully managed. More fertile red clay soils occur over limestone and basic rocks and have attracted commercial farming. Soils of the Kalahari Sands have little agricultural potential and are mainly under woodland. The black clay soils of some floodplains and swamp areas are highly fertile but difficult to cultivate, being waterlogged in the rainy season and rock-hard when dry.

Sandveld soils

Climate. Although Zambia lies within the tropics, its climate is modified by the elevation of the country and is generally favourable to human settlement and comfort. The marked seasonal pattern of rainfall is caused by the north and south movement of the intertropical convergence zone (ITCZ), following the apparent movement of the Sun. In January the ITCZ is in its southernmost position, and the rainy season is at its peak; by June it has moved north, and the weather is dry. Summer rains reduce the high temperatures that might be expected at this time.

Rainfall (concentrated in just five months) is highest over the Bangweulu basin (more than 60 inches [1,500 millimetres] annually) and along the Congo-Zambezi watershed, declining southward to the middle Zambezi valley, which averages less than 28 inches. The Luangwa valley is also drier than the surrounding plateau. Rainfall is less reliable in the drier regions, and failure of the rains in the south and southwest periodically brings famine to these areas.

Temperature is modified by elevation, mean daily maximum temperatures higher than 100° F (38° C) occurring only in the Luangwa valley and the southwest. The coolest area is the high Nyika plateau on the border with Malaŵi. During the cold months (June and July), the area west of the Line of Rail is coolest, with mean minimum temperatures mostly under 45° F (7° C). Sesheke, in the southwest, has frost on an average of 10 days per year.

Average annual hours of sunshine range from more than 3,000 in the southwest to less than 2,600 on the eastern border. Winds are predominantly easterly-southeasterly, although in the rainy season winds blow from the northwest and north. Wind speeds are rarely strong enough to cause damage.

Although the major contrast is between the rainy season and the drier months, three seasons may be identified.

Three seasons

The warm wet season lasts from November until April. The movement into Zambia of the moist Congo air mass from the northwest heralds the start of the rains, in the north usually in early November and toward the end of the month around Lusaka. The change from dry to wet conditions is transitional rather than abrupt. December and January are the wettest months. Cloud cover lowers maximum temperatures but also limits radiative heat loss at night, so that minimum temperatures are kept relatively high. Relative humidity values are high, typically 95 percent in early morning but declining to 60–70 percent by midafternoon. Sunshine is surprisingly frequent, Lusaka averaging six hours of sunshine per day in January. Rainfall declines rapidly in April with the northward movement of the ITCZ.

The cool dry season lasts from April until August. The sun is overhead in the Northern Hemisphere, so temperatures are low; July is usually the coolest month. Clear skies allow maximum radiation and result in especially low temperatures on calm nights, with occasional ground frost occurring in sheltered valleys.

The hot dry season lasts from August until November. This is a period of rapidly rising temperatures; just two months separate July, the coldest month, and October, usually the hottest (although if the rains are delayed November can be hotter). Usually by mid-October cooler oceanic air moves in, leading to increasing humidity and cloud formation. High temperatures and increasing hu-

midity make this one of the least comfortable times of the year, although the first rains wash away dry-season dust.

Plant and animal life. On the plateau, miombo woodland is characteristic: a semicontinuous tree cover dominated by small leguminous trees of the *Brachystegia* and *Julbernardia* genera but with a significant grassy undergrowth. Burning of the grasses in the dry season causes the trees to develop a corky, fire-resistant bark. Mopane woodland, in which *Colophospermum mopane* dominates but in which the baobab is distinctive, occurs in the drier and hotter valleys of the Zambezi in the south and in the Luangwa valley. Zambezi teak (*Baikiea plurijuga*) occurs in the southern fringe of the area covered by the Kalahari Sands. Mukwa (*Pterocarpus angolensis*), a good furniture timber, is found in the Lake Bangweulu area. More than 8 percent of the country has been set aside as forest reserve or protected forest areas.

Where there is seasonal flooding—in swamps and on floodplains, notably in the Bangweulu and Lukanga regions, in the upper Zambezi, and on the Kafue Flats—open grasslands are characteristic. On the plateau the tree cover is broken by grass-covered *dambos:* shallow saucer-shaped valleys, often lacking a surface watercourse.

The variety of Zambia's mammals is notable, and there are large concentrations on the major floodplains, particularly in the national parks of the Luangwa and Kafue valleys. Depletion of wildlife has occurred because of the spread of human activities outside the parks, while poaching is a serious threat within. The illegal trade in rhino horn has been responsible for the virtual elimination of the rhinocerous from Zambia, and poaching of elephants for their tusks has greatly reduced their numbers, despite government measures against it. There are a large range of smaller mammals and varied and numerous birdlife. The fish eagle, Zambia's national emblem, is common on large stretches of open water.

Reptiles include crocodiles, tortoises, terrapins, a variety of lizards, and many poisonous and nonpoisonous snakes. Insects of most orders are prevalent. Termite mounds, often large and sometimes pinnacled, are a landscape feature of some areas and can hinder farming operations.

Wildlife is protected in 19 official national parks and 34 game-management areas, which together constitute more than one-third of the country. Eight national parks have tourist facilities: South and North Luangwa, Kafue, Lochinvar, Blue Lagoon, Sumbu, Nyika, and Mosi-oa-Tunya. Kafue, the oldest and largest of these parks (8,650 square miles), is on the plateau and has generally low game concentrations, although it is noted for the variety of species of antelope it hosts. Lake Itezhi-Tezhi, a reservoir behind a regulating dam on the Kafue, has flooded part of the park. South Luangwa (3,500 square miles) has one of Africa's largest (but declining) elephant concentrations. North Luangwa, a park only recently made accessible to tourists, offers true wilderness adventure: walking safaris. Thornicroft's giraffe is unique to the Luangwa valley. The other parks are much smaller. Lochinvar, on the Kafue Flats, is of particular interest to bird-watchers, with more than 400 species recorded. The Kafue lechwe, a type of aquatic antelope, is unique to the flats. The Mosi-oa-Tunya National Park protects the environs of the Victoria Falls. Nyika National Park was established to preserve remnant patches of montane forest. Sumbu, on the shores of Lake Tanganyika, is renowned for easy sightings of the rare sitatunga.

National parks

The people. *Ethnic and linguistic composition.* Relative to the country's area, Zambia's population is small (although, with a growth rate of more than 3 percent per annum, increasing rapidly). It is highly urbanized, with well over half the population living in the four provinces along the Line of Rail. The movement of people from the rural areas into the towns was particularly marked after independence. Government efforts to reverse the flow have had only limited success.

Most Zambians speak Bantu languages and are descended from farming and metal-using peoples who settled in the region over the past 2,000 years. Cultural traditions in the northeast and northwest indicate influences and migrations from the upper Congo basin. There are also some descendants of hunters and gatherers who seem to have been pushed back into the Kalahari, the Bangweulu and Lukanga swamps, and the Kafue Flats. In the 19th century invaders arrived from the south: Ngoni settled in the east, while the Kololo briefly ruled the Lozi in the upper Zambezi valley. Europeans began to enter in significant numbers in the late 19th century.

Although most Zambians are of Bantu origin, the complex patterns of immigration have produced wide linguistic and cultural variety. Eighty different languages or dialects have been identified in Zambia; they can usefully be considered as comprising 14 groups, of which the Bemba group is the most widespread, accounting for more than one-third of the population. Second in importance is the Nyanja group (about 17 percent), while the Tonga group is about 15 percent.

The non-African population tends to be located in the towns, although the commercial farming community, found mainly in the central and southern regions, includes Europeans and whites from South Africa, some holding Zambian citizenship. Many Europeans left at indepen-

A Thornicroft's giraffe in the mopane woodland of the Luangwa valley (North Luangwa National Park), eastern Zambia.

dence, and their numbers have steadily declined, partly owing to regulations that restrict the employment and residence of nonnationals.

By contrast, the number of Asians has risen since independence. The majority are engaged in the retail trade, and they also are concentrated in the major towns, because in 1970 non-Zambians were prohibited from trading in rural areas. Most are Indians, mainly Gujarātī speakers from western India.

Ethnic distribution

There is some relationship between the distribution of major tribal groups and the administrative division of the country into provinces. The Western (formerly Barotse) Province is dominated by the Lozi, who live on and about the floodplain of the upper Zambezi. Lozi society is markedly centralized under the leadership of a king, the *litunga,* and at one time nurtured separatist aspirations.

In the North-Western Province, adjoining the Angolan and Zairean borders, there is no single dominant group; the peoples here include the southern Lunda and the Luvale, Chokwe, Luchazi, Mbunda, Ndembu, and Kaonde.

The Southern Province contains the Ila-Tonga peoples, of which 12 separate groups can be identified, speaking closely related dialects. Settlement is characterized by dispersed homesteads, and there are no chiefs. Traditionally cattle-owning, they occupy an area of above-average soil fertility through which the railway was built, encouraging early involvement in commercial agriculture. Migration to urban areas is of lesser importance there than elsewhere.

The Northern Province is dominated by the Bemba, who formed an extensive kingdom in the 19th century. The province was a major source of mine labour, and Bemba has become the lingua franca of the Copperbelt as well as the most widely spoken language in the country. Most languages in the northeast of the province are closely related to languages in Tanzania and Malaŵi.

Luapula Province extends along the river of that name from Lake Bangweulu to Lake Mweru and is inhabited by a number of Bemba-speaking but culturally distinct peoples (among them the Lunda, Kabende, Aushi, and Chishinga). Fishing is the major economic activity. In the 19th century the valley was dominated by the Lunda kingdom of Kazembe.

The Eastern Province is the home of the Nsenga, Chewa, Kunda, and Ngoni. The last invaded from the south during the 19th century but took the language of the peoples that they raided. The dominant language is Nyanja, which is also spoken in Malaŵi and is the lingua franca in Lusaka, to which many migrants from this area have moved.

The ethnic boundary between the Ila-Tonga and the Lala-Lamba groups runs approximately through the Central Province, with the Lenje-Soli peoples occupying a buffer area between the two. The Lenje are related to the Ila-Tonga, and the Soli to the Lala-Lamba, who, in turn, are connected with the Kaonde of the North-Western Province.

The Copperbelt (formerly the Western) Province is the location of the mining industry. The population is composed of people from all parts of Zambia, as well as some from neighbouring countries. This is true also of Lusaka Province, a small province created around the capital from the southern part of Central Province in 1976.

There are seven official vernacular languages: Bemba, Nyanja, Lozi, Tonga, Luvale, Lunda, and Kaonde, the latter three being languages of the North-Western Province. English is the official language of government.

Dominance of Christianity

Religion. Zambia is predominantly a Christian country, although few have totally abandoned all aspects of traditional belief systems. The first Christian missions arrived before colonial rule, and the growth of adherents was greatly assisted by the schools that they established. The Roman Catholic church is today the largest single denomination, but Anglicans, Baptists, Methodists, and others are well established. The growth of fundamentalist churches has been particularly noticeable since independence, and the government of the newly independent country soon ran into conflict with two of these, the Jehovah's Witnesses and the Lumpa church. The Asian community is predominantly Hindu, the rest mainly Muslim. There are relatively few Muslims in the African population.

The economy. Zambia's economy is heavily dependent on mining, in particular the mining of copper. Unfortunately, reserves of copper ore at some mines are becoming depleted, costs of production have increased, and the price of copper on the world market has slumped. There is thus a great need to broaden the base of the economy. Agriculture is relatively poorly developed, however, and major investment in manufacturing industry did not take place until after independence. State involvement in all aspects of the economy has been a feature of independent Zambia and has created a highly centralized and bureaucratic economic structure, although changes in the political structure of the country in the early 1990s were accompanied by efforts to increase private investment and involvement, particularly in the industrial sector.

Shortly after independence, Zambia embarked on a program of national development planning, the Transitional Development Plan, preceding the First National Development Plan of 1966–71. This later plan, which provided for major investment in infrastructure and manufacturing, was largely implemented and generally successful (which was not true of subsequent plans).

Post-independence restructuring

A major switch in the structure of the country's economy came with the Mulungushi Reforms of April 1968, in which the government declared its intention to acquire an equity holding (usually 51 percent or more) in a number of key foreign-owned firms, to be controlled by the Industrial Development Corporation (INDECO). By January 1970 a majority holding had been acquired in the Zambian operations of the two major foreign mining corporations, the Anglo American Corporation and the Rhodesia Selection Trust (RST), which became the Nchanga Consolidated Copper Mines (NCCM) and Roan Consolidated Mines (RCM), respectively. A new parastatal body, the Mining Development Corporation (MINDECO), was created. Government control was later extended to insurance companies and building societies, which were placed within a new parastatal body, the Finance and Development Corporation (FINDECO). The banks successfully resisted takeover. INDECO, MINDECO, and FINDECO were brought together in 1971 under an omnibus parastatal, the Zambia Industrial and Mining Corporation (ZIMCO), to create one of the largest companies in sub-Saharan Africa. In 1973 management contracts under which the day-to-day operations of the mines had been carried out by Anglo American and RST were ended. In 1982 NCCM and RCM were merged into the giant Zambia Consolidated Copper Mines Ltd. (ZCCM).

Programs of nationalization, particularly of the mining industry, were ill-timed. The massive increase in the price of oil in 1973 (which greatly inflated the import bill) was followed by a slump in copper prices in 1975 and a diminution of export earnings. The price of copper, which in 1973 accounted for 95 percent of all export earnings, halved in value on the world market in 1975. By 1976 there was a balance-of-payments crisis, and the country became massively indebted to the International Monetary Fund (IMF). There was little hope of putting the proposals of the Third National Development Plan (1978–83) into effect: crisis management, not long-term planning, was the reality.

By the mid-1980s Zambia had become one of the most indebted nations in the world relative to its gross domestic product (GDP). As the price for its continuing support, the IMF was able to insist that the Zambian government introduce programs aimed at stabilizing the economy and restructuring to reduce dependence on copper. Measures included ending price controls, currency devaluation, reductions in government expenditure, the ending of subsidies on food and fertilizer, and increased prices for farm produce. The removal of food subsidies caused massive increases in the price of basic foodstuffs and led to rioting. Unable to cope with internal opposition to the new policies, Zambia broke with the IMF in May 1987, introducing its own New Economic Recovery Programme in 1988; it subsequently moved toward a new understanding with the IMF in 1989. In a major policy turnabout in 1990, reflecting events in eastern Europe and the Soviet Union, the intention to partially privatize the parastatals

was announced. The new government of the Movement for Multiparty Democracy, which came into power in November 1991, promised to liberate the economy and introduce a free-market system.

The union movement, especially among the mine workers, has been a strong influence on political development since the 1930s, and President Frederick Chiluba, who succeeded the country's first president, Kenneth Kaunda, in 1991, had been leader of the trade union movement.

Copper and other minerals

Resources. Copper, the basis of Zambia's prosperity in the first decade of independence, is a declining asset. Alternatives such as optical glass fibre have reduced market demand, and exhaustion of reserves in existing mining areas has led to increased costs. Large-scale mining could end by 2005, although small-scale operations will continue long after that. Cobalt occurs in association with copper. Lead and zinc mining at Kabwe began in 1906, predating the large-scale mining of copper. Underground mining at Kabwe has practically ended, although reworking of mine dumps has prolonged activity at the mine.

Other minerals worked in Zambia include gold and silver, both of which occur in association with copper. Iron ore is found near Mumbwa. There is an increasing awareness of the value of Zambia's gemstones. Emeralds, mined near Luanshya and Ndola, are cut and polished locally. Amethyst, aquamarine, and tourmaline are also mined. Large deposits of cosmetic-grade talc are found near Ndola and Lusaka. Limestone is widely found on the Copperbelt and in the Lusaka district and is quarried for stone, lime, and cement; associated with it are workable occurrences of marble.

The country once relied on coal carried by rail from Hwange in what is now Zimbabwe, but, following Rhodesia's Unilateral Declaration of Independence (UDI) in 1965, relatively poor-grade coal deposits were developed at Maamba in the Gwembe area, adjacent to Lake Kariba. Although there has been extensive prospecting for oil in the Karroo sediments of the middle Zambezi, the Luangwa, and the southwest, the search has so far been unsuccessful. Nor has prospecting for uranium discovered workable quantities of the ore.

Hydropower

There is, however, one rich energy source: hydropower. Large rivers descending from the plateau into the rifted troughs of the Zambezi provide scope for hydropower development, and a major gorge on the middle Zambezi enabled it to be dammed to form Lake Kariba, the world's largest man-made lake of its time. The first power station at Kariba was built on the south side of the river, but a 600-megawatt station on the Zambian side was completed in 1977, shortly after the completion of a 900-megawatt station in the Kafue Gorge, south of Lusaka. There is an earlier power station at the Victoria Falls. Another dam on the Zambezi, which would need the collaboration of Zimbabwe, is projected at Batoka Gorge. Electricity distribution from Kariba extends north to the Copperbelt and southward across Zimbabwe. There are also links with Zaire and peripheral areas of Botswana and Namibia.

Agriculture, forestry, and fishing. Although contributing less than 15 percent of GDP, agriculture employs about 70 percent of the economically active population. Levels of commercialization are relatively low, and near-subsistence farming is widespread. Most agricultural produce is consumed within Zambia. A major objective of government policy is the expansion and diversification of the agricultural sector to take up the slack caused by the contraction of the mining industry. It would also contribute to lessening and perhaps reversing the rural-to-urban migration. For many years producer prices were kept low, farm incomes being depressed in favour of keeping living costs low in the towns. Increased producer prices have resulted in considerable urban unrest.

For many years the growth of maize (corn) was promoted by the use of hybrid varieties and subsidized fertilizers. It began to displace staples such as cassava, sorghum, and millet in areas not naturally suited to it (*e.g.*, higher-rainfall areas of the north). The removal of fertilizer subsidies reversed that trend; in the north, cassava, the traditional staple, is regaining importance. Where conditions are favourable and there is good access to the markets, however, improved producer prices encourage the expansion of corn cultivation. Other crops include sorghum, bulrush millet, and finger millet. Sorghum is widespread in the middle Zambezi and west of the Copperbelt. Finger millet is essentially a crop of the northeast, whereas bulrush millet is extensive in the west and along the middle Zambezi. Of the leguminous crops, groundnuts (peanuts) are most widespread, especially in the eastern part of the country and in the sandy areas of the west. Secondary food crops include sweet potatoes, taro, yams, peas, beans, pumpkins, sugarcane, bananas, rice, and a variety of other fruits and vegetables.

Cultivation methods

On the poorer soils of the wetter north and northeast, cultivation is mainly of a shifting variety called *chitemene*, whereby trees (or their branches) are cut and then piled in the centre of the clearing for burning, the crop being planted in the ashes. Over much of the rest of the country, semipermanent hoe cultivation predominates; in swamp and lakeshore areas, it is combined with fishing. Oxen are used on the sandy soils of the west.

Large-scale commercial farming has restricted distribution, mainly along the Line of Rail (notably on the Tonga plateau in the south, near Lusaka and Kabwe, on the Copperbelt, and near Mkushi) but also in the Chipata area and around Mbala at the southern end of Lake Tanganyika. At independence almost all of the 1,200 commercial farmers were of European or South African origin, but about half left in the years immediately following. Many farms were taken over by the state, but state farms have not been a success. Some were taken over, not always successfully, by industrial companies that were encouraged to invest in agriculture. The main crop is maize. Virginia tobacco has lost some of its popularity, although smaller growers have been encouraged to produce it. There has been increasing export by air of horticultural produce to European markets.

Irrigated agriculture is increasingly important. Started in 1966, the first successful scheme was at Nakambala on the south side of the Kafue Flats, where the Zambia Sugar Company has more than 25,000 acres under sugarcane. Their refinery also serves nearby smallholder cane-growing projects. Zambia provides for its own needs and exports sugar. At Mpongwe, south of Luanshya, a major irrigation scheme produces wheat and coffee. Kasama in the northeast is the location of two other arabica coffee schemes, and there is a tea estate at Kawambwa in the far north. Wheat and cotton are produced at Sinazongwe and Sinazeze in the Gwembe (middle Zambezi) valley, using water from Lake Kariba. Cotton cultivation was encouraged by the construction of textile mills, first at Kafue, later at Kabwe.

Cattle are found only in the drier, tsetse-free parts of the country with open woodland vegetation: mainly the Tonga plateau, the Kafue Flats, and the floodplain of the upper Zambezi (tsetse flies are prevalent along much of the middle Zambezi). Cattle that form part of traditional farming systems often do not enter the commercial market, which is supplied mainly by larger herds kept on commercial farms, especially near Lusaka and in the south.

Soil erosion is a perennial concern in the heavily settled areas of the south and east, while the middle Zambezi valley and the southwest are worst affected in drought years.

Forest reserves and timbering

Some 26,000 square miles of Zambia are classified as forest reserves, although the greater part of the country is wooded but not protected in this way. The main commercial timber areas are on the Copperbelt, where there have been plantings of exotic softwoods to supply the needs of the mining industry, and in the southwest, where there are extensive areas of Zambezi teak. A mill at Mulobezi, which supplies timber products, is linked to Livingstone by a light railway. A major concern is forest destruction due to charcoal burning; in the towns, charcoal is the most popular cooking fuel. The government has supported attempts to introduce energy-efficient charcoal stoves.

Zambia has relatively rich fisheries based on its many lakes, swamps, and seasonally inundated floodplains. Of particular importance is the Luapula valley, which supplies the Copperbelt. Lake Tanganyika is famous for Nile perch and kapenta, a freshwater sardine. Lusaka is supplied

mainly from the Kafue Flats and the Lukanga Swamp. Of lesser importance is the fishery on the upper Zambezi. There has been a revival of fishing on Lake Kariba, interrupted by the conflict with Rhodesia during the 1970s. There is a fishery of kapenta (a deep-feeding species caught at night using special lamps to direct their movements), which had been introduced successfully from Lake Tanganyika, although the fishery is better established in Zimbabwe, where fishing was not stopped by the war. Most fish is smoked before being trucked to market.

The Copperbelt

Industry. The Copperbelt is the country's industrial heart, the focus of mining and ancilliary industries. Local people have worked the ores for many centuries, but commercial mining essentially dates back to the 1920s. The ores occur at depth in a synclinal structure so that deep-shaft mining is normal, although there has been some opencut mining. Exhaustion of reserves and the increasing costs of mining led to the closure of the Kansanshi and Chambishi mines in the mid-1980s, and rationalization of operations in an attempt to contain costs has closed down some refining and ancilliary plants. There is much mining-related industrial activity on the Copperbelt, and a major downturn in mining activity would have severe repercussions for the area as a whole. The other major mining centre is at Kabwe, where the lead and zinc mine has been virtually exhausted. Mining elsewhere, with the exception of coal at Maambwe, is mainly small-scale.

Manufacturing industry was poorly developed before independence, most investment in this sector during the federal period being made in what is now Zimbabwe. However, during the First National Development Plan major investment was made in manufacturing, particularly import substitution. Major plants under the ZIMCO umbrella produce fertilizers, explosives, tires, hessian and grain bags, textiles, glass, cement, batteries, and foodstuffs (brewing and corn-milling being especially important). Automobiles are assembled at Livingstone.

Tourism is based mainly on game viewing and the Victoria Falls (which also offers white-water rafting in the gorges below). Although appealing to a limited market, hunting safaris are a major source of income. Tourism promotion is coordinated by the Ministry of Tourism and the National Tourist Board. Development has been handicapped by the limited number of hotel beds, poor communications, and the few alternative attractions.

Transportation. As a landlocked country, Zambia is reliant on neighbouring countries for access to the sea, and civil strife in three of these has closed key routes to the coast for much of the period since independence. At

Rail lines

that time most imports and exports were handled by the railway that linked the country with the ports of South Africa and Mozambique via Rhodesia. The 3-foot-6-inch-(1,065-millimetre-) gauge line crossed the Zambezi at the Victoria Falls in 1905, reaching the Copperbelt in 1909. To the north it was linked with the Benguela Railway in 1931, giving access to the Angolan port of Lobito.

After the Rhodesian UDI, in accordance with the sanctions policy of the United Nations, Zambia took measures to reduce its dependence on routes to the south. Much traffic was diverted to the Benguela Railway before civil war in Angola closed that route, and a project to link Zambia with the Tanzanian port of Dar es Salaam was revived. Failing to obtain Western support, the two countries turned to China for help to build the 1,060-mile Tan-Zam railway, completed in 1976. Unfortunately, the railway, which links with the older railway at Kapiri Mposhi, has not carried the projected volume of traffic, owing partly to congestion at the port of Dar es Salaam and partly to problems with track and rolling stock.

Political changes in southern Africa have lessened the need to use northern routes. South African ports are being used more, and copper can also be trucked through Namibia's Caprivi Strip and by rail from Grootfontein to Walvis Bay.

Much was done to improve the road system. The Great North Road was tarred to the Tanzanian border at Tunduma, and the Great East Road to Chipata and the Malaŵian border. Malaŵi has since extended its railway from the capital, Lilongwe, to the Zambian border at Mchinji, but Zambia has not built the 26-mile link with Chipata. Upstream of the Victoria Falls the Zambezi is unbridged, and roads on the Kalahari Sands are especially difficult.

An eight-inch petroleum pipeline from Dar es Salaam to Zambia's Indeni refinery in Ndola was completed in 1968.

Zambia's large rivers are relatively little used for transportation because of the presence of rapids and waterfalls and marked seasonal flow variations. Local transport is important on lakes. Mpulungu, a small port on the southern end of Lake Tanganyika, handles minor amounts of traffic bound for Rwanda and Burundi and links with the East African rail system.

Zambian Airways Corporation operates domestic and international services. Scheduled internal service by other operators was first allowed in 1990. The main airports are at Lusaka, Ndola, and Livingstone, but there are 12 secondary and 31 minor airports, in addition to private airstrips.

Administration and social conditions. *Government.* Zambia's initial constitution was abandoned in August 1973 when it became a one-party state. The constitution of the Second Republic provided for a "one-party participatory democracy," with the United National Independence Party (UNIP) the only legal political party. In response to mounting pressures within the country, the constitution was changed in 1991 to allow the reintroduction of a multiparty system.

Structure of the central government

Under the terms of the new constitution, the president, who is head of state and commander in chief of the armed forces, is elected by universal adult suffrage to a five-year term of office. He is empowered to appoint the vice president, the chief justice, and members of the High Court on the advice of the Judicial Services Commission. During the president's absence, his duties are assumed by the vice president. The president also appoints a cabinet from elected members of the National Assembly. The cabinet consists of 25 ministers, 30 deputy ministers (some ministries have 2), and 9 provincial deputy ministers.

The legislature, called the National Assembly, has 150 members, and elections to it are held every five years. Members of Parliament (as members of the National Assembly are usually called) are elected by universal adult suffrage. There is a 27-member House of Chiefs, with a two-year-term rotating membership. It has no legislative function: it may consider bills but not block their passage.

Central government is represented throughout Zambia by the provincial government system, by which resident ministers are appointed by the president to each of the nine provinces (including Lusaka Province, created 1976). Each minister is the president's direct representative and responsible for the coordination of policy and for liaison with district councils.

The nine provinces are divided into 55 districts, each of which has a district council chairman responsible to the provincial deputy minister; the district council chairman is particularly concerned with political and economic developments. His civil service counterpart is the district executive secretary. The cities of Lusaka, Ndola, and Kitwe have councils and mayors, but the formerly separate management of mine townships on the Copperbelt has been abolished.

Justice. The court system consists of the Supreme Court, the High Court, subordinate magistrate's courts, and local courts. Because the law administered by all except the local courts is based on English common law, decisions of the higher British courts are of persuasive value; in fact, a few statutes of the British Parliament that were declared by ordinance (decree) to apply to Zambia are in force so far as circumstances permit. Most of the laws presently on the statute book, however, have been locally enacted by ordinance or, since independence, by Zambian acts.

The Supreme Court consists of the chief justice and four other justices; it is the court of last resort. The High Court, presided over by a chief justice, has 12 puisne judges and is basically an appellate court. There are three classes of magistrate's courts, with progressive degrees of criminal and civil jurisdiction. Local courts consist of a president sitting alone or with other members, all appointed by the

Judicial Services Commission. Jurisdiction is conferred by the minister of justice and may encompass any written law, but punishment powers are limited. Local courts also deal with civil cases of a customary nature. Customary law is followed when it is not repugnant to justice or equity and when it is not incompatible with other legislation.

Independence of the judiciary

The judiciary remains formally independent, and in this respect Zambia contrasts favourably with many other African countries. The president appoints the chief justice and, on the advice of the Judicial Services Commission, also appoints other judges; however, the constitution severely restricts the president's powers of dismissal, and on occasion judges have not shrunk from challenging the authority of the government or party. At the same time, the scope of the judiciary was seriously limited by presidential powers of preventive detention under emergency regulations brought in at the time of Rhodesian UDI in November 1965 and subsequently regularly renewed by the National Assembly. The ending of these state-of-emergency regulations on Nov. 8, 1991, was one of the first acts of the new government.

Education. At independence Zambia had one of the most poorly developed education systems of Britain's former colonies, with just 109 university graduates and less than 0.5 percent of the population estimated to have completed primary education. The country has since invested heavily in education at all levels, and well over 90 percent of children in the 7–13 age group attend school. However, of those who enroll for the seven years of primary education, less than 20 percent enter secondary school, and only 2 percent of the 20–24 age group enter university or some other form of higher education.

The University of Zambia was opened in Lusaka in 1966, graduating its first students in 1969. In 1979 legislation was passed creating a federal university; a second campus was established at the Zambia Institute of Technology at Kitwe. In 1988 the federal structure was abandoned, and Zambia now has two universities: the University of Zambia at Lusaka and the Copperbelt University at Kitwe. The former offers courses in agriculture, education, engineering, humanities and social sciences, law, medicine, mining, natural sciences, and veterinary medicine, but only business and industrial studies and environmental studies are available at Kitwe. The basic program is four years, although engineering and medical courses are of five and seven years' duration, respectively.

Other tertiary-level institutions are vocationally focused and include the Evelyn Hone College of Applied Arts and Commerce and the Natural Resources Development College, both in Lusaka, as well as teacher-training colleges.

Early developments in continuing education have been undermined owing to underfunding. A 1976 initiative to introduce a major reform of the educational system was thwarted by the economic downturn, and underfunding is lowering the quality of education.

Effects of AIDS

Health and welfare. The ailing economy in the 1980s adversely affected the quality of health care available to the population at the time that AIDS (acquired immune deficiency syndrome) was beginning to have a major impact. Zambia is one of the southern African countries most severely affected by AIDS, with an estimated 20 percent of the urban population HIV-positive. Early deaths from AIDS-related illnesses are depriving the country of expensively trained skilled professionals and creating a growing number of orphaned children. Malnutrition, caused by poverty, is widespread, particularly in the rural areas, and is a major cause of death among children. The most prevalent tropical diseases are malaria, schistosomiasis (bilharziasis), and parasitic infections such as hookworm and leprosy. Leprosy has been contained, and leprosariums have given way to outpatient treatment. Malaria is increasing in the urban areas as programs to control the anopheles mosquito that spreads the disease have largely broken down. Schistosomiasis, a debilitating disease spread by waterborne snails, is widely found in riverine areas. Sleeping sickness, spread by the tsetse fly, is prevalent in the more sparsely populated tsetse-infected areas. Smallpox and typhoid fever have been successfully controlled through immunization programs. By contrast, there have been major outbreaks of cholera and dysentery in Lusaka and the Copperbelt, undoubtedly associated with increasing poverty and deficiencies in sanitation and community health programs. Blindness is a particular problem in the Luapula valley.

Tuberculosis and meningitis, related to AIDS, are now major causes of adult and infant mortality. Other common causes of death are respiratory infections, accidents and injuries (relative to the number of vehicles, the number of motor vehicle accidents is exceptionally high), and gastrointestinal disorders. Measles is a common cause of death in children. Death from heart disease is rising among the more affluent.

In the years following independence, considerable investment was made in the hospital system, which includes 12 general hospitals in the main towns, many smaller hospitals (some of which are mission-run), and rural health centres. The University Teaching Hospital in Lusaka is used by the medical school of the University of Zambia, which graduated its first doctors in 1972. A government Flying Doctor Service provides medical services in remote rural areas. Psychiatric services are based at the Chainama Hills Hospital in Lusaka, to which are linked small psychiatric units in other centres. There is a specialist pediatric hospital in Ndola. Despite local training, Zambia suffers from a shortage of doctors and other specialist staff. This is particularly true of the rural areas, although there are some excellent mission hospitals. There is a widespread belief in alternative medicine, including reliance upon traditional healers and witchcraft.

Social services

In traditional Zambian society, kinship groups care for the well-being of their members. In the towns, however, family ties have weakened, necessitating the development of government welfare services concerned with juvenile delinquency, adoption, and the care of the aged, indigent, and handicapped. Voluntary agencies, many drawing upon funds from outside Zambia, make a major contribution to the care of the less fortunate in society. The contributory National Provident Fund provides retirement benefits for those in paid employment (a minority of the labour force, including many town dwellers, are engaged in informal employment). Refugees have been a major problem, notably those fleeing conflicts in Angola and Mozambique, and the country once gave haven to many who had fled from Rhodesia during UDI and from South Africa.

Housing is a problem in the urban areas owing to the high level of rural-to-urban migration. Public housing could be made available only to a few, and shanty compounds sprang up to house the majority. "Site and service schemes" designate areas for self-help housing and provide basic services such as roads and water. In Lusaka the World Bank assisted with major schemes to upgrade existing squatter areas. Nevertheless, there is a sharp contrast between the spacious bungalows in the leafy suburbs, many built for Europeans before independence but now occupied by wealthy Zambians, and the cement-block and tin-roofed houses of the dusty and crowded townships.

Cultural life. Traditional Zambian art consists chiefly of wood carving, pottery making, and basket weaving. Among musical instruments, drums are the most widely used, but there also are stringed bows, flutes, horns and pipes, xylophones, bells, rattles, and the kalimba, or "African piano," made of strips of steel attached to a small board and vibrated by the fingers. Music, dancing, and song are used in tribal rituals and celebrations, as well as for entertainment, varying in form among ethnic groups. With the object of preserving cultural diversity, a government initiative in the 1980s led to the revival of many traditional ceremonies. Some, such as the *kuomboka* of the Lozi, survived essentially unchanged; others have taken up new forms. The National Dance Troupe performs the traditional dances of many groups. There is a national museum at Livingstone and another on the Copperbelt. The Moto-Moto Museum at Mbala focuses on the traditions of the Bemba people, and there are small field museums at some national monuments. Relics of the country's past are the concern of the Commission for the Preservation of Natural and Historical Monuments and Relics.

Since the 1950s the cultural scene has been transformed

by large-scale urbanization and exposure to exotic influences from Europe, the Americas, and other parts of Africa. Radio and television (one channel only and restricted to the Line of Rail, Chipata, Mongu, and Kasama) have sped this process. Various forms of theatre have flourished. In the last years of colonial rule, dance drama was developed for nationalist ends; the Chikwakwa Theatre, based at the University of Zambia, pioneered politically radical popular drama in the early years of independence. In the 1980s, aid agencies and other bodies promoted "theatre for development," often unscripted and in vernacular languages, and government departments have used drama to communicate agricultural and health messages.

Publishing

The once-noted independence of the press was compromised by government and party control: ownership of the *Times of Zambia* passed to the party in 1982, and the *Zambia Daily Mail* has been in government ownership since 1965. The church-owned weekly *National Mirror,* founded in 1970, was able to take a more independent line, as has the *Weekly Post,* which first appeared in 1991 in the wake of moves toward a more pluralist political system.

The Zambia Publishing House (formerly the Kenneth Kaunda Foundation) is a government-backed publisher of the works of Zambian authors and school textbooks. The few other publishers are mainly church-supported. Zambian scholars have contributed to knowledge in a wide range of disciplines, often in locally published academic journals, though opportunities for research have been restricted in recent years by general economic difficulties.

HISTORY

Archaeology and early history. Stone tools attributable to early types of man have been found near the Victoria Falls and in the far northeast, near Kalambo Falls. In 1921, excavations at Kabwe revealed the almost complete skull of *Homo sapiens rhodesiensis* ("Broken Hill Man"), which may be well over 100,000 years old. However, by 20,000 BC the only surviving type of human throughout the Old World was the ancestor of modern man, *Homo sapiens sapiens,* who developed the use of spears, the bow and arrow, game traps, and grindstones. Remains of such industries have been found in much of central and northern Zambia, sometimes near lakes and rivers but often in caves and rock-shelters.

Bantu migrants

During the 1st millennium AD, Zambia was occupied by migrants from farther north who may be presumed to have spoken Bantu languages; they certainly cultivated crops and kept domestic stock. Traces of ironworking in central and western Zambia have been dated to the first five or six centuries AD. Iron tools and weapons greatly increased mastery over both man and nature and, together with food production, promoted population growth. Stone-using hunters and gatherers were liable to be overrun and absorbed by the food producers, though some survived on the edges of farming zones until a few centuries ago. The complex layers of paintings found in rock-shelters in northeastern Zambia indicate that the homes of stone-using hunters became the shrines of invading farmers.

In central Zambia, by the 6th century AD, the first food producers worked copper as well as iron. By about AD 1000, copper ingots were being made at Kansanshi, at the western end of the Copperbelt, which implies that copper was being traded extensively and perhaps used as currency.

Early in the 2nd millennium AD, cattle keeping became more intensive on the Batoka Plateau of southern Zambia, while cotton spinning and pipe smoking were introduced. The associated pottery seems directly ancestral to that made locally in the 20th century. Similar evidence of cultural continuity over a long period has also been found in the resemblance between modern pottery in central, northern, and eastern Zambia and a kind of pottery that has been dated to the 12th century AD. These major changes in pottery traditions have been ascribed to immigration; they also indicate thicker settlement of woodland through the adoption of *chitemene* cultivation, widespread in Zambia even today: this technique depends heavily on the use of iron axes, because seed is sown in the ashes of branches lopped from trees.

In southern Zambia, archaeology has thrown light on both the emergence of class distinctions and the beginnings of trade with the east coast. About the 14th century, a few people were buried wearing ornaments of seashells and exotic glass beads near Kalomo and at Ingombe Ilede, near the confluence of the Zambezi and Kafue. The latter burials also included gold beads, copper ingots, and iron bells of a kind later associated with chieftainship. These metals would have come from south of the Zambezi, but they were probably being reexported down the river by Muslim traders, either Arab or African.

The period between about 1500 and 1800 remains relatively obscure. This was when copper was most intensively mined at Kansanshi, but it is not known who was buying it. The main evidence for these centuries consists of oral traditions. In much of Zambia, from the upper Kafue to the Malaŵi border, there are legends of tribes being founded by chiefly families who came from Luba country in southeastern Zaire. Such stories should not be taken at face value: they dramatize prolonged processes of population drift and the spread of cultural influences. By the 18th century, small-scale chieftainship was probably widespread in northern and eastern Zambia, but few of the tribal names current today would have meant much: such names refer not to long-enduring communities but to changing perceptions of cultural and political differences.

Early 19th-century kingdoms

In the early 19th century, however, there were at least four areas in which the growth of kingdoms was strengthening the sense of tribal identity: in the east, among the Chewa; in the northeast, among the Bemba; on the lower Luapula, among the Lunda (who had indeed invaded from the west about 1740); and on the upper Zambezi, among the Luyana (later called Lozi). In the Lunda and Luyana kingdoms a prosperous valley environment encouraged dense settlement and prompted the development of relatively centralized government.

External contacts. Trade between Zambia and the Western world began with the Portuguese in Mozambique. Early in the 17th century, the Portuguese ousted Muslims from the gold trade of central Africa; early in the 18th century, they founded trading posts at Zumbo and Feira, at the confluence of the Zambezi and Luangwa; and by 1762 they were regularly acquiring ivory and copper from Zambians in exchange for cotton cloth. During the later 18th century, slave-owning Goans and Portuguese mined gold and hunted elephants among the southern Chewa. Their activities were reported to Kazembe III, the Lunda king on the Luapula, by Bisa traders who exported his ivory and copper to the Yao in Malaŵi. Kazembe already had indirect access to European goods from the west coast; he now hoped to cut out his African middlemen. One Goan visited Kazembe and was warmly received, but, though the Portuguese government dispatched further expeditions in 1798 and 1831, they came to nothing, mainly because the Portuguese on the Zambezi were turning their attention to exporting slaves rather than ivory or gold. Western Zambia was also beginning to be enmeshed in the Portuguese slave trade (directed to Brazil): from the early 19th century, African traders from Angola bought slaves to the north of the Lozi kingdom, though the Lozi themselves kept servile labour for production at home.

During the second half of the 19th century, Zambia was convulsed by traders, raiders, and invaders who came from north and south as well as east and west. From about 1840 to 1864, the Lozi kingdom was ruled by the Kololo, warrior-herdsmen who had fled north from Sotho country. In the 1860s and '70s the northern Chewa were conquered by a group of Ngoni, who had also come from the far south. Meanwhile, the Bemba and Kazembe's Lunda began selling ivory and slaves to Arabs and Africans from the east coast. At the same time, ivory and slaves were hunted in central Zambia by Chikunda adventurers armed with guns, and South African traders were buying ivory from the Lozi. A few rulers contrived to turn such trade to their own advantage, and the general

rise in demand for goods stimulated local production of ironwork, salt, tobacco, and food: indeed, several crops of American origin were introduced, such as corn (maize), cassava, peanuts, and sugarcane. Much of Zambia was devastated by marauders, however.

British rule

At the end of the 19th century, Zambia came under British rule. British interest in the region had first been aroused by the missionary-explorer David Livingstone, who crossed Zambia during three great expeditions between 1853 and his death, near Lake Bangweulu, in 1873. Livingstone's reports of the expanding slave trade inspired other missionaries to come to central Africa and continue the struggle against it, but it was the mining magnate Cecil Rhodes who ensured that so much country north as well as south of the Zambezi came within a British sphere of influence during the "Scramble for Africa." In 1889 the British government granted a charter to Rhodes's British South Africa Company (BSAC), bestowing powers of administration and enabling it to stake claims to African territory at the expense of other European powers. The curious butterfly shape of Zambia resulted from agreements in the 1890s between Britain and Germany, Portugal, and the Belgian king Leopold II, and these in turn rested on treaties, mostly stereotyped in form, between Rhodes's agents and African chiefs.

At this stage there was little resistance to white intrusion. The most immediate threat to African land and labour came in Ngoniland, thought by whites to be rich in gold, and the Ngoni duly fought company troops in 1898. The Bemba, however, faced no such challenge and in any case were deeply divided, while the Lozi king believed that alliance with the company would protect his empire against both the Portuguese and the Ndebele. It is also likely that disease and famine undermined the will to resist: there were smallpox epidemics in the early 1890s, widespread rinderpest in 1892–95, and locust plagues throughout the decade.

Formation of the Rhodesias

Colonial rule. At first the BSAC administered its territory north of the Zambezi in two parts, North-Eastern and North-Western Rhodesia. In 1911 these were united to form Northern Rhodesia, with its capital at Livingstone, near the Victoria Falls. The population was probably about one million. There were about 1,500 whites: some came to mine surface deposits of copper, and a few, mostly from South Africa, farmed on the plateau east of Livingstone. However, the BSAC regarded the country chiefly as a source of labour for gold and coal mines in Southern Rhodesia and for the copper mines in Katanga, in the Belgian Congo, which in 1910 were linked by rail to Southern Rhodesia and the east-coast port of Beira, Mozambique. By then, company officials had been posted to most parts of Northern Rhodesia and levied taxes in order to force Africans to seek work: such pressure sometimes provoked violent, but small-scale, resistance.

World War I bore heavily on the territory. For the campaign against the Germans in East Africa, 3,500 troops were recruited and 50,000 porters conscripted, mostly from the northeast; many never returned. Food supplies were requisitioned, yet food production was crippled; women, as always, bore the brunt of sowing and harvesting, but, in the absence of men to cut trees and clear new land, farm plots were worked to exhaustion. Labour was also urgently needed for mining: war boosted the demand for base metals from Northern Rhodesia as well as Katanga. The Bwana Mkubwa mine exported copper from 1916 to 1918, and from 1917 to 1925 the country's main export was lead from Broken Hill (now Kabwe). African resentment of wartime hardship found expression in the millennial Watchtower movement, which inspired rebellion among the Mambwe in the northeast. More effective opposition to BSAC rule came from white settlers, especially when an income tax was imposed in 1920. The company was ready to give up the increasingly costly burden of administering Northern Rhodesia and in 1924 handed over this responsibility to the Colonial Office in London, which soon set up a legislative council to which five members were elected by the white population, then about 4,000.

The British government hoped to increase white settlement as part of a wider strategy to strengthen British influence between South Africa and Kenya. Land was reserved for white ownership along the railway line, in the far north, and in the east; around these areas African reserves were marked out in 1928–30. This soon led to overcrowding, soil exhaustion, and food shortage; yet few whites took up the land available to them. By 1930 it was clear that copper was the country's most promising resource. Huge deposits had been located far beneath the headwaters of the Kafue and were mined by companies mostly financed from South Africa, through the Anglo American Corporation, and the United States, through the Rhodesian Selection Trust.

The mining industry

In 1930–31 prices for copper collapsed, partly as a result of the worldwide depression. However, the new mines enjoyed a comparative advantage, since they worked high-grade ores at relatively low cost. For skilled labour, they depended on whites who had to be paid what they might have earned in South Africa; but African labour was cheap and abundant, and employers accepted a high turnover rate rather than provide the amenities that would encourage permanent African settlement in urban areas. From 1935, copper prices rose sharply, and by 1938 Northern Rhodesia contributed more than 13 percent of noncommunist copper production.

Yet copper exports did not confer much prosperity. Near the railway, African as well as white farmers grew food for the mines, but most African farmers were too remote from the market to be able to earn a cash income. More than half the able-bodied male population worked for wages away from home, and as many of these worked outside the territory as within it. On the Copperbelt itself, low wages and poor conditions provoked Africans to strike at three mines in 1935. Nor were rising copper sales of much benefit to the government (whose capital was moved to Lusaka in 1935). The mineral rights were owned by the BSAC, which duly exacted royalties. Taxation was levied on what profits remained, but half was retained by the British government, which made only tiny grants for economic development. In 1938 these arrangements were criticized by a visiting financial expert, Sir Alan Pim: in a report to the Colonial Office, he urged more public investment in roads, schools, and health services, for Africans as well as whites. Missionaries ran many primary schools, but in 1942 only 35 Africans were receiving secondary education.

When World War II broke out in 1939, Britain contracted to buy the whole output of the Copperbelt. British dependence on undisturbed copper production meant that white mine workers were allowed to maintain an industrial colour bar. Nonetheless, a second strike by African mine workers, in 1940, caused a revision of wage scales to take account of accumulating experience and skill. After the war the new Labour government in Britain began to promote the formation of African trade unions, and by 1949 half the African mine workers in Northern Rhodesia belonged to a single union. In the same year, new legislation confirmed that (in contrast to South Africa and Southern Rhodesia) African unions had the same bargaining rights as those of white workers. Meanwhile, between 1942 and 1946, African teachers, clerks, foremen, and clergy had formed welfare societies both in the mining towns and in rural areas; in 1948 these gave rise to the Northern Rhodesia Congress. Some of its members sat on the African Representative Council set up by the government in 1946; this body had no power, but it criticized political and social conditions, especially the informal colour bar, and from 1948 it elected two Africans to sit on the Legislative Council. In the countryside, "indirect rule" through chiefs became more broadly representative.

In some respects, Africans made important advances in the first postwar years. On the other hand, these advances also strengthened white aspirations to settler self-government, as in Southern Rhodesia. Although whites formed less than 2 percent of the Northern Rhodesian population, their numbers rose between 1946 and 1951 from 22,000 to 37,000, partly because of immigration from Britain. The Legislative Council included eight elected white members, and in deference to them a large-scale development plan was drastically revised between 1947 and 1953 at the expense of African education. Yet this was not enough:

to many whites the best hope of entrenching white supremacy seemed to lie in amalgamation with the south. This ambition gained support from British politicians and civil servants who feared that Southern Rhodesia would otherwise fall under the sway of the Afrikaner nationalists who had come to power in South Africa in 1948. In 1951 the British Labour government was replaced by Conservatives less concerned to avoid alienating African opinion. Despite widespread popular protest, in which chiefs and Congress combined, in 1953 Northern and Southern Rhodesia and Nyasaland were brought together in the Central African Federation.

Creation of the Central African Federation

The federation was a curious and unstable compromise. Its government was based in Southern Rhodesia, which also dominated the federal parliament. It had wide powers over all three territories, though in the north Britain retained control over questions of African land, education, and political status. At first, African suspicions of federation were blunted in Northern Rhodesia by an economic boom. Copper prices had risen steeply following sterling devaluation in 1949 and the outbreak of war in Korea in 1950; the mining companies finally began to pay regular dividends, while the Northern Rhodesia government received a share of royalties. Following a major African strike in 1952, the real wages of African mine workers at last moved upward. The companies increased their use of machinery and African skills; in 1955 the industrial colour bar was breached, and a select minority of African workers were encouraged to live out their working lives in the mining areas: "stabilized" labour began to replace oscillating migrant labour.

In 1956, however, the copper boom came to an end. Whites in Northern Rhodesia became increasingly aware of how far the federal tax system channeled copper profits into Southern Rhodesia. Many Africans were thrown out of work, while little had been done to help African farming or education, despite federal propaganda for "partnership." A new generation of Congress leaders wanted Northern Rhodesia to become an independent African state, as Ghana had in 1957. In 1958, led by Kenneth Kaunda, a former teacher and civil servant, these radicals split off from Congress to found the Zambia African National Congress and its successor, the United National Independence Party (UNIP). Britain accepted that Africans would have to be given more power than the federal government was willing to concede. In 1962 UNIP organized a massive campaign of civil disobedience, but it agreed to take part in elections under a new constitution: an election later that year gave Africans a majority in the legislature. The federation was dissolved at the end of 1963. Early in 1964 an election based on universal adult suffrage gave UNIP a decisive majority, and it was supported by nearly a third of the white voters. On October 24 the country became the independent Republic of Zambia, within the Commonwealth and with Kaunda as executive president.

Formation of UNIP

Zambia since independence. During the early years of independence, Zambia was comparatively prosperous. Copper prices rose steadily from 1964 to 1970, boosted by the Vietnam War, and Zambia became the world's third largest producer of copper. Meanwhile, the leakage of copper profits abroad was greatly reduced. In 1964 the government acquired the mineral rights of the BSAC, and thereafter it also increased mining taxation. The country embarked on long-overdue investment in communications and social services. In 1960 there had been only 2,500 Africans in secondary schools; by 1971 there were 54,000. At independence there were fewer than 100 Zambian university graduates; in 1965 the University of Zambia was founded, and by 1971 it had 2,000 students. Zambians finally began to predominate in the upper ranks of the civil service, the army, business, and the professions. The copper industry still relied heavily on white expertise, but the colour bar had vanished, and in 1966 black mine workers secured a large increase in pay, which soon affected wage levels generally.

On the other hand, Zambia incurred massive costs from the survival of white supremacy across the Zambezi. Following (Southern) Rhodesia's Unilateral Declaration of Independence (UDI) in 1965, the United Nations imposed sanctions intended to isolate that country, but these bore much more heavily on Zambia. Copper exports were expensively rerouted northward, and a tarmac road and oil pipeline were built to Dar es Salaam, Tanz. Trade with Rhodesia was steadily reduced, and the border was finally closed in 1973. A new coal mine and new hydroelectric schemes made Zambia largely independent of the Rhodesian-controlled power station at the Kariba Dam (built in 1959). In 1970–75 China built a railway from the Copperbelt to Dar es Salaam, which committed Zambia and Tanzania to extensive trade with China and to a huge loan for which payment was deferred until the 1980s.

National integration had been a major task for Zambia's leaders at independence. White settlers presented no great difficulty, and those farmers who stayed on were valued for their major contribution to food production. African "tribalism" was a more serious problem. This had less to do with the survival of precolonial political loyalties than with regional differences aggravated under colonial rule and the absence of any African lingua franca. The Lozi and other peoples in the west and south had long depended on labour migration across the Zambezi; the Copperbelt was dominated by Bemba speakers from the northeast. Kaunda did not himself belong to any major ethnic group, but his continuation in power required constant reshuffling of colleagues in the party and the government to preclude the emergence of a rival. In the name of national unity, UNIP sometimes made exaggerated claims to allegiance; such claims had brought it into armed conflict in 1964 with the Lumpa church founded by Alice Lenshina and in the late 1960s with Jehovah's Witnesses. UNIP also challenged the independence of the judiciary, though from 1969 the authority of the bench was strengthened by the appointment of black Zambian judges.

National integration

In the early 1970s Zambia's economic fortunes took a turn for the worse. Copper continued to provide the great bulk of export earnings, but prices fluctuated erratically; they then failed to recover from a steep fall in 1975. The price of oil shot up in 1973, and inflation, already serious, rapidly increased. The government, committed to high spending, both public and private, reacted by borrowing heavily abroad and drawing on reserves. Investment declined, as did the efficiency of the transport network. State control of the mining industry, achieved in 1969–75, artificially prolonged its life but also increased the scope of corruption, as did parastatal corporations set up to promote industrial diversification.

The government became increasingly authoritarian. Kaunda felt threatened by critics at home and by the illegal Rhodesian regime, which harassed African guerrillas based in Zambia. UDI had already prompted Kaunda to impose emergency regulations, which thereafter were regularly renewed by Parliament and enabled the president to detain political opponents without trial. In 1973 Parliament approved a one-party constitution, and in 1975 UNIP took over Zambia's main newspaper. To some extent, fear of foreign attack diminished with the advent of independence in Portuguese Africa in 1975 and in Rhodesia (Zimbabwe) in 1980. But warfare in Angola and South African interference continued to provide pretexts to curb internal opposition.

The move to a one-party state

Still more worrying, however, was the deepening economic crisis. Kaunda urged Zambians to look to agriculture rather than mining for a solution, but rural development policies, though consuming foreign aid, were mostly ill-conceived and failed to stem the historic drift to the towns. By 1980, out of a population of 5.7 million, more than 2 million lived in towns, many without jobs or housing: inevitably, disease and crime flourished. Urban dwellers refused to pay the high prices that might have encouraged more farmers to produce for the market. Government subsidies sometimes bridged the gap, but their partial removal in 1986 and 1990 provoked major food riots in the towns. The restoration of subsidies in 1987 cost Zambia the support of the International Monetary Fund, though such support had been critical in coping with enormous foreign debts. Mounting discontent was reflected in recurrent closings of the university, and in August 1991, in response to widespread pressure, the National Assembly

abolished the one-party state. Multiparty elections were held in October, and Kaunda was decisively defeated by a trade union leader, Frederick Chiluba, who duly became president. UNIP was left with fewer than one-sixth of the seats in the National Assembly.

Zambia's experience in the 19th and 20th centuries has in many ways been typical of the Third World. External trade has been primarily based on extractive forms of production: the export of ivory, labour, and copper. Profits from copper eventually made possible widespread cultural as well as economic involvement with the developed world, but by then that world was losing interest in what Zambia had to offer. Expanding state control and foreign loans provided cushions against adverse trading conditions but masked systemic inefficiency and could not indefinitely postpone a day of reckoning. Throughout the 20th century, Zambia's difficulties were indeed compounded by its proximity to white supremacies farther south, but this very fact gave other powers an interest in maintaining political stability within Zambia after independence: in effect, loans and aid helped to dampen internal economic conflict. In 1991 the prospect of fundamental change in South Africa raised the question of whether Zambia would continue to attract such interest or would be relegated to the margins of international concern. (A.D.R.)

For later developments in the history of Zambia, see the BRITANNICA BOOK OF THE YEAR.

Zimbabwe

Zimbabwe is a republic in southern Africa. It achieved majority rule and internationally recognized independence in April 1980 following a long period of colonial rule and a 15-year period of white-dominated minority rule, instituted after the minority regime's so-called Unilateral Declaration of Independence (UDI) in 1965.

Zimbabwe shares a 125-mile (200-kilometre) border on the south with the Republic of South Africa and is bounded on the southwest and west by Botswana, on the north by Zambia, and on the northeast and east by Mozambique. Its total area is 150,873 square miles (390,759 square kilometres). The capital is Harare (formerly called Salisbury).

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Zimbabwe lies almost entirely over 1,000 feet (300 metres) above sea level. Its principal physical feature is the broad ridge running 400 miles from southwest to northeast across the entire country, from Plumtree near the Botswana frontier through Gweru (formerly Gwelo) and Marondera (formerly Marandellas) to the Inyanga Mountains, which separate Zimbabwe from Mozambique. About 50 miles wide, this ridge ranges in altitude from 4,000 to 5,000 feet, until it eventually rises to 8,504 feet (2,592 metres) at Mount Inyangani, the highest point in Zimbabwe, in the eastern highlands. This ridge is known as the Highveld and comprises about 25 percent of the country's total area. On each side of this central spine, sloping down northward to the Zambezi River and southward to the Limpopo River, lies the wider plateau of the Middleveld, which, at an altitude between about 3,000 and 4,000 feet, makes up roughly 40 percent of Zimbabwe's area. Beyond this again and mostly in the south, where the Sabi, Lundi, and Nuanetsi rivers drain from the plateau into the Limpopo, lies the Lowveld, which constitutes approximately 23 percent of the country's total area. The lowest point in Zimbabwe lies at an altitude of 660 feet near Dumela, where the Limpopo flows into Mozambique. There are no parts of Zimbabwe that can properly be called desert, although a sector northwest of Plumtree and a lengthy belt across the Lowveld in the south are severely arid.

Geology

The landscape is characterized by extensive outcroppings of Precambrian rock, which is between 570 million and 3.8 billion years old. The most ancient part of this rock formation, known as the basement complex, covers the greater part of the country. About four-fifths of the basement complex consists of granite; the Matopo (Matopos) Hills south of the city of Bulawayo are formed from prolonged erosion of an exposed granite batholith. Some of the hills are surmounted by formations, known as balancing rocks, that have been eroded by wind and water along regular fault lines, leaving some blocks precariously balanced upon others. Elsewhere are found innumerable small rounded granite hillocks known locally as kopjes. Belts of schist in the basement complex contain the veins and lodes of most of the country's gold, silver, and other commercial minerals.

The Great Dyke, which is up to 8 miles wide and about 330 miles long, is another notable landscape feature. The longest linear mass of mafic and ultramafic rocks in the world, the Great Dyke bisects the country from north to south and contains enormous reserves of chromium, nickel, and platinum. The Alkali Ring complexes near Beitbridge in the Sabi valley are distinctive igneous intrusions. The Karroo (Karoo) System—a thick layer of sedimentary rocks consisting of shale, sandstone, and grit of Permian and Triassic age (208 to 286 million years old)—covers the Zambezi valley and the valleys of its tributaries from Hwange (formerly Wankie) southward to Bulawayo and spreads across parts of the southern Lowveld from Tuli, near the southern border, to the Sabi River.

Drainage and soils. Major faulting from southwest to northeast formed the middle Zambezi trough, which is now partially flooded by the Lake Kariba reservoir. Other faulting episodes affected the depressions of the Sabi and Limpopo rivers. Except for a small area of internal drainage in the dry southwest, these three rivers carry the entire runoff of the country to the Indian Ocean via Mozambique. The central ridgeline of the Highveld is the major divide separating Zambezi from Limpopo-Sabi drainage.

The light, sandy soils found in most parts of Zimbabwe are residual soils developed largely from the granite parent material. They are highly weathered and leached, even in the areas of lower rainfall, and do not easily retain water because of their coarse texture. Outcrops of basement schists give rise to rich red clays and loams—some of the country's best soils—but their extent is limited. Since most rain occurs in heavy showers during a few months of the year, rapid runoff and high rates of erosion are common. The meagre mineral reserves in most soils imply an inherently low fertility; under cultivation, productivity drops rapidly after a few years. The difficulty of cultivating these lighter soils is greatest in the black farming areas, where population pressure no longer allows land to be temporarily abandoned to rejuvenate after cultivation; black farmers, because of a lack of capital, are also less able than white farmers to maintain the mineral fertility with manure and chemical fertilizers.

Low fertility of soils

Climate. Zimbabwe, lying north of the Tropic of Capricorn, is completely within the tropics but enjoys subtropical conditions because of its high average elevation. Toward the end of the hot, dry months, which last from August to October, monsoon winds that have crossed the Indian Ocean and Mozambique result in intense orographic rainfall when they meet the rampart formed by the eastern highlands. The eastern regions consequently receive the country's heaviest rainfall and have a more prolonged rainy season (lasting from October into April) than the rest of Zimbabwe. The high altitude of the broad plateau of western Zimbabwe helps to guarantee fine weather there during the cool, dry winter months from May to August.

June is generally the coolest month and October the warmest; temperature variations correspond closely to altitude. Inyanga, at about 5,500 feet in the eastern highlands, varies in temperature from a mean of 52° F (11° C) in July to one of 65° F (18° C) in October. Harare, at about 4,800 feet, has seasonal temperatures varying from 57° F (14° C) to 70° F (21° C), and Bulawayo, at 4,400 feet, varies from 57° F (14° C) to 70° F (21° C). Daily variations about these means are some 13° F (7° C) warmer in the afternoon and 13° F (7° C) cooler at night. Harare and Bulawayo each average about eight hours of sunshine per day, and this average does not drop below six hours during the rainy season.

Plant and animal life. Zimbabwe is predominantly savanna (tropical grassland), with a generous tree growth

encouraged by the wet summers. The only true forests, however, are the evergreen forests of the eastern border and the savanna woodland, which includes teak, northwest of Bulawayo. Various species of *Brachystegia* (a hardwood tree up to 90 feet high with pale reddish brown wood) are dominant in the Middleveld and Highveld. Other common species include the mohobohobo (a medium-size tree with large spadelike leaves) and the thorn tree. In the valleys of the Zambezi and Limpopo rivers, the mopane, which resembles the mohobohobo, is common, together with the stout-trunked baobab and the knobby thorn tree. Australasian eucalyptus trees have been widely introduced, predominantly on white-owned farms, where they are used as windbreaks and for fuel; Australian wattle has been planted in the eastern districts as a source of tannin. Pure grassland is uncommon but occurs particularly along the eastern border around Chimanimani (Mandidzudzure, formerly Melsetter).

Cultivation of the land and the reduction of the natural vegetation have resulted in the disappearance of many forms of animal life over large areas. Hwange National Park, holding some of the densest remaining wildlife concentrations in Africa, has an area of more than 5,000 square miles and stretches from the Bulawayo–Victoria Falls railway line westward to the Botswana border. Among the flesh-eating animals found there, and occasionally elsewhere, are the lion, leopard, cheetah, serval, civet, aardvark, spotted and brown hyena, black-backed and side-striped jackal, zorille, ratel, bat-eared fox, ant bear, and scaly anteater. Elephants are found in the northern region, and giraffes in the western bushland; hippopotamuses and crocodiles live in the larger rivers. Among a great variety of hoofed and horned ruminant animals are the eland (which is immune to the deadly tsetse fly), greater kudu, blue duiker, impala, klipspringer, steenbok and grysbok, and sable and roan antelope. Snakes include mambas, boomslangs, and the black-necked cobra. Baboons, which are the bane of farmers whose crops they damage, include the Rhodesian and yellow species, as well as the chacma, the largest known baboon species. Notable among the birdlife are the martial eagle, the bateleur eagle, and the little hammerhead, which builds enormous nests and is revered as a bird of omen.

Hwange National Park

Settlement patterns. Zimbabwe may be divided into six different regions of agricultural potential, with the amount of rainfall constituting the determining factor in land use. The eastern highlands, with more than 25 inches of rainfall annually, are suitable for diversified farming with cattle and plantation and orchard crops. Roughly one-fifth of the country, sweeping west along the central spine past Harare and on to the midlands, receives 20 to 25 inches of rain and is used for intensive farming of corn (maize) and tobacco and the raising of livestock. An almost equal area to the southwest, enclosing Bulawayo, receives 16 to 20 inches of rain a year; it is suitable for mixed farming and for raising livestock on a semi-intensive scale. One-third of the country, lying farther outward from the spine of Zimbabwe, mostly to the south, and receiving 14 to 18 inches of rainfall annually, is used for semi-extensive farming, while about one-fourth of the country in the Lowveld toward the Limpopo and Zambezi rivers, receiving less than 16 inches a year, is fit only for ranching. Finally, a small area, mostly in the far north toward the Zambezi River, is unsuitable for either agriculture or forestry.

Land ownership

Prior to independence most of the country's best farmland was in the hands of white settlers or absentee landlords. In consequence, the nationalist struggle focused sharply upon the issue of land ownership, and a major concern for the Zimbabwe government after independence was to carry through land reform in the rural areas and launch large-scale settlement of black families on former white farms.

The Land Apportionment Act, a segregationist measure that governed land allocation and acquisition prior to independence, made no provision for blacks who chose an urban life, because towns were designated as white areas. As a result, though urban blacks now outnumber whites by more than four to one, blacks mostly live in rented homes in townships located some miles from city centres. The cities of Harare and Bulawayo therefore constitute studies in contrast, with impressive office buildings and quiet white suburbs partially ringed by crowded black townships. The Land Tenure Act, a more rigidly segregationist law that superseded the Land Apportionment Act in 1969, was amended in 1977, while the civil war was still being fought, to allow blacks to purchase white farms and urban property, and after the end of hostilities residential segregation began to be significantly breached.

The people. *Ethnic and linguistic composition.* More than two-thirds of the population of Zimbabwe speak Shona as their first language, while about one out of five speak Ndebele. Both Shona and Ndebele are Bantu languages; from the time of their great southward migration, Bantu-speaking tribes have populated what is now Zimbabwe for more than 10 centuries. Those who speak Ndebele are concentrated in a circle around Bulawayo, with Shona-speaking peoples beyond them on all sides—the Kalanga to the southwest, the Karanga to the east around Nyanda (formerly Fort Victoria), the Zezuru to the northeast, and the Rozwi and Tonga to the north. Generations of intermarriage have to a degree blurred the linguistic division between the Shona and Ndebele peoples.

Among the whites in Zimbabwe at independence were the descendants of the country's first European immigrants. Only about one-quarter of the adult white population, however, were born in Zimbabwe. After World War II the white population grew severalfold because of heavy immigration, and some two-thirds of the present white population have their origins in Europe, the great majority from Britain. The rest have come largely from South Africa. Of the whites living in rural areas, about one-quarter are Afrikaners.

There are several thousand Asians, forming a community that is predominantly concerned with trade. There are also Zimbabweans of mixed race, called Coloureds, who are mainly skilled and semiskilled workers.

English is the official language of government; teaching in schools is also conducted in English, except for the instruction of the youngest children in black schools.

Religion. The great majority of the black population adheres to traditional religion based on reverence for ancestors. The Shona have preserved their ancient reputation for prophecy, divination, and rainmaking; they believe in Mwari, a supreme being. The stone ruins of Great Zimbabwe are regarded as a shrine of deep religious significance, as also are parts of the Matopo Hills. In the last 50 years Christian mission schools have exercised much influence in the country, and most of the members of the first Cabinet of independent Zimbabwe were graduates of these schools. The Roman Catholic, Anglican, Methodist, Presbyterian, Baptist, and Dutch Reformed churches are represented. Because the Roman Catholic church supported nationalist aspirations, it held a position of influence in the postindependence period.

Traditional religion

Immigration and emigration. Migration has been the most important factor influencing the size and composition of the white population. Net migration figures have fluctuated in reaction to political events. In the years immediately preceding the breakup of the Federation of Rhodesia and Nyasaland, there was a net emigration of 13,000 whites; this was followed during the first 10 years of UDI by a net immigration of 40,000 (with 111,270 immigrants and 71,330 emigrants). As warfare spread after 1976, the pendulum swung again from a peak white population of 260,000 to fewer than 200,000 after independence. These net figures obscure, however, the gross turnover during 1965–79 of 132,560 immigrants and 133,864 emigrants. Even when allowance is made for the subsequent return of some emigrants, it is probable that at least half of the country's adult whites were newcomers after 1965.

Distribution of population. About one-fourth of the total population live in urban centres, nearly two-thirds of them in either Harare or Bulawayo. Among urban blacks, there is a disproportionately large number of males of working age, leaving an excess of older people, women, and children in rural areas. At least half of the black households are partly or wholly dependent on incomes earned in the wage economy.

The economy. The government of independent Zimbabwe moved cautiously to alter the pattern of management that it inherited from the white minority regime.

Private enterprise and socialism

The first budget of July 1980 was described by the finance minister as "conservative [with] a mild and pragmatic application of socialism." But the whites had passed on government machinery that included many levers of economic power. While the whites by inclination were wedded to a system of private enterprise, they had evolved a system of government intervention to support infant industries and maintain agricultural prices through marketing boards. The need to cushion the blows dealt by economic sanctions during UDI brought acceptance of the imposition of exchange and import controls.

The government raises nearly half of its revenue from personal and corporate income taxes that since 1966 have been collected on a pay-as-you-earn system. About two-fifths of government revenue comes from customs and excise duties and sales taxes, a small portion from investments, and much of the rest from government borrowing and, since independence, international aid.

The independent Zimbabwe government removed sales taxes on the staple items of food and fuel for the poorest people and extended sales taxes to travel, hotel accommodations, taxis, telecommunications, and other services. It continued the former rates of personal income tax.

The evolution of the trade union movement was some two years behind the pattern of political change by 1980. The Robert Mugabe government dealt with immediate labour problems, such as strikes for a higher minimum wage, rather than institute a thorough revision of the basic Industrial Conciliation Act of 1959. The government seemed to favour the strengthening, by mergers or amalgamation, of small unions in the same industry; the strengthening of the whole movement by the formation of a single trade-union congress from the five or six existing confederations of unions; and an arm's-length relationship of government with such a congress. Despite the large number of unions in existence, the largest sections of the labour force—the agricultural workers and domestic servants—remained outside the system.

Consolidation of trade unions

Employers' groups, such as the Associated Chambers of Commerce of Zimbabwe and the Association of Rhodesian Industries, remained influential.

Agriculture. Agriculture is the most important productive sector of the country's economy. It regularly generates about 15 percent of the gross domestic product (GDP) and some 40 percent of foreign-exchange earnings. More than one-half of the total labour force and one-fourth of the formally employed are engaged directly in agricultural activities.

The sector is divided into large-scale commercial farming, which occupies some 40 percent of the total land area and is dominated by white farmers, and small-scale farming, which is both commercial and subsistence in nature. Occupying about the same total area as the large-scale commercial sector—but on land that is considerably less fertile—smallholders have steadily increased their share of the country's total agricultural output since independence, from about one-tenth in the early 1980s to about half of total production in the early 1990s. To accelerate this trend and redress the issue of land distribution, the government has purchased many large farms and established resettlement areas on them for African farmers.

Crop production is well diversified. The most important food crop is corn, which is grown throughout Zimbabwe but does best in the well-watered northeast. Enough corn is usually produced so that Zimbabwe is able to meet its domestic demand and also export a sizable quantity.

Wheat production has grown steadily since the 1960s, but the country meets only about two-thirds of its high domestic demand and must import the rest. Other food crops include millet, sorghum, barley, cassava, peanuts (groundnuts), soybeans, bananas, and oranges.

Tobacco production

Tobacco, of which Zimbabwe is the largest producer in Africa, is the principal cash crop. It contributes about two-thirds of all agricultural export revenue and employs more than one-tenth of the work force. Three types of tobacco have traditionally been grown in the country: Virginia flue-cured, on the large commercial farms; burley, mostly by smallholders; and Turkish, of more limited extent.

Tobacco farming near Marondera, eastern Zimbabwe.

Cotton is a chief export crop and also the foundation of a large domestic textile industry. Grown by both smallholders and large commercial farmers, cotton has increased steadily in output since the UDI period, when commercial farmers were forced to diversify their production away from an overreliance on tobacco.

Sugar is grown in the southern Lowveld. It is a major export, as well as the basis for an important fuel industry, which mixes the sugar by-product ethanol with gasoline to help decrease the country's reliance on expensive imported fuels. Coffee has increased in production many times over since the early 1970s. Grown mainly in the eastern highlands between Vumba and Mount Silinda, Zimbabwe's coffees are premium mild arabicas that command a favourable price on the world market.

Cattle are the preferred livestock of the country's farmers. Beef and dairy products, produced mainly by the commercial sector, account for about one-fourth of agricultural output in most years. Since independence there has been a growing domestic demand for beef, and, as one of the few African countries allowed to export beef to the European Community, Zimbabwe has developed a significant export trade in beef as well. Sheep, goats, and pigs are raised in some areas, but their importance is minor compared to cattle. Poultry is kept largely for home use.

Industry. Although mining accounts for less than 10 percent of the GDP and provides work for only about 5 percent of the employed labour force, its significance in the economy is considerable as a major earner of foreign exchange. Direct mineral exports account for about one-third of total export earnings.

It was the prospect of great mineral wealth—comparable to the gold deposits of the Witwatersrand in neighbouring South Africa—that attracted the first permanent European settlers in the 1890s. These great expectations faded for many years after the peak of gold production was reached in 1915. By the 1950s, however, production of the chromium mines along the Great Dyke was significant, as was that of asbestos and copper. During the UDI period, the value of mining output increased. The rise in gold prices in the 1970s revived gold as the country's leading export and led to the reopening in 1979–80 of more than 100 dormant mines. Nickel mining along the Great Dyke began on a commercial scale in the late 1960s. Zimbabwe's

huge coal reserves are estimated to be about 30 billion tons, much of it desirable low-sulfur bituminous coal. Production from the major coalfields near Hwange is limited, however, by the country's capacity to transport the coal by rail, an economic necessity because of coal's bulkiness.

Manufacturing industries

Manufacturing generates about one-fourth of the country's GDP, a proportion much greater than in any other black African state. From 1954 to 1963, then Southern Rhodesia was able to rely on the resources and larger market of the Federation of Rhodesia and Nyasaland for a 150 percent increase in manufacturing output. Then, after UDI in 1965, hundreds of new manufacturing projects were begun in an effort to defeat economic sanctions by import substitution. Because of the diversity in manufacturing that developed then, Zimbabwe today is able to provide nearly 90 percent of the manufactured goods used in the country. The export market for Zimbabwe's manufacturers, however, is hindered by a lack of foreign exchange in neighbouring countries.

Coal is the nation's primary energy source. A growing percentage of the coal utilized is transformed first into electricity, however, as new thermal generating plants fueled by coal are constructed. Electricity and water production contributes about 3 percent of the GDP. Its principal users are industries, mines, and farms. Electrification of the railways was begun in 1980 (coal and diesel remain the major energy sources for rail transport, however), and there has also been considerable electrification of low-cost housing in urban townships. Less than half the black homes in Bulawayo and Harare had their own electricity at the time of independence.

Apart from South Africa, Zimbabwe generates more electricity per capita than any country in sub-Saharan Africa. About one-third of the electric power is generated at the huge Kariba Dam on the Zambezi River. Most of the remainder is produced thermally.

Finance and trade. Finance and insurance services contribute about 6 percent of the GDP. The Reserve Bank of Zimbabwe, located in Harare, is the country's central bank. It is the sole bank of issue and administers all monetary and exchange controls. There are also private and government-sponsored commercial banks, a development finance bank, several merchant banks and discount houses, and a post office savings bank for individual savings accounts. The Zimbabwe Stock Exchange deals in both government securities and the securities of privately owned companies.

Economic sanctions during UDI, which had been imposed by stages from 1966 to 1968 on both imports and exports, were lifted in December 1979. They had been widely breached, particularly in mineral exports and in the supply of petroleum, but they nevertheless strongly affected certain commodities, such as tobacco exports. Although the trade surplus was diminished in 1979 by the rise in oil prices, the value of exports still outpaced that of imports. In the 1980s, Zimbabwe showed slow but steady growth in its trade surplus, as its unusually high level of export diversity proved able to weather changes in world demand for its commodities.

Trade surplus

Tobacco is the major export, accounting for about one-fifth of all export earnings, followed by gold, metal alloys, cotton, textiles, asbestos, corn, and sugar. The principal imports are fuels and petroleum products, aircraft and spare parts, chemicals, iron and steel plates, and miscellaneous manufactured goods. Zimbabwe's major trading partners are the United Kingdom, South Africa, Germany, Japan, and the United States.

Transportation. The main road system, which is excellent, generally follows the line of white settlement along the spine of the country, with two branches north to Victoria Falls and Kariba and a network fanning out from Nyanda, close to the Great Zimbabwe ruins. Wartime operations brought an improvement in certain areas, including the construction of strategic roads in the eastern highlands and near the Zambian border. The roads in white farming areas and the gravel and earth roads in the Tribal Trust Lands received barely adequate maintenance, however.

Zimbabwe has one of the densest rail networks in sub-Saharan Africa. The railway closely follows the main road network; its single track has a gauge of three feet six inches. The country has rail links with South Africa to the south and Zambia to the north. Two lines connect with lines through Mozambique to give landlocked Zimbabwe access to the ports of Maputo and Beira.

Air Zimbabwe replaced Air Rhodesia, a government-backed company that had operated only within Rhodesia and to and from South Africa. The international airport at Harare has one of the longest civil runways in the world. Seven other airports—at Bulawayo, Kariba, Gweru, Masvingo, Hwange, Buffalo Range, and Victoria Falls—can accommodate medium-size jet aircraft.

Administration and social conditions. *Government.* The constitution of Zimbabwe, which was written in London during September–December 1979 and which took effect at independence on April 18, 1980, secured majority rule for Zimbabweans. Under the constitution, white voters, registered on a separate roll, elected 20 of the 100 members of the House of Assembly. Although these members no longer can veto constitutional amendments, a unanimous vote was required during the first 10 years to alter the Declaration of Rights, which stipulates (among other matters) that, if land is acquired for settlement schemes, there must be "prompt payment of adequate compensation . . . remittable within a reasonable time to any country outside Zimbabwe." The British insisted that there be a constitutional head of state, a president elected by the House of Assembly, and an executive prime minister and that citizenship of Zimbabwe be automatically available to anyone who was (or had the qualifications to be) a citizen of Rhodesia immediately before independence. The former Senate of 40 members was abolished with a constitutional amendment in 1990, and 50 members were added to the House of Assembly. One hundred twenty seats in the assembly were elective, 10 secured for traditional chiefs, and 8 for the provincial governors, with the remaining 12 to be appointed by the president.

The 1980 constitution

At the time of independence, whites controlled the municipal councils, but legislation was soon introduced to amalgamate each municipal council with the council of its surrounding township, and, for the first time, black mayors were elected in 1981. Local government elections in rural areas replaced the old apparatus of district commissioners with a party-based council structure.

Justice. Under the constitution, the four-member Judicial Service Commission advises the president on the appointment of judges to the High Court. High Court judges may not be removed from office except for misconduct or incapacity. The first black lawyer was appointed a High Court judge in 1980. In addition to magistrates who preside over criminal and civil litigation, other courts adjudicate on matters of African law and custom.

Education. The dismantling of Rhodesia's segregated system of schooling began less than two years before independence. The minority government had concentrated upon providing compulsory (and virtually free) education for white children between the ages of 5 and 15 and had left the schooling of black children in the hands of missionaries. In 1950 there were only 12 government schools for blacks, compared with 2,230 mission and independent schools.

After independence, priority was given to upgrading the nation's school system. Many new schools were built in the drive toward free primary education for all. In the decade following independence, Zimbabwe achieved one of the highest primary school enrollment rates in Africa, with more than 90 percent of all children of primary school age attending school. Primary education begins at age seven, lasts for seven years, and has been compulsory since 1987. At least one rural secondary school has been established in each of the country's 55 districts. The University of Zimbabwe, founded in 1955 at Harare, is the country's primary institution of higher education.

Primary school enrollment

Health and welfare. Before 1980, health services were biased toward curative medicine in central hospitals. Missionaries had the major responsibility for running rural clinics and small hospitals. After independence, health allocations were increased.

As in other Third World countries, the burden of disease

is heaviest on Zimbabwe's youngest children. The infant mortality rate in malarial parts of the Zambezi valley has been as high as 300 per 1,000, and the rate is thought to lie between 120 and 220 per 1,000 as a whole. Measles, malaria, diarrheal diseases, and pneumonia are major causes of death. AIDS, however, has become the major health threat to Zimbabweans in the 21st century, with fully one-fourth of the adult population being infected. Improved nutrition is increasingly seen as the most important health need.

Cultural life. The most famous of Rhodesian-bred writers, Doris Lessing, settled in England in 1949. In some contrast, the nationalist struggle prompted a renaissance of Shona culture. A forerunner of this renaissance (and a victim of the liberation struggle) was Herbert Chitepo, both as abstract painter and epic poet. Stanlake Samkange's novels reconstruct the Shona and Ndebele world of the 1890s, while those of the much younger Charles Mungoshi explore the clash of Shona and Western cultures in both the Shona and English languages. Folk traditions have survived in dance and pottery. The revival of sculpture has drawn on tribal religion and totems to produce some remarkable works, particularly those of Takawira and the Tengenenge school of craftsmen who sculpt in hard serpentine. (C.W.S./Ed.)

Cultural renaissance

For statistical data on the land and people of Zimbabwe, see the *Britannica World Data* section in the BRITANNICA BOOK OF THE YEAR.

HISTORY

The remains of Stone Age cultures dating to 500,000 years ago have been found in Zimbabwe, and it is thought that the San, who still survive mostly in the Kalahari desert of Botswana, are the last descendants of these original inhabitants of southern and central Africa. They were driven into the desert by Bantu-speaking peoples during the long migrations from the north in the course of which the Bantu-speaking peoples populated much of Africa from Lake Chad to present-day South Africa. The first Bantu are thought to have reached Zimbabwe between the 5th and 10th centuries AD. The stone ruins of Zimbabwe date mainly from about the 9th century, although the most elaborate belong to a period after the 15th century and are of Bantu origin.

Portuguese exploration. The Portuguese, who arrived on the east coast of Africa at the end of the 15th century, dreamed of opening up the interior and establishing a route to connect their eastern settlements with Angola in the west. The first European to enter Zimbabwe was probably Antônio Fernandes, who tried to cross the continent and reached the neighbourhood of Que Que (now Kwekwe). Nearly 50 years later the "emperor" Mwene Matapa was baptized by a Jesuit father, and in 1569 an abortive Portuguese military expedition entered the interior in search of gold.

A second great movement of the Bantu peoples began in 1830, this time from the south. To escape from the power of the great Zulu chief Shaka, three important groups fled northward, one of them the Ndebele, who carved out a kingdom. The Ndebele were warriors and pastoralists, in the Zulu tradition, and under their formidable chief Mzilikazi they mastered and dispossessed the weaker tribes, known collectively as Shona (Mashona), who were sedentary, peaceful tillers of the land. For more than half a century, until the coming of European rule, the Ndebele continued to enslave and plunder the Shona. During this period, however, British and Afrikaner hunters, traders, and prospectors had begun to move up from the south, and with them came the missionaries. Robert Moffat visited Mzilikazi in 1857, and this meeting led to the establishment in 1861 of the first mission to the Ndebele by the London Missionary Society.

The British South Africa Company. In South Africa Cecil Rhodes formed the British South Africa Company, which received its charter in October 1889. Its objects were (1) to extend the railway from Kimberley northward to the Zambezi, (2) to encourage immigration and colonization, (3) to promote trade and commerce, and (4) to secure all mineral rights, in return for guarantees of protection and security of rights to the tribal chiefs.

In 1890 a pioneer column set out from Bechuanaland and reached the site of the future capital of Rhodesia without incident on September 12. There the new arrivals settled and began to lay claim to prospecting rights. The Ndebele resented this European invasion, and in 1893 they took up arms, being defeated only after months of strenuous fighting. Lobengula, Mzilikazi's son and successor, fled, and the company assumed administrative control of Matabeleland. In 1895 many of the pioneers were persuaded to take part in the Jameson Raid into the Transvaal and were captured and sent to England for trial. In the same year, the company-administered territories, which had previously been loosely known as Zambesia, were formally named Rhodesia by proclamation. In 1896 the Ndebele rose again. Returning from London, Rhodes met with the Ndebele chiefs and persuaded them to make peace. The Shona had at first accepted the Europeans, but they too became rebellious, and the whole country was not pacified until 1897.

European settlement

Economic and political development. By 1892 about 1,500 settlers from the south had arrived in Rhodesia. The railway reached Bulawayo in 1896 and Victoria Falls in 1904. By the following year there were 12,500 settlers in the country, and in 1909 gold exports were worth more than £2,500,000. Agricultural development, however, was slower, and it was not until 1907 that steps were taken to facilitate the acquisition of land. By 1911 nearly £35,000 worth of tobacco was being exported annually, and the European population had risen to 23,600.

From the earliest years, the settlers had demanded representation on the Legislative Council, which in 1903 comprised seven company officials and seven elected representatives of the settlers. In 1907 the settlers were given a majority of seats. In 1914, when the 25-year term of the company's charter was due to expire, the settlers, faced with the alternative of joining the Union of South Africa, asked for the continuation of the charter pending the grant of self-government. The British government therefore extended the charter for 10 years, with the proviso that self-government could be granted earlier if the settlers showed themselves capable of administering the country unaided.

Self-government. Immediately after World War I the pressure for self-government was resumed, and a royal commission was appointed to consider the future of the territory. As a result of the commission's report, a referendum of the electors among the 34,000 Europeans in the country was held in 1922; the choice was between entry into the Union of South Africa as its fifth province and full internal self-government. In spite of the offer of generous terms by the Union's prime minister, General Jan C. Smuts, a majority voted for self-government. On Sept. 12, 1923, Southern Rhodesia was annexed to the crown and became a self-governing colony. The British government retained control of external affairs and a final veto in respect to legislation directly affecting Africans.

The interwar period was one of material progress, with the development of a reasonably prosperous economy based on copper, gold, and other minerals, corn, tobacco, and cattle. By 1953 Southern Rhodesia had a European population of 157,000 and an annual revenue of more than £28 million.

The policy of Sir Godfrey Huggins (later Lord Malvern), who served as prime minister of Southern Rhodesia for 20 years, was to build a society in accord with Rhodes's dictum of "equal rights for all civilized men," one in which merit and not colour should be the test of political and economic advancement. He believed that political power should not be given to the Africans until they were sufficiently experienced to know how to exercise it in cooperation with the Europeans and thus to maintain the economic development built up over the years.

Lord Malvern's governing principles

A second principle in which Lord Malvern and most other Europeans in Southern Rhodesia and Northern Rhodesia (later Zambia) profoundly believed was that the two countries should be joined together, both for their mutual economic benefit and to ensure the establish-

ment of a powerful state based on British culture and traditions. Malvern failed to secure their amalgamation, but he supported the federation of Southern Rhodesia, Northern Rhodesia, and Nyasaland (later Malawi) when that solution was eventually accepted by the British in 1953.

Federation. In 1957 a new electoral law was passed providing for a common roll of voters (the "A" roll, composed only of whites) with a special roll for those with lower qualifications (the "B" roll, a tiny minority of the blacks). At the same time, there was growing political consciousness among the African population, together with increasing hostility to the idea of federation. Joshua Nkomo was one of the fiercest opponents of federation as the local leader of the African National Congress, and when that organization was banned he became president of the National Democratic Party in 1960. It, too, was soon banned, and he formed the Zimbabwe African People's Union (ZAPU), which in turn was banned in 1962. In 1963 Robert Mugabe broke with ZAPU to join the Zimbabwe African National Union (ZANU) and thereby split African support along ethnic lines—Nkomo retained the Ndebele ethnic minority (mostly in the Matabeleland region), while Mugabe garnered the Shona ethnic majority.

Formation of ZAPU and ZANU

In June 1962 the UN General Assembly called for a more liberal constitution for the territory. The election of December 1962, during which the 1961 constitution came into force, was boycotted by the African nationalists. The ruling United Federal Party was defeated by the more conservative Rhodesian Front (RF), and Winston Field became prime minister. At the end of 1963 the federation was dissolved, and Southern Rhodesia reverted to its former status as colony. (K.Br./K.In.)

Rhodesia and the UDI. The goal of the RF was Rhodesian independence under guaranteed minority rule. Field was replaced as prime minister in April 1964 by his deputy, Ian Smith. The RF swept all A-roll seats in the 1965 election, and Smith used this parliamentary strength to tighten controls on the political opposition. After several attempts to persuade Britain to grant independence, Smith's government announced the Unilateral Declaration of Independence (UDI) on Nov. 11, 1965.

British response to the UDI

Britain declined to respond to the UDI with force, instead attempting economic tactics such as ending the link between sterling and the Rhodesian currency and seizing assets. Smith's government countered by defaulting on its (British-guaranteed) debts, leaving the British liable while at the same time balancing its budget. The United Nations imposed economic sanctions in 1968, but these were only partly successful; some strategic minerals, especially chromium, were exported to willing buyers in Europe and North America, further strengthening the economy.

Unsuccessful negotiations with Britain continued. A 1971 proposal to lessen restrictions on the opposition led to the creation of a third nationalist movement, the United African National Council (UANC), led by the Methodist bishop Abel Muzorewa. Unlike ZAPU and ZANU—both banned and operating only from exile in Zambia and Mozambique, respectively—UANC was able to organize inside Rhodesia and held talks with the government during the 1970s. During the early 1970s ZAPU and ZANU had sporadically organized raids into Rhodesia, but in December 1972 the violence of the conflict intensified after a ZANU attack in the northeast. The Zambia-Rhodesia border was closed in 1973, but Mozambican independence in 1975 provided a valuable base of operations for ZANU, which had close links to the Frelimo government.

The white Rhodesian government was thus under diplomatic, military, and, increasingly, economic pressure for a settlement. The 1976 rapprochement between Nkomo and Mugabe led to the formation of the Patriotic Front (PF), which received "frontline" support from Rhodesia's majority-ruled neighbours. The fighting escalated in both area and intensity, and the emergency measures adopted by the government to counter it also served to increase antigovernment feeling. By 1979 the combination of pressures had forced Smith to accept the necessity of an "internal settlement."

Independence. A 1978 agreement with internal black leaders, including Muzorewa, promised elections for a transitional government that would provide for both black enfranchisement and protection of white political and economic interests. The UANC won a clear majority of the seats allotted to blacks in the April 1979 election, and the country adopted the name Zimbabwe. Without PF participation or support for Muzorewa's new government, however, Zimbabwe was unable to end the warfare. Diplomatic recognition of the new government was not forthcoming given the stalemate; after talks between Muzorewa, Mugabe, and Nkomo in London in late 1979, Britain briefly retook control of Southern Rhodesia as a colony until a new round of elections was held in February 1980. Of the 80 contested black seats, ZANU won 57, ZAPU 20, and the UANC 3. Mugabe became the first prime minister as Zimbabwe achieved an internationally recognized independence on April 18, 1980.

Mugabe's government

Mugabe's new government moved deliberately to redress inequalities of race and class, redistribute land, and promote economic development, with a one-party socialist state as its long-term goal. During the 1980s, drought and white emigration badly damaged the economy, which was already strained by the need for massive government spending in the long-neglected areas of black education, health, and social services. In 1982 Mugabe charged that Nkomo was plotting a coup and forced him out of office, while arresting other leaders of ZAPU. Nkomo's supporters in the Matabeleland region retaliated, precipitating a civil war. Fighting did not cease until Mugabe and Nkomo reached an agreement in December 1987 whereby ZAPU was subsumed into ZANU-PF, Mugabe became the country's first executive president, and Nkomo became one of the nation's two vice presidents. Mugabe was reelected in 1990, 1996, and 2002.

From the beginning of independence in 1980, the government struggled with the issue of land reform. Some 4,000 white farmers controlled about one-third of Zimbabwe's arable land, and squatters, incited by government promises and the lack of police protection, partially took over hundreds of white-owned farms. Nevertheless, public support for the farmers and opposition to Mugabe's increasingly autocratic rule were evidenced in February 2000 by the defeat of a referendum for a new constitution that would have given him the power to confiscate white-owned farms without compensation. Land seizure accelerated in mid-2002, however, as Mugabe was reelected yet again, albeit in controversial elections, and laws were enacted that made it easier to seize land. Mugabe's land-reform policies and his 1998 intervention in the civil war in Congo (Kinshasa), purportedly to protect his personal investments, provoked international outrage and the suspension of some economic aid for Zimbabwe. High unemployment and high rates of inflation also created problems.

In addition to severe political and economic turmoil, the spread of AIDS in Zimbabwe reached epidemic proportions. By the beginning of the 21st century, one in four adult Zimbabweans was infected, life expectancy had fallen to below 40 years, and hundred of thousands of children had been left orphans. (Ed.)

For later developments in the history of Zimbabwe, see the BRITANNICA BOOK OF THE YEAR.

BIBLIOGRAPHY

General works. *Africa South of the Sahara* (annual) and *Africa Contemporary Record* (annual) contain essays on southern African countries. The region may be seen in its larger context in ROLAND OLIVER and MICHAEL CROWDER (eds.), *The Cambridge Encyclopedia of Africa* (1981); while the *Standard Encyclopaedia of Southern Africa,* 12 vol. (1970–76), focuses on the region.

Physical and human geography. *The land:* ALAN B. MOUNTJOY and DAVID HILLING, *Africa: Geography and Development* (1988); and A.T. GROVE, *The Changing Geography of Africa* (1989), include discussions of regional geography. N. LANCASTER, *The Namib Sand Sea: Dune Forms, Processes, and Sediments* (1989), reviews the geomorphology of the Namib; while DAVID S.G. THOMAS and PAUL A. SHAW, *The Kalahari Environment* (1991), brings together work on the Kalahari desert. P.D. TYSON, *Climatic Change and Variability in Southern Africa*

(1986), discusses weather patterns. M.J.A. WERGER and A.C. VAN BRUGGEN (eds.), *Biogeography and Ecology of Southern Africa,* 2 vol. (1978), provides comprehensive coverage of the plant and animal life of the region. ANDREW MILLINGTON *et al., Biomass Assessment: Woody Biomass in the SADCC Region* (1989), assesses land cover and woody biomass resources in southern Africa for fuelwood energy planning. BARRY MUNSLOW *et al., The Fuelwood Trap: A Study of the SADCC Region* (1988), analyzes fuelwood collection, land degradation, and its socio-economic effects over much of southern Africa. (A.C.Mi.)

The people: Studies of southern African peoples are contained in GEORGE MURDOCK, *Africa: Its Peoples and Their Culture History* (1959); HAROLD K. SCHNEIDER, *The Africans: An Ethnological Account* (1981); JOCELYN MURRAY (ed.), *Cultural Atlas of Africa* (1981); CARMEL SCHRIRE (ed.), *Past and Present in Hunter-Gatherer Studies* (1984); JAN VANSINA, *Paths in the Rainforests: Toward a History of Political Tradition in Equatorial Africa* (1990), and "Western Bantu Expansion," *Journal of African History,* 25(2):129–145 (1984); EDWIN N. WILMSEN, *Land Filled with Flies: A Political Economy of the Kalahari* (1989), a challenge to stereotypes of hunter-gatherers in the Kalahari; RICHARD B. LEE and IRVEN DEVORE (eds.), *Kalahari Hunter-Gatherers: Studies of the !Kung San and Their Neighbors* (1976); ANTHONY TRAILL, "The Languages of the Bushmen," in PHILLIP V. TOBIAS (ed.), *The Bushmen: San Hunters and Herders of Southern Africa* (1978), pp. 137–147; and LEROY VAIL (ed.), *The Creation of Tribalism in Southern Africa* (1989). REGINALD H. GREEN *et al., Children on the Front Line: The Impact of Apartheid, Destabilization, and Warfare on Children in Southern and South Africa,* 3rd ed. (1989), reviews the position of children in the region in the context of war with reference to lives lost and GDP eroded as well as health service and nutrition issues. (J.R.De.)

The economy: Aspects of the southern African economy, including agriculture, policies, and development, are treated in *Survey of Economic and Social Conditions in Africa* (annual), a United Nations publication; RALPH A. AUSTEN, *African Economic History: Internal Development and External Dependency* (1987); ROGER RIDDELL *et al., Manufacturing Africa: Performance & Prospects of Seven Countries in Sub-Saharan Africa* (1990); HANS BINSWANGER and PRABHU PINGALI, "Technological Priorities for Farming in Sub-Saharan Africa," *Journal of International Development,* 1(1):46–65 (January 1989); *Sub-Saharan Africa: From Crisis to Sustainable Growth: A Long-term Perspective Study* (1989), a World Bank publication; ALLAN LOW, *Agricultural Development in Southern Africa: Farm-Household Economics and the Food Crisis* (1986); and JOSEPH HANLON, *SADCC in the 1990s: Development on the Front Line* (1989). ROBIN PALMER and NEIL PARSONS (eds.), *The Roots of Rural Poverty in Central and Southern Africa* (1977), contains key essays on the region's political economy in the 19th and 20th centuries. (J.B.S./H.Za.)

History. *General works:* J.D. FAGE and ROLAND OLIVER, *The Cambridge History of Africa,* 8 vol. (1975–86), has long chapters on southern Africa by leading authorities and places southern Africa in the context of African history; a more condensed attempt is provided by PHILIP CURTIN *et al., African History* (1978). UNESCO INTERNATIONAL SCIENTIFIC COMMITTEE FOR THE DRAFTING OF A GENERAL HISTORY OF AFRICA, *General History of Africa,* 8 vol. (1981–93), is an international collaborative effort that locates African people and their experience at the centre and portrays African contact with Middle Eastern, Asian, and Euro-American people in the larger context of African history. NEIL PARSONS, *A New History of Southern Africa,* 2nd ed. (1993), is an introductory text dealing with the region as a whole. DAVID BIRMINGHAM and PHYLLIS MARTIN (eds.), *History of Central Africa,* 2 vol. (1983), contains essays on topics in central and southern African history. A.J. WILLS, *An Introduction to the History of Central Africa: Zambia, Malawi, and Zimbabwe,* 4th ed. (1985), is still a useful guide to British south-central Africa. LEROY VAIL and LANDEG WHITE, *Power and the Praise Poem: Southern African Voices in History* (1991), signals a major turning point in the interpretation of southern Africa's past by insisting on the centrality of African interpretations through poetry, performance, and other oral expressions. Current research can be found in such specialist journals as *Journal of African History* (3/yr); *Journal of Southern African Studies* (quarterly); and *African Affairs* (quarterly).

Southern Africa to 1800: D.W. PHILLIPSON, *African Archaeology,* 2nd ed. (1993), is an introductory text with coverage ranging from prehistoric times to European contact. Overviews of early societies are found in R.R. INSKEEP, *The Peopling of Southern Africa* (1978); and D.W. PHILLIPSON, *The Later Prehistory of Eastern and Southern Africa* (1977), which both deal with the Late Stone Age and the Iron Age; and PETER S. GARLAKE, *The Kingdoms of Africa* (1978, reissued 1990), an excellent introduction to the Iron Age in southern Africa, and *Great Zimbabwe* (1973). GRAHAM CONNAH, *African Civilizations: Precolonial Cities and States in Tropical Africa: An Archaeological Perspective* (1987), discusses the period of Great Zimbabwe's influence (*c.* 1250–1450) and Bantu occupation of east coast areas from the end of the 1st millennium AD. MARTIN HALL, *The Changing Past: Farmers, Kings, and Traders in Southern Africa, 200–1860* (1987; also published as *Farmers, Kings, and Traders,* 1990), offers an overview of southern African history and archaeology, starting with the first settlement of the subcontinent. Portuguese ventures in west-central and east-central Africa are chronicled in EDWARD A. ALPERS, *Ivory and Slaves* (also published as *Ivory & Slaves in East Central Africa,* 1975); DAVID BIRMINGHAM, *Trade and Conflict in Angola: The Mbundu and Their Neighbours Under the Influence of the Portuguese, 1483–1790* (1966); JOSEPH C. MILLER, *Kings and Kinsmen: Early Mbundu States in Angola* (1976); C.R. BOXER, *Race Relations in the Portuguese Colonial Empire, 1415–1825* (1963, reprinted 1985); JAN VANSINA, *Kingdoms of the Savanna* (1966); and PHYLLIS M. MARTIN, *The External Trade of the Loango Coast, 1576–1870* (1972).

Southern Africa, 1800–c. 1900: DONALD DENOON and BALAM NYEKO, *Southern Africa Since 1800,* new ed. (1984), is a good overview. The Mfecane and its effects are analyzed in J.D. OMER-COOPER, *The Zulu Aftermath* (1966, reissued 1978), the standard account covering southern, central, and eastern Africa, the findings of which have been modified by detailed regional research. A stimulating account of the colonial period can be found in MARTIN CHANOCK, *Law, Custom, and Social Order: The Colonial Experience in Malawi and Zambia* (1985). British policy and the expansion of European settlement south of the Limpopo River is addressed in JOHN S. GALBRAITH, *Reluctant Empire: British Policy on the South African Frontier, 1834–1854* (1963, reprinted 1978); and DAVID WELSH, *The Roots of Segregation: Native Policy in Colonial Natal, 1845–1910* (1971). Attempts to look at the African side in this period include ROBERT ROSS, *Adam Kok's Griquas: A Study in the Development of Stratification in South Africa* (1976); and NORMAN ETHERINGTON, *Preachers, Peasants, and Politics in Southeast Africa, 1835–80: African Christian Communities in Natal, Pondoland, and Zululand* (1978). The era of mineral discoveries and the scramble for southern Africa are the subject of C.W. DE KIEWIET, *The Imperial Factor in South Africa* (1937, reissued 1966); applicable chapters in RONALD ROBINSON, JOHN GALLAGHER, and ALICE DENNY, *Africa and the Victorians: The Official Mind of Imperialism,* 2nd ed. (1981); D.M. SCHREUDER, *The Scramble for Southern Africa, 1877–1895* (1980), a synthesis of the subject; J.S. MARAIS, *The Fall of Kruger's Republic* (1961); and DONALD DENOON, *A Grand Illusion: The Failure of Imperial Policy in the Transvaal Colony During the Period of Reconstruction, 1900–1905* (1973). A critique of the literature on British policy in South Africa can be found in ANTHONY ATMORE and SHULA MARKS, "The Imperial Factor in South Africa: Towards a Reassessment," *Journal of Imperial and Commonwealth History* (October 1974). The scramble in central Africa and the establishment of colonial society are dealt with in JOHN S. GALBRAITH, *Crown and Charter: The Early Years of the British South Africa Company* (1974); and IAN PHIMISTER, "Rhodes, Rhodesia, and the Rand," *Journal of Southern African Studies,* vol. 1, no. 1 (1974), a radical reinterpretation of the connections. Events in Angola and Mozambique are outlined in MALYN NEWITT, *Portugal in Africa: The Last Hundred Years* (1981), a lucid overview with a synopsis of the earlier period of Portuguese rule; and GERVASE CLARENCE-SMITH, *The Third Portuguese Empire, 1825–1975* (1985), an overview from an economic perspective. German activity in South West Africa is discussed in PROSSER GIFFORD, W.M. ROGER LOUIS, and ALISON SMITH (eds.), *Britain and Germany in Africa* (1967); and HORST DRECHSLER, *Let Us Die Fighting: The Struggle of the Herero and Nama Against German Imperialism (1884–1915)* (1980; originally published in German, 1966).

Southern Africa, c. 1900 to the present: MARTIN CHANOCK, *Britain, Rhodesia, and South Africa, 1900–45* (also published as *Unconsummated Union,* 1977), contains a masterly account of interregional politics. Coverage of more recent events from differing viewpoints can be found in BASIL DAVIDSON, JOE SLOVO, and ANTHONY WILKINSON, *Southern Africa: The New Politics of Revolution* (1976), on the struggle in the Portuguese colonies, South Africa, and Rhodesia following the Portuguese coup of 1974. Coverage of various countries during this period is found in LORD HAILEY (WILLIAM MALCOLM HAILEY, BARON HAILEY), *Native Administration in the British African Territories,* 5 vol. (1950–53, reprinted 5 vol. in 3, 1979), and *The Republic of South Africa and the High Commission Territories* (1963, reprinted 1982); RICHARD GRAY, *The Two Nations: Aspects of the Development of Race Relations in the Rhodesias and Nyasaland* (1960, reprinted 1974); ROBERT I. ROTBERG, *The Rise of Nationalism in Central Africa: The Making of*

Malawi and Zambia, 1873–1964 (1965); CHARLES PERRINGS, *Black Mineworkers in Central Africa: Industrial Strategies and the Evolution of an African Proletariat in the Copperbelt, 1911–41* (1979); and PATRICK KEATLEY, *The Politics of Partnership* (1963), on Rhodesia and Nyasaland. (Sh.M.)

Angola. Overviews are provided by DOUGLAS L. WHEELER and RENÉ PÉLISSIER, *Angola* (1971); and THOMAS COLLELO (ed.), *Angola, a Country Study,* 3rd ed. (1991). MANFRED KUDER, *Angola: eine geographische, soziale, und wirtschaftliche Landeskunde* (1971), is the standard geographic text. LAWRENCE W. HENDERSON, *A Igreja em Angola* (1990), surveys the Christian groups. The best up-to-date information on politics and the economy is provided by two publications from the Economist Intelligence Unit, *Country Profile: Angola, São Tomé & Príncipe* (annual), and *Country Report: Angola, São Tomé & Príncipe* (quarterly). *Angola, an Introductory Economic Review* (1991), a World Bank publication, is also useful.

LAWRENCE W. HENDERSON, *Angola: Five Centuries of Conflict* (1979), provides a broad treatment. PHYLLIS M. MARTIN, *Historical Dictionary of Angola* (1980), includes a bibliography. DAVID BIRMINGHAM, *Central Africa to 1870: Zambezia, Zaïre, and the South Atlantic* (1981), synthesizes prehistory and the early Portuguese presence. More on the Portuguese presence can be found in GERALD J. BENDER, *Angola Under the Portuguese: The Myth and the Reality* (1978). Analyses of the slave trade include JOSEPH C. MILLER, *Way of Death: Merchant Capitalism and the Angolan Slave Trade, 1730–1830* (1988), a masterful work; and W.G. CLARENCE-SMITH, *Slaves, Peasants, and Capitalists in Southern Angola, 1840–1926* (1979). RENÉ PÉLISSIER, *Les Guerres grises: résistance et révoltes en Angola, 1845–1941* (1977), reviews modern history from a military and political perspective. JOHN A. MARCUM, *The Angolan Revolution,* 2 vol. (1969–78), analyzes the liberation movements up to independence. HENRIQUE GUERRA, *Angola: estrutura económica e classes sociais,* 4th ed. (1979), is an essay on late colonial reforms. DAVID BIRMINGHAM, *Frontline Nationalism in Angola & Mozambique* (1992), focuses on the period from 1961 to 1975. F.W. HEIMER, *The Decolonization Conflict in Angola, 1974–76: An Essay in Political Sociology* (1979), provides the best guide to decolonization. W.G. CLARENCE-SMITH, "Class Structure and Class Struggles in Angola in the 1970s," *Journal of Southern African Studies,* 7(1):109–126 (October 1980), analyzes the beginnings of the civil war. FRED BRIDGLAND, *Jonas Savimbi: A Key to Africa* (1986), views the civil war from a UNITA perspective; while KEITH SOMERVILLE, *Angola: Politics, Economics, and Society* (1986), does the same from an MPLA perspective. WILLIAM MINTER, *Apartheid's Contras: An Inquiry into the Roots of War in Angola and Mozambique* (1994), also discusses the recent civil wars. (W.G.C.-S./Ed.)

Botswana. ROBSON M.K. SILITSHENA and G. MCLEOD, *Botswana: A Physical, Social, and Economic Geography* (1989), briefly but authoritatively covers all aspects of Botswana's geography from climate to patterns of human settlement. *Botswana Notes and Records* (annual), is a scholarly journal covering research in natural and social science and in humanities. BOTSWÁNA SOCIETY, *The Botswana Society Social Studies Atlas* (1988), contains maps of the country's physical and human geography and history as well as environmental and thematic maps of the southern African region. Studies of the plant and animal life include RONALD DANIEL AUERBACH, *The Amphibians and Reptiles of Botswana* (1987); MICHAEL MAIN, *Kalahari: Life's Variety in Dune and Delta* (1987), a popular survey of recent scientific research on the natural and human aspects of the desert from prehistory to future prospects; KENNETH NEWMAN, *Newman's Birds of Botswana* (1989); MARK OWENS and DELIA OWENS, *Cry of the Kalahari* (1984); KAREN ROSS, *Okavango: Jewel of the Kalahari* (1987), an illustrated description of wetland wildlife and the environment of the delta; and DAVID S.G. THOMAS and PAUL A. SHAW, *The Kalahari Environment* (1991), an extensive scholarly study of the Kalahari Basin, detailing present geology, tectonics, climate, and vegetation and discussing the findings of recent research on prehistoric lakes and rivers from the Cretaceous to the Quaternary as well as presenting current debate on land use and water resources. TORE JANSON and JOSEPH TSONOPE, *Birth of a National Language: The History of Setswana* (1991), traces the development of a standardized national dialect beginning in the 19th century to the increasing distinction since the 1960s between Botswana and South African official Setswana. Studies of the people include LAURENS VAN DER POST and JANE TAYLOR, *Testament to the Bushmen* (1984); BESSIE HEAD, *Serowe, Village of the Rainwind* (1981), a novelist's view of local social history based on interviews; and DIANA WYLIE, *A Little God: The Twilight of Patriarchy in a Southern African Chiefdom* (1990), a historian's view of disappearing chieftainship. The economy is addressed in CHRISTOPHER COLCLOUGH and STEPHEN MCCARTHY, *The Political Economy of Botswana: A Study of Growth and Distribution* (1980), a scholarly survey of economic development, 1965–77; CHARLES HARVEY and STEPHEN R. LEWIS, JR., *Policy Choice and Development Performance in Botswana* (1990), an analysis of the successful government negotiation of terms with mining companies and the management of the resulting financial surplus; JOHN HOLM and PATRICK MOLUTSI (eds.), *Democracy in Botswana* (1989), a collection of symposium proceedings that emphasizes the adaptation of indigenous institutions, the roles of bureaucrats and foreign capital, the group rights of cultural minorities, and the efficacy of regular general elections; and LOUIS A. PICARD, *The Politics of Development in Botswana: A Model for Success?* (1987).

Historical treatments include THOMAS TLOU and ALEC CAMPBELL, *History of Botswana* (1984); FRED MORTON, ANDREW MURRAY, and JEFF RAMSAY, *Historical Dictionary of Botswana,* new ed. (1989), a reference work with an excellent bibliography; FRED MORTON and JEFF RAMSAY (eds.), *The Birth of Botswana: A History of the Bechuanaland Protectorate from 1910 to 1966* (1987), on the rise and fall of powerful local sovereignties headed by chiefs under colonial rule; MICHAEL CROWDER, *The Flogging of Phineas McIntosh: A Tale of Colonial Folly and Injustice: Bechuanaland, 1933* (1988); LOUIS A. PICARD (ed.), *The Evolution of Modern Botswana* (1985), the country's administrative history from the 1930s to postcolonial development; MICHAEL DUTFIELD, *A Marriage of Inconvenience: The Persecution of Ruth and Seretse Khama* (1990); JACK PARSON (ed.), *Succession to High Office in Botswana: Three Case Studies* (1990); and JACK PARSON, *Botswana: Liberal Democracy and the Labor Reserve in Southern Africa* (1984). (Ne.P.)

Lesotho. COLIN MURRAY, *Families Divided: The Impact of Migrant Labour in Lesotho* (1981), studies the effects of shifting labour migration on family life in three different villages. WILLIAM F. LYE and COLIN MURRAY, *Transformations on the Highveld: The Tswana & Southern Sotho* (1980), studies these people who live in Lesotho, Botswana, and central South Africa. The economy and government policies are discussed in JOHN E. BARDILL and JAMES H. COBBE, *Lesotho: Dilemmas of Dependence in Southern Africa* (1985); and JAMES FERGUSON, *The Anti-Politics Machine: "Development," Depoliticization, and Bureaucratic Power in Lesotho* (1990).

The history of the country is analyzed by STEPHEN J. GILL, *A Short History of Lesotho: From the Late Stone Age Until the 1993 Elections* (1993); ROBERT C. GERMOND (compiler and trans.), *Chronicles of Basutoland* (1967), a running commentary by French missionaries of the period 1830–1902; ELIZABETH A. ELDREDGE, *A South African Kingdom: The Pursuit of Security in Nineteenth-Century Lesotho* (1993); LEONARD THOMPSON, *Survival in Two Worlds: Moshoeshoe of Lesotho, 1786–1870* (1975); and PETER SANDERS, *Moshoeshoe, Chief of the Sotho* (1975), both analyzing Moshoeshoe's role in events; L.B.B.J. MACHOBANE, *Government and Change in Lesotho, 1800–1966: A Study of Political Institutions* (1990); and B.M. KHAKETLA, *Lesotho, 1970: An African Coup Under the Microscope* (1971). An excellent, comprehensive guide to the published material on Lesotho up to the time of publication is SHELAGH M. WILLET and DAVID P. AMBROSE, *Lesotho: A Comprehensive Bibliography* (1980). (J.J.Gu./Ed.)

Malaŵi. Overviews of the country can be found in HAROLD D. NELSON *et al., Area Handbook for Malawi* (1975, reprinted 1987). SWANZIE AGNEW and MICHAEL STUBBS (eds.), *Malawi in Maps* (1972); and MALAŴI DEPT. OF SURVEYS, *The National Atlas of Malaŵi* (1983?), present the country's physical characteristics and natural and human resources in cartographic form. MARGARET READ, *The Ngoni of Nyasaland* (1956, reissued 1970); and T. CULLEN YOUNG, *Notes on the History of the Tumbuka-Kamanga Peoples in the Northern Province of Nyasaland,* 2nd ed. (1970), are ethnographic studies. HORST DEQUIN, *Agricultural Development in Malawi* (1969), is a historical study of the period between 1890 and 1967. Economic conditions and politics are discussed in CAROLYN MCMASTER, *Malawi: Foreign Policy and Development* (1974); and T. DAVID WILLIAMS, *Malawi: The Politics of Despair* (1978).

Works chronicling the country's history are JOHN G. PIKE, *Malawi: A Political and Economic History* (1968); B.R. RAFAEL, *A Short History of Malawi,* 3rd ed. (1985); OWEN J.M. KALINGA, *A History of the Ngonde Kingdom of Malawi* (1985); BRIDGLAL PACHAI, *Malawi: The History of the Nation* (1973), and *Land and Politics in Malawi, 1875–1975* (1978); BRIDGLAL PACHAI (ed.), *The Early History of Malawi* (1972); JOHN MCCRACKEN, *Politics and Christianity in Malawi, 1875–1940: The Impact of the Livingstonia Mission in the Northern Province* (1977); RODERICK J. MACDONALD (ed.), *From Nyasaland to Malawi: Studies in Colonial History* (1975); IAN LINDEN and JANE LINDEN, *Catholics, Peasants, and Chewa Resistance in Nyasaland, 1889–1939* (1974); GEORGE SHEPPERSON and THOMAS PRICE, *Independent African: John Chilembwe and the Origins, Setting, and Significance of the Nyasaland Native Rising of 1915* (1958, reissued 1987); and PHILIP SHORT, *Banda* (1974).

(Z.D.K./K.M.G.P./J.C.Mi./K.In./Ed.)

Mozambique. HAROLD D. NELSON (ed.), *Mozambique, a Country Study,* 3rd ed. (1985), provides coverage of politics, security, economics, and society. REPÚBLICA POPULAR DE MOÇAMBIQUE, MINISTÉRIO DA EDUCAÇÃO, *Atlas Geográfico,* vol. 1, 2nd ed., rev. and updated (1986), is a useful geographic tool. *Country Profile: Mozambique* (annual), published by the Economist Intelligence Unit, contains accurate, up-to-date information on the economy, resources, and industry. STEPHANIE URDANG, *And Still They Dance: Women, War, and the Struggle for Change in Mozambique* (1989), highlights women's historical gains and their present struggles in the face of war and economic collapse. LINA MAGAIA, *Dumba Nengue: Run for Your Life: Peasant Tales of Tragedy in Mozambique* (1988; originally published in Portuguese, 1987), comprises a collection of testimony of the terror experienced by rural Mozambicans at the hands of Renamo. RUTH FIRST, *Black Gold: The Mozambican Miner, Proletarian, and Peasant* (1983), is a classic study of the country's historically most important flow of migrant labour from southern Mozambique to South Africa's gold mines. KEITH MIDDLEMAS, *Cabora Bassa: Engineering and Politics in Southern Africa* (1975), is a detailed study of the conceptualization, financing, and construction of one of the world's largest hydroelectric projects. *The Emergency Situation in Mozambique: Priority Requirements for the Period 1990–1991* (1990), prepared by the Mozambique government in collaboration with the United Nations, summarizes contemporary problems and development strategies.

Mozambique's history to independence is chronicled in MALYN NEWITT, *Portuguese Settlement on the Zambesi* (1973), and *A History of Mozambique* (1995); ALLEN F. ISAACMAN, *Mozambique: The Africanization of a European Institution: The Zambesi Prazos, 1750–1902* (1972); ALLEN F. ISAACMAN and BARBARA ISAACMAN, *The Tradition of Resistance in Mozambique* (1976), covering 1850–1921, and *Mozambique: From Colonialism to Revolution, 1900–1982* (1983); RENÉ PÉLISSIER, *Naissance du Mozambique: résistance et révoltes anticoloniales (1854–1918),* 2 vol. (1984), the most detailed source for the late slave era and conquest; LEROY VAIL and LANDEG WHITE, *Capitalism and Colonialism in Mozambique: A Study of Quelimane District* (1980), an excellent study of the colonial experience in Mozambique; THOMAS H. HENRIKSEN, *Revolution and Counterrevolution: Mozambique's War of Independence, 1964–1974* (1983), the most complete study in English of the independence struggle; and EDUARDO MONDLANE, *The Struggle for Mozambique* (1969, reissued 1983), a classic study of Mozambique's struggle to overcome colonial domination, written by the first president of Frelimo. Additional coverage of Mozambique can be found in the books by Birmingham and Minter, cited in the Angola section above. Works analyzing the revolution and subsequent events include JOSEPH HANLON, *Mozambique: The Revolution Under Fire* (1984, reprinted 1990), a sympathetic review of Frelimo's efforts to build a more egalitarian society, and *Mozambique: Who Calls the Shots?* (1991), a study of the country's economic and administrative near-collapse in the face of Renamo assaults, drought, and population displacement; ALEX VINES, *Renamo: Terrorism in Mozambique* (1991), a complete investigation of the organization's people, power structure, and international support networks; and WILLIAM FINNEGAN, *A Complicated War: The Harrowing of Mozambique* (1992), emphasizing the complex internal relationships which, along with the international dynamic of destabilization and military assaults in the country since independence, have fueled the destruction. COLIN DARCH and CALISTO PACHELEKE, *Mozambique* (1987), is an excellent annotated bibliography on all aspects of the country. (J.M.Pe./Ed.)

Namibia. BRIAN WOOD, *Namibia, 1884–1984: Readings on Namibia's History and Society* (1988), is a collection of somewhat uneven chapters on historical, social, and economic aspects. J.H. VAN DER MERWE (ed.), *National Atlas of South West Africa* (1983), is a detailed study of all aspects of Namibia's geography. RICHARD MOORSOM, "Underdevelopment, Contract Labor, and Worker Consciousness in Namibia, 1915–1972," *Journal of Southern African Studies,* 17:71–82 (October 1977), analyzes the nature, context, goals, and evolution of Namibian workers. UNITED NATIONS INSTITUTE FOR NAMIBIA, *Namibia: Perspectives for National Reconstruction and Development* (1986), brings together data and option analysis on most social, political, and economic aspects, although the policy advice is dated because it did not forecast reconciliation. DAVID SIMON and RICHARD MOORSOM, "Namibia's Political Economy: A Contemporary Perspective," in GERHARD TÖTEMEYER, VEZERA KANDETU, and WOLFGANG WERNER (eds.), *Namibia in Perspective* (1987), pp. 82–101, reviews the territorial economy, then approaching its low point. REGINALD H. GREEN, KIMMO KILJUNEN, and MARJA-LIISA KILJUNEN, *Namibia: The Last Colony* (1981), emphasizes the economy and the political-economic process. TORE LINNÉ ERIKSEN and RICHARD MOORSOM, *The Political Economy of Namibia: An Annotated Critical Bibliography,* 2nd ed. (1989), covers and comments on virtually all substantive material through 1988.

H. BLEY, *South-West Africa Under German Rule, 1894–1914* (1971; originally published in German, 1968), is a major study of the German occupation era with some coverage of the pre-colonial period. PETER H. KATJAVIVI, *A History of Resistance in Namibia* (1988), is a major study of Namibian history, especially from 1860 through the mid-1980s. REGINALD H. GREEN and P. MANNING, "Namibia: Preparations for Destabilization," in PHYLLIS JOHNSON and DAVID MARTIN, *Frontline Southern Africa: Destructive Engagement* (1988), pp. 153–189, gives an overview of the post-World War II liberation effort to the late 1980s. SWAPO DEPT. OF INFORMATION AND PUBLICITY, *To Be Born a Nation: The Liberation Struggle for Namibia* (1981), states the position, goals, and perception of history by the then-main nationalist movement, now the majority party. COLIN LEYS and JOHN S. SAUL, *Namibia's Liberation Struggle: The Two-Edged Sword* (1995), provides coverage of the recent liberation war and early years of independence. DAVID SIMON, *Independent Namibia: One Year On* (1991), is a review through early 1991; it may be supplemented by DONALD L. SPARKS and DECEMBER GREEN, *Namibia: The Nation After Independence* (1992). (R.H.Gr./Ed.)

South Africa. HAROLD D. NELSON (ed.), *South Africa, a Country Study* (1981), surveys South African society, economy, politics, and geography. *South African Review* (irregular); and *Race Relations Survey* (annual) document developments in politics, economy, and society. MONICA COLE, *South Africa,* 2nd ed. (1966), is a basic, comprehensive physical and human geography. SOUTH AFRICA DIRECTORATE OF SURVEYS AND MAPPING, *Reader's Digest Atlas of Southern Africa* (1984), despite its title, covers only South Africa in maps, photographs, and diagrams. An introduction to the social structure and politics of the country is BERNARD MAGUBANE, *The Political Economy of Race and Class in South Africa* (1978). DAVID M. SMITH (ed.), *The Apartheid City and Beyond* (1992); and MARK SWILLING, RICHARD HUMPHRIES, and KHEHLA SHUBANE (eds.), *Apartheid City in Transition* (1991), are collections of essays on urbanization, social change, urban politics, and development. Historical studies of the economy include ROBERT H. DAVIES, *Capital, State, and White Labour in South Africa, 1900–1960* (1979); and BELINDA BOZZOLI, *The Political Nature of a Ruling Class: Capital and Ideology in South Africa, 1890–1933* (1981). Contemporary economic conditions are treated in JILL NATTRASS, *The South African Economy: Its Growth and Change,* 2nd ed. (1988); NICOLI NATTRASS and ELISABETH ARDINGTON (eds.), *The Political Economy of South Africa* (1990); FRANCIS WILSON and MAMPHELA RAMPHELE, *Uprooting Poverty: The South African Challenge* (1989), a study of income distribution and aspects of poverty and unemployment; STEPHEN R. LEWIS, JR., *The Economics of Apartheid* (1990), an excellent review; and MERLE LIPTON and DAVID HAUCK (eds.), *The Impact of Sanctions on South Africa,* 2 vol. (1990). DEON GELDENHUYS, *The Diplomacy of Isolation: South African Foreign Policy Making* (1984), outlines government policies. (A.S.Ma.)

Broad coverage of South Africa's history is provided in MONICA WILSON and LEONARD THOMPSON (eds.), *The Oxford History of South Africa,* 2 vol. (1969–71), the only general reference work to make a serious attempt to record the history of all the peoples of South Africa; C.W. DE KIEWIET, *A History of South Africa, Social & Economic* (1941, reprinted 1978); LEONARD THOMPSON, *A History of South Africa* (1990), fluent and elegantly written; T.R.H. DAVENPORT, *South Africa: A Modern History,* 4th ed., updated and rev. (1991); and PAUL MAYLAM, *A History of the African People of South Africa: From the Early Iron Age to the 1970s* (1986), an overview for the nonspecialist of the history of African societies in South Africa. CHERRYL WALKER (ed.), *Women and Gender in Southern Africa to 1945* (1990), discusses the changing status of women in the past 100 years.

Early history to 1770 is explored in RICHARD ELPHICK, *Kraal and Castle* (1977; also published as *Khoikhoi and the Founding of White South Africa,* 1985), a detailed study of the interactions between the Dutch at the Cape of Good Hope and the Khoikhoi chiefdoms of the region; RICHARD ELPHICK and HERMANN GILIOMEE (eds.), *The Shaping of South African Society, 1652–1840* (1989), essays that review the history comprehensively from the first years of Dutch settlement; and S. DANIEL NEUMARK, *Economic Influences on the South African Frontier, 1652–1836* (1957). DAVID LEWIS-WILLIAMS and THOMAS DOWSON, *Images of Power: Understanding Bushman Rock Art* (1989), is an introduction to the rock paintings of southern Africa.

There is still no good published overview account of the period 1770–1870 in South African history, and there are still enormous gaps in knowledge. Nevertheless, the following titles are useful: CLIFTON C. CRAIS, *White Supremacy and Black Resistance in Pre-industrial South Africa: The Making of the Colonial Order in the Eastern Cape, 1770–1865* (1992); BEN MACLENNAN, *A Proper Degree of Terror: John Graham and the*

Cape's Eastern Frontier (1986), a study of the colonial invasion of the Zuurveld in 1811–12; W.M. MACMILLAN, *Bantu, Boer, and Briton: The Making of the South African Native Problem,* rev. and enlarged ed. (1963, reprinted 1978), a classic, still useful for the period 1820–40; PETER DELIUS, *The Land Belongs to Us: The Pedi Polity, the Boers, and the British in the Nineteenth-Century Transvaal* (1983); ROBERT ROSS, *Cape of Torments: Slavery and Resistance in South Africa* (1983); NIGEL WORDEN, *Slavery in Dutch South Africa* (1985); NOËL MOSTERT, *Frontiers: The Epic of South Africa's Creation and the Tragedy of the Xhosa People* (1992); JULIAN COBBING, "The Mfecane as Alibi: Thoughts on Dithakong and Mbolompo," *Journal of African History,* 29(3):487–519 (1988), arguing that the "Mfecane" is a species of colonial mythology; R. KENT RASMUSSEN, *Migrant Kingdom: Mzilikazi's Ndebele in South Africa* (1978), to the 1830s; J.B. PEIRES, *The House of Phalo: A History of the Xhosa People in the Days of Their Independence* (1981), up to the 1840s, and *The Dead Will Arise: Nongqawuse and the Great Xhosa Cattle-Killing Movement of 1856–7* (1989); COLIN BUNDY, *The Rise and Fall of the South African Peasantry,* 2nd ed. (1988), on the emergence of the African peasants after the 1840s; JEFF GUY, *The Destruction of the Zulu Kingdom: The Civil War in Zululand, 1879–1884* (1979), mainly on the British invasion of 1879 and its aftermath; and SHULA MARKS and ANTHONY ATMORE (eds.), *Economy and Society in Pre-industrial South Africa* (1980), essays on the pre-1900 period.

The period 1870–1930 is dealt with in H.J. SIMONS and R.E. SIMONS, *Class and Colour in South Africa, 1850–1950* (1969, reprinted 1983); WILLIAM H. WORGER, *South Africa's City of Diamonds: Mine Workers and Monopoly Capitalism in Kimberley, 1867–1895* (1987), a history of diamond mining, paying particular attention to questions of labour recruitment and the rise of the De Beers Mining Company; SHULA MARKS and RICHARD RATHBONE, *Industrialisation and Social Change in South Africa: African Class Formation, Culture, and Consciousness, 1870–1930* (1982), a collection of essays exploring some of the consequences of an industrial revolution for the country's African population; FREDERICK A. JOHNSTONE, *Class, Race, and Gold* (1976, reprinted 1987), an influential Marxist study of how racial discrimination was institutionalized in the gold-mining industry; T.R.H. DAVENPORT, *The Afrikaner Bond: The History of a South African Political Party, 1880–1911* (1966); CHARLES VAN ONSELEN, *Studies in the Social and Economic History of the Witwatersrand, 1886–1914,* 2 vol. (1982), a fine social history; THOMAS PAKENHAM, *The Boer War* (1979), a highly readable, well-researched popular history; PETER WARWICK (ed.), *The South African War* (1980); SHULA MARKS and STANLEY TRAPIDO, "Lord Milner and the South African State," *History Workshop,* 8:50–80 (Autumn 1979), an important article that led to the reevaluation of Milner's role in South Africa; LEONARD THOMPSON, *The Unification of South Africa, 1902–1910* (1960); DAVID YUDELMAN, *The Emergence of Modern South Africa: State, Capital, and the Incorporation of Organized Labor on the South African Gold Fields, 1902–1939* (1983); PETER WALSHE, *The Rise of African Nationalism in South Africa: The African National Congress, 1912–1952* (1970); HELEN BRADFORD, *A Taste of Freedom: The ICU in Rural South Africa, 1924–1930* (1987); GAIL M. GERHART, *Black Power in South Africa: The Evolution of an Ideology* (1978); and KEN LUCKHARDT and BRENDA WALL, *Organize or Starve!: The History of the South African Congress of Trade Unions* (1980).

South African history since 1930 is chronicled in numerous books. Recent syntheses of value include WILLIAM BEINART, *Twentieth-Century South Africa* (1994); and NIGEL WORDEN, *The Making of Modern South Africa: Conquest, Segregation, and Apartheid* (1994). JONATHAN CRUSH, ALAN JEEVES, and DAVID YUDELMAN, *South Africa's Labor Empire: A History of Black Migrancy to the Gold Mines* (1991), deals with the ways in which the history of the region has been connected through labour migrancy. FRANCIS WILSON, *Labour in the South African Gold Mines, 1911–1969* (1972), describes the dependence of South Africa's premier industry on African migrant workers and shows how the mining groups held down miners' wages so that they were lower in 1969 than in 1911. T. DUNBAR MOODIE, *The Rise of Afrikanerdom: Power, Apartheid, and the Afrikaner Civil Religion* (1975), shows how an Afrikaner civil religion, with antecedents going back to the 19th century, contributed to the political victory of the Afrikaner National Party in 1948. LEONARD THOMPSON, *The Political Mythology of Apartheid* (1985), shows with specific examples how the mythology of the Afrikaner nationalist movement was originally a mythology of liberation from British colonialism, but as British power waned it legitimated the oppression of the black people of South Africa. HERIBERT ADAM and HERMANN GILIOMEE, *Ethnic Power Mobilized: Can South Africa Change?* (1979), finds the roots of apartheid not in ideological racism or prejudiced Calvinism but in the entrenchment of Afrikaner power and privilege, mobilized against both black competitors and imperial foreign capital. DAN O'MEARA, *Volkskapitalisme: Class, Capital, and Ideology in the Development of Afrikaner Nationalism, 1934–1948* (1983), provides a useful account of a crucial period. MERLE LIPTON, *Capitalism and Apartheid: South Africa, 1910–84* (1985), explores, from a conservative perspective, the interaction of racial politics and economic interests in South Africa, especially in the years 1960–85, showing how capitalists who opposed apartheid became more influential after 1960. SHULA MARKS and STANLEY TRAPIDO (eds.), *The Politics of Race, Class, and Nationalism in Twentieth-century South Africa* (1987), collects essays by the "revisionist" or Marxist school of African historians emphasizing class conflict and capital accumulation. The essays in HERMANN GILIOMEE and LAWRENCE SCHLEMMER (eds.), *Up Against the Fences: Poverty, Passes, and Privilege in South Africa* (1985), describe the forces leading to the massive migration of Africans from the reserves to the cities and show that the government was failing to stop it. DAVID PALLISTER, SARAH STEWART, and IAN LEPPER, *South Africa Inc.: The Oppenheimer Empire,* rev. and updated ed. (1988), describes the global reach of the great industrial and financial conglomerate centred in the Anglo-American Corporation and the De Beers diamond cartel. JOSEPH HANLON, *Beggar Your Neighbours: Apartheid Power in Southern Africa* (1986), details how, during the 1980s, South African economic, political, and military power was used to destabilize other countries in southern Africa. WILLIAM MINTER, *King Solomon's Mines Revisited: Western Interests and the Burdened History of Southern Africa* (1986), offers a radical critique of the involvement of Britain, the United States, and other Western powers and financial interests in the exploitation of the black people of southern Africa. TOM LODGE, *Black Politics in South Africa Since 1945* (1983), is the basic history of black protest movements since World War II, with detailed examinations of specific campaigns and episodes. THOMAS KARIS and GWENDOLEN M. CARTER, *From Protest to Challenge: A Documentary History of African Politics in South Africa, 1882–1964,* 4 vol. (1972–77), is useful especially for its elaborate introductions; vol. 4 contains biographical sketches of major black politicians. SEBASTIAN MALLABY, *After Apartheid: The Future of South Africa* (1992), explores the options. DAVID OTTAWAY, *Chained Together: Mandela, De Klerk, and the Struggle to Remake South Africa* (1993), traces the common commitment of the white and black leaders to the transformation of South Africa. JACKLYN COCK, *Colonels & Cadres: War & Gender in South Africa* (1991; also published as *Women and War in South Africa,* 1993), explores the link between war and gender in South Africa in the final apartheid years. HERIBERT ADAM and KOGILA MOODLEY, *The Opening of the Apartheid Mind: Options for the New South Africa* (1993), provides a cogent analysis of the complex forces that operate in the new South Africa.

(M.Hl./J.R.D.C./C.J.B./L.M.T./Sh.M.)

Swaziland. The physical and human geography of the country are described in *Social Studies Atlas for Swaziland* (1991); G. MURDOCH, *Soils and Land Capability in Swaziland* (1968); ROBERT HAROLD COMPTON, *The Flora of Swaziland* (1976); BRIAN ALLAN MARWICK, *The Swazi* (1940, reissued 1966), an ethnographic account; HILDA KUPER, *An African Aristocracy: Rank Among the Swazi* (1947), on the social life and institutions of the Swazi; *Report on the 1986 Swaziland Population Census,* vol. 4, *Analytical Report* (1991?); D.C. FUNNELL, *Under the Shadow of Apartheid: Agrarian Transformation in Swaziland* (1991); CHRISTIAN P. POTHOLM, *Swaziland: The Dynamics of Political Modernization* (1972); and ALAN R. BOOTH, *Swaziland: Tradition and Change in a Southern African Kingdom* (1983).

Historical works include DAVID PRICE WILLIAMS, "Archaeology in Swaziland," *South African Archaeological Bulletin,* 35(131):13–18 (June 1980); PETER B. BEAUMONT, "The Ancient Pigment Mines of Southern Africa," *South African Journal of Science,* 69:140–146 (May 1973); J.R. MASSON, "Rock-paintings in Swaziland," *South African Archaeological Bulletin,* 16:(64):128–133 (December 1961); J.S.M. MATSEBULA, *A History of Swaziland,* 3rd ed. (1988); CAROLYN HAMILTON (ed.), *In Pursuit of Swaziland's Precolonial Past* (1990); PHILIP BONNER, *Kings, Commoners, and Concessionaires: The Evolution and Dissolution of the Nineteenth-Century Swazi State* (1983); and HILDA KUPER, *Sobhuza II, Ngwenyama and King of Swaziland: The Story of an Hereditary Ruler and His Country* (1978).

(J.R.M.)

Zambia. IRVING KAPLAN (ed.), *Zambia, a Country Study,* 3rd ed. (1979), provides introductions to all aspects of the country. D. HYWEL DAVIES (ed.), *Zambia in Maps* (1971), illustrates most aspects of the Zambian scene. Descriptions and maps of the traditional land use systems are found in JÜRGEN SCHULTZ, *Land Use in Zambia,* 2 vol. (1976). ROBERT E. BALDWIN, *Economic Development and Export Growth: A Study of Northern Rhodesia, 1920–1960* (1966), is a short but valuable analytical study by an economist, the closest approximation to a general economic history of Zambia. A.L. EPSTEIN, *Politics in an Urban African Community* (1958), is a celebrated study, both historical

and sociological, of the Roan Antelope mine compound and Luanshya township.

ANDREW ROBERTS, *A History of Zambia* (1976), is an overview. Colonial history is detailed in ROBERT I. ROTBERG, *Christian Missionaries and the Creation of Northern Rhodesia, 1880–1924* (1965); L.H. GANN, *The Birth of a Plural Society: The Development of Northern Rhodesia Under the British South Africa Company, 1894–1914*, 2nd ed. (1968, reprinted 1981); ANDREW ROBERTS, *A History of the Bemba: Political Growth and Change in North-Eastern Zambia Before 1900* (1973); and GWYN PRINS, *The Hidden Hippopotamus: Reappraisal in African History: The Early Colonial Experience in Western Zambia* (1980). A more specialized account of the colonial period can be found in BRIAN GARVEY, *Bembaland Church: Religion and Social Change in South Central Africa, 1891–1964* (1994). More recent events are discussed in ELENA L. BERGER, *Labour, Race, and Colonial Rule: The Copperbelt from 1924 to Independence* (1974); WILLIAM TORDOFF *et al.* (eds.), *Politics in Zambia* (1974); and MARCIA M. BURDETTE, *Zambia: Between Two Worlds* (1988), which reviews developments since independence with a focus on mining and the ailing economy. WILLIAM E. RAU, *A Bibliography of Pre-Independence Zambia: The Social Sciences* (1978), is a basic reference tool; it is complemented by GEOFFREY J. WILLIAMS, *Independent Zambia: A Bibliography of the Social Sciences, 1964–1979* (1984), covering the early years of independence. (G.J.Wi./A.D.R./Ed.)

Zimbabwe. Discussions of the country's geography, society, economy, and history are available in HAROLD D. NELSON, *Zimbabwe, a Country Study*, 2nd ed. (1983). Political economy is addressed by J.D.Y. PEEL and T.O. RANGER (eds.), *Past and Present in Zimbabwe* (1983); IBBO MANDAZA (ed.), *Zimbabwe: The Political Economy of Transition, 1980–1986* (1986); IAN PHIMISTER, *An Economic and Social History of Zimbabwe, 1890–1948: Capital Accumulation and Class Struggle* (1987); and CHRISTINE SYLVESTER, *Zimbabwe: The Terrain of Contradictory Development* (1991).

ROBERT BLAKE, *A History of Rhodesia* (1977), includes a commentary sympathetic to the white Rhodesian leaders. The early history of the country is detailed in D.N. BEACH, *The Shona & Zimbabwe, 900–1850: An Outline of Shona History* (1980); S.I.G. MUDENGE, *A Political History of Munhumutapa, c. 1400–1902* (1988); PHILIP MASON, *The Birth of a Dilemma: The Conquest and Settlement of Rhodesia* (1958, reprinted 1982), the best account of the early days (up to 1918) of white settlement and race relations; T.O. RANGER, *Revolt in Southern Rhodesia, 1896–97* (1967, reissued 1979), a full-length study, drawing from African sources, of the risings against white rule in 1896–97, with significance in terms of the modern liberation movement; ROBIN PALMER, *Land and Racial Domination in Rhodesia* (1977); ANTHONY VERRIER, *The Road to Zimbabwe, 1890–1980* (1986); T.O. RANGER, *The African Voice in Southern Rhodesia, 1898–1930* (1970); and CHARLES VAN ONSELEN, *Chibaro: African Mine Labour in Southern Rhodesia, 1900–1933* (1976), a major pioneering study in social history. LAWRENCE VAMBE, *An Ill-Fated People: Zimbabwe Before and After Rhodes* (1972), a family history portraying the humour and sadness of occupation, is continued by his *From Rhodesia to Zimbabwe* (1976), on the years from 1927 to the early 1960s. More recent history is studied by NATHAN M. SHAMUYARIRA, *Crisis in Rhodesia* (1965), a broad description of the racial disparities and political collisions that culminated in the Unilateral Declaration of Independence; RICHARD HALL, *The High Price of Principles: Kaunda and the White South* (1969); MARTIN MEREDITH, *The Past Is Another Country: Rhodesia, UDI to Zimbabwe*, rev. and extended ed. (1980), a detailed and objective account of political moves inside Rhodesia from 1965 to 1979; T.O. RANGER, *Peasant Consciousness and Guerrilla War in Zimbabwe: A Comparative Study* (1985); NORMA J. KRIGER, *Zimbabwe's Guerrilla War: Peasant Voices* (1992); DAVID MARTIN and PHYLLIS JOHNSON, *The Struggle for Zimbabwe: The Chimurenga War* (1981), an authoritative account of the liberation movement; and W.H. MORRIS-JONES (ed.), *From Rhodesia to Zimbabwe: Behind and Beyond Lancaster House* (1980).

(C.W.S./K.Br./K.In./Ed.)
